Gardeners at the Chiswick Exhibitions.—I perfectly agree with your remarks in your Leading Article in No. 21 of the *Chronicle*, which has reference to the late Horticultural Show at Chiswick. There is no doubt that the appearance of the gardeners at this Show reflected much credit upon them, when compared with former years; and I do trust on all future occasions they will be found equally attentive to their personal appearance. The gardeners and nurserymen ought to have an opportunity given them, at each Show, an hour or half an hour before the public are admitted, to examine the productions offered for competition, and to make their notes on and discuss amongst themselves the improvements which every season brings forth. This would be a great boon to those gardeners and nurserymen who really come to these Shows for the purpose of increasing their stock of knowledge; and it must be admitted that too much encouragement cannot be given to those men, on whom we are so much dependent for the splendour of such exhibitions. The public would feel the advantage of this, as it would do away with the inconvenience which now but too often occurs, by persons, evidently gardeners or nurserymen, impeding the progress of the public round the tents, while they are making their notes and taking the names of whole collections. This was done at the last Show in several instances. I cannot blame these persons for taking their notes—it is necessary for them to do it; but I do hope the Society will give them an opportunity of doing so much more conveniently to themselves, and at the same time relieve the public from the inconvenience alluded to. There is another point to which I wish to call your attention, and which, in my opinion, and in the opinion of many persons who attend the Chiswick Shows, detracts much from their interest. This arises from the award of the judges not being placed upon the successful collections, specimens, seedlings, &c. I really do not believe there is a person who takes the trouble of going round the tents who would not have an increased interest by having the attention called to the successful productions. It is impossible to recollect the names of all the successful parties by merely reading the award over in a hurried way; and to stop to copy it is out of the question.—*J. S. J.* [Our correspondent is perhaps not aware—1, that gardeners are admitted into the garden before half-past 8 in the morning, and remain there till 10, during which time they have every opportunity of making notes; 2, that their passes are given them upon the express condition that they shall not loiter in the tents in the afternoon; 3, that it is apparently impracticable in such crowds to manage the announcement of the awards in any other than the present way. The award cannot be completed before half-past 2 or 3 o'clock, and at that time the tents are so thronged as to render it impossible to get at the tables.]

Covering Fruit-trees with oiled Calico.—In December, 1843, I bought a quart bottle of Whitney's Composition, and applied it in the way directed by him, but could not make it go so far as I was led to expect; it gave two good coats to a frame five feet eight inches long and three feet six inches broad. I prepared five other frames with the composition described by "Devoniensis," at page 301, 1843, at one-fourth of the expense. In the effect produced I could perceive no difference, nor could any one else, although both kinds of material were over the same tree. Both were sufficiently transparent. On the 7th March, I protected one Peach-tree, one Nectarine, and one Apricot, with these frames, none of the trees being large. All three had blossoms in abundance, and the season was more favourable than usual here; but all the trees had less fruit set than last year, in an ungenial season, and without any protection whatever. The Peaches and Nectarines under the frames were covered with blistered and curled leaves and aphides. As I could not have less fruit nor less healthy foliage, I removed the frames in May to try them again next year, when I hope to have more success. Will such of your readers as may have tried these frames for protection, give the results of their experience thus far, whether for or against?—*Rambler.*

Rabbits.—Instead of using such a dangerous substance as arsenic for the destruction of rabbits, in the manner described by "J. G." at p. 245, or resorting to the less objectionable method pointed out by "J. R. L." at p. 317, I would beg to suggest the adoption of another expedient, which will be found quite as serviceable as either of those above referred to. It is nothing more than the fixing of some small twigs around the plants that require protection, and afterwards coating them with coal-tar. This I have practised for several years past, and have found it answer the purpose as effectually for a time as if the plants had been surrounded with a wire guard. Of course, when the tar dries, and the smell wears off, it will be necessary to rub over the twigs a second time; but this is done with very little trouble or expense, and its effects will probably last until the plants are hardened and grown beyond the reach of hares or rabbits.—*M. E. H.*

Oak Bark.—Is the bark of the Levant Oak (Qu. Cerris) valuable? and what proportion of the tanning principle does it afford, compared with the English Oak?—*H. B.* [Can any correspondent favour us with an answer to this question?]

Miscellaneous.—*A Correspondent* states that the finest specimen of a Lemon (?) China Rose which he has ever seen, is in a conservatory near Ryde, Isle of Wight. He writes that the plant is about thirteen feet high, and ten in width, and has at this time bloom and buds ready to expand, to the number of nearly one hundred.——In reference to the statement made at p. 318, *H. G.* informs us that at his last residence, which was in the West of England, he invariably sowed Sphenogyne speciosa in the open ground. He adds that he has done the same this season near Elgin, and remarks that the plants are certainly more than an inch long.

Societies.

HORTICULTURAL SOCIETY.

[We have received the following correction from Mr. Frazer, of Leyton:—In your Report of the climbers exhibited by us at the Gardens of the Horticultural Society, on the 18th inst., we are stated to have exhibited Philibertia grandiflora, so trained as not to cause its blossoms to be seen. This plant we did not exhibit at all, and do not wish to have the discredit of showing it.]

LINNEAN SOCIETY.

Anniversary, May 24.—The BISHOP of NORWICH in the chair. Mr. Sowerby exhibited specimens of a flowering plant of Leuceria runcinata from Chili, which had been grown in the Royal Botanic Society's Garden, Regent's Park.—Mr. Cameron exhibited a specimen of

Pyrola uniflora in flower, and the frond of the Cibotium Barometz, both from the Botanic Garden at Birmingham.—Mr. Edward Forster read the Treasurer's account, when it appeared that the Society, during the past year, had received 928*l.* 16*s.* 2*d.*, and expended 953*l.*, including the payment of two 100*l.* bonds. The balance in favour of the Society on the year's account was 182*l.* 1*s.* 1*d.*—Mr. James Bennett, the Secretary, then read an account of the members who had died during the past year, amongst whom were the following:—J. B. Hogg, Esq.; G. W. Wood, Esq.; W. Allen, Esq.; J. C. Loudon, Esq.; J. M'Cartney, M.D.; Don Jose Pavon, and Baron Voght. The following is a list of the Members of Council removed:—Arthur Aikin, Esq.; J. A. Hankey, Esq.; Rev. F. W. Hope; John Miers, Esq.; Professor Owen. The following gentlemen were proposed as members of Council:—Dr. Boott; Prof. Forbes; Rev. W. Hincks; D. Sharpe, Esq.; W. Spence, Esq.; C. C. Babington, Esq.; E. J. Quekett, Esq. The five first were elected. The following officers were re-elected:—*President*—Edward, Lord Bishop of Norwich, D.D.; *Treasurer*—E. Forster, Esq.; *Secretary*—J. J. Bennett, Esq.; *Under-Secretary*—R. Taylor, Esq.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

STATICE PSEUDO-ARMERIA. False Thrift. (*Herbaceous perennial.*) Plumbaginaceæ. Pentandria Pentagynia.—Every one acquainted with flowers knows the common Thrift, which grows so abundantly on our marshy sea-shores; and the beauty and desirable properties of which have rendered it a favourite so generally esteemed and so extensively grown, that few gardens are unadorned with its simple and lasting flowers. This species has many traits of a kindred character. Like it, the flowers are collected and arranged together in a dense and somewhat globular head, supported on a scape which raises and shows them prominently above the foliage. They also possess the same pleasing colour and enduring nature, continuing unchanged in beauty for a long time. But it is only in some of the varieties of S. armeria that the colour of the present is equalled, or even approached, for we find many with very pale flowers; and none of them under any circumstances rival it in the magnitude of the flowers. In fact, the plant is altogether of a much larger size, and superior character. The foliage, too, of S. armeria is very narrow, and so thickly arranged that it has become eminent as a desirable plant for border edgings. But a different character is exhibited in the plant before us, and we are not aware of any other species of the capitate flowering section of the genus that has leaves of equal breadth. As an ornamental plant for the greenhouse or drawing-room, it has considerable merit, being easily grown, and always flowering with freedom. And there is little doubt but it will also admit of being gently forced into early bloom; if attempted, however, it will be quite necessary to observe a degree of caution, for too high a temperature produces weak and drawn-out flower-stalks, which are unable to support the cluster of flowers in an upright position; and it has also a tendency to detract from the merit of the blossoms, in causing them to be fainter in colour. To the flower-garden it will likewise be an acquisition of some importance, if planted closely in beds. We have not learned that its hardihood in enduring the severity of our winter without protection has yet been sufficiently tested, but it is not unlikely that it may eventually be found to need little or no shelter. Respecting its native country, we have been unable to gather any information. Messrs. Rollisson, of Tooting, received plants of it from the Jardin des Plantes, in Paris, in the summer of 1841; but these were unaccompanied with any memoranda. Probably, with several other members of the genus, it is a native of the South of Europe.—*Paxton's Magazine of Botany.*

MACLEANIA LONGIFLORA. Long-flowered Macleania. (*Greenhouse Shrub.*) Vaccinieaceæ. Monadelphia Decandria.—When Sir William Hooker named a plant Macleania, he not only paid a well-merited compliment, for few British merchants have deserved better of Botany than Mr. John Maclean of Lima, but he founded a good genus. A less accurate observer might indeed have referred it to Thiebaudia, a group of plants from the same countries, and very similar in habit; but each anther of Thiebaudia is divided into two long tubes, which open at their point; while, on the contrary, in Macleania the anthers have only one tube each. The plant now described is very near M. angulata, figured in the Botanical Magazine, t. 3979, and said to be from Peru. But that species has shorter and broader leaves with manifest stalks, and the flowers are also shorter, contracted at the orifice, and yellow there. Their colour, too, is represented as much more vivid than in our species. A warm greenhouse shrub, which requires to be kept in an intermediate house during winter. It may be potted in a compost, consisting of sandy loam and peat in equal proportions. Owing to its producing very fleshy roots, a large pot or tub will be required, or where there is convenience it is probable it would succeed well if planted out in a conservatory. It requires a liberal supply of water in summer, but very little in winter. To have this plant well furnished with young wood from the bottom for flowering, it is necessary to cut it well back early in autumn, in order to have the plant clothed with leaves before winter. It is rather difficult to multiply, but may be managed under a bell-glass in a bottom heat of 80°. *Note by Mr. Hartweg.*—This is one of the numerous fleshy rooted vaccinaceous shrubs, frequently met with in dry and exposed situations in the Andes; the present species has been collected on the main Cordillera near Loxa (4° S.) at an elevation of about 8000 feet above the sea, where it forms a neat compact evergreen shrub, five feet high, and is called by the inhabitants Salapa.—*Botanical Register.*

Garden Memoranda.

New Tarbet Gardens.—New Tarbet, formerly the seat of the Earls of Cromarty, is situated about four miles north from Invergordon, and about a mile from the public road. Where the approach branches off the road there are some cottages which, from their being completely covered with Ivy, would not be unaptly named the Ivy Cottages. The Ivy appears to keep the walls very dry at all seasons, and when it is neatly clipped and kept close the healthy foliage has a neat appearance. From these cottages the approach sweeps through thriving plantations, until it reaches the house, which is situated on a level piece of ground, and is a modern structure, built of hewn freestone. It has a flat roof, from which an extensive view of the surrounding country is obtained, and to the lover of Nature in her wildest grandeur the scenery around New Tarbet must afford admiration and delight. On the east is the broad expanse of the German Ocean; on the south-east the Moray Frith; on the north-east Dunrobin Castle, the seat of the Duke of Sutherland, and John O'Groat's coast; Balnagowan Castle overtops thriving woods on the north; and on the north-west mountainous scenery prevails, in which Ben Wyvis stands pre-eminent, streaked with wreaths of snow throughout the year. Passing from the house to the garden, we cross a steep declivity by an easy pathway. This bank continues through the spacious lawn for at least a mile, and in some parts it is finely broken into rude natural shelves, that somewhat resemble the artificial terraces of the present day. It is richly decorated with large trees, that rise from among underwood, consisting of Laurels, variegated Hollies, Rhododendrons, and other evergreens. Some of the Laurels measure 30 feet in diameter, and are not more than 6 feet high. Roses and hardy Heaths occupy the front of the borders next the walks, intermixed here and there with patches of Violets. Throughout this bank American plants grow remarkably well, and produce annually young shoots nearly 3 feet long. These are pegged down close to the ground; they are covered with broad healthy foliage, and the flowers are of surpassing richness and beauty of colour. The soil being naturally a mixture of peat, sand, and loam, is particularly suitable for Rhododendrons. The kitchen garden is a parallelogram, and contains about 4 Scotch acres of land. The walls are covered with fruit-trees, many of which, in the middle of April, appeared as sheets of blossom. Apricots, Plums, Figs, Almonds, Cherries, Mulberries, and even the best varieties of Pears ripen well here, and Peaches bear abundant crops of excellent fruit. This is somewhat remarkable, when we take into consideration the fact that Tarbet is 700 miles north from London. The greenhouse was gay with Camellias, Heaths, Pelargoniums, Hoveas, Chorozemas, Pimeleas, and other plants. On the walls were Roses, among which was a fine specimen of yellow China. A slip of ground round the garden is planted with shrubs and trees, among which are some beautiful Weeping Ashes, above 25 feet high, with long streaming branches sweeping the ground. On the east of the gardens is a range of pits, set on arches, and heated by means of hot water, occasionally aided by dung-heat. Mr. Proctor, the gardener at New Tarbet, is a successful grower of Coniferæ, and had, in pots, as many as 500 young plants, which he had raised from seeds. Among these I observed Pinus Gerardiana, P. cembra, P. ponderosa, Abies Deodara, and many other good species. Timber-trees, such as Beech, Elm, Ash, Yew, &c., grow remarkably fine at New Tarbet. Some of the Beeches are nearly 100 feet high, with clean stems. The gardener's cottage deserves notice, as being very ornamental; it is in the Gothic style, and neatly finished both outside and within. Among other books on science and gardening, its library contained three volumes of the *Gardeners' Chronicle*, handsomely bound, having been supplied to the gardener through the liberality of his employers. In conclusion, I would state that the whole place is in good keeping, and reflects much credit on the gardener.—*A Visiter.*

Miscellaneous.

The Upas Tree.—A living plant of this celebrated tree has been lately presented to the Horticultural Society by the East India Company, and is now growing in the Chiswick Garden. It is in perfect health, and, notwithstanding the fables of Dutch travellers, perpetuated by Darwin, may be approached with safety. It is, however, so virulent a poison that no prudent person would handle it without proper precaution. Along with it the Company also presented a new species of Cycas, and a young plant of the Durian fruit.

Singular Tree in New Zealand.—One of the most extraordinary trees of the forest is the Rata, which, originating in a parasite, grows to such a size as to rank amongst the giants of the forest. It first makes its appearance in the form of a tender Vine, clasping the trunk of some huge tree with its long tendrils, and growing both upwards and downwards, and increasing in bulk at the same time. After a while the parasite, having killed the parent trunk, establishes itself upon its roots, sends forth numerous branches aloft, which again send forth aerial roots clasping the neighbouring trees—and, ultimately, the Rata occupies a larger space than any tree of the forest. It is under this tree that the curiosity so well known as the vegetating caterpillar is found; and instances have occurred of natives lying down to sleep under the Rata having been found dead. The tree is now always carefully avoided by them.—*Simmonds' Colonial Magazine.* [The Rata is the Metrosideros robusta, a very handsome plant, and of singular habits, by no means satisfactorily explained. If natives have been found dead beneath it, their death was owing to any cause rather than the Rata, which is as harmless as a Myrtle.]

Rot in the Potato.—We learn from our St. Helena correspondence, that the Potato crop in that island has of late years been visited by a disease of a most destructive character. In a letter now before us, the writer states that "the rot in the Potato continues, but has not been so prevalent during the past year. Many experiments have been tried to arrest the evil, but with very partial success. Deep trenching and planting without manure have in several instances been of great benefit, but in other cases they have failed. Using seed from a crop not ripe has also succeeded; but although these experiments have answered on some grounds, in others they have utterly failed. The guano, as a manure, has been used, but no results have yet been obtained. The rot generally begins when the Potato crop is in flower, the stems being then strongest and apparently out of danger. From the most luxuriant state of vegetation, the crop, when taken with this disease, will dry up and disappear in the course of a few days; and it frequently occurs that not a vestige of the Potato is to be found; when not destroyed, the Potato is generally in a foetid rotten state, and covered with wireworm. Many consider the rot to proceed from the wireworm; I am not disposed to adopt this opinion, but think the incipient rottenness of the Potato attracts it. Two crops of the Potato are obtained annually, the first, sown in July or August (which months are here considered the winter months, the thermometer in the country ranging from 55° to 60°), and gathered in December and January; the second crop is usually planted in January and February, summer months, when the thermometer ranges in the country from 70° to 75°." Does any one know of such a disease in this country?

The King of Saxony.—Our readers may not be aware that His Majesty, now on a visit in this country, is not only a botanist but a botanical author; having published an account of the plants in the neighbourhood of Marienbad. The king is said to have acquired very considerable practical knowledge of the science by long pedestrian excursions on the mountains of Germany.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

CLERODENDRONS, VINCAS, and other stove plants intended to flower in the conservatory through the summer, should now be removed to the coldest part of the house, or, what is better, into a late vinery. I hardly know of a stove-plant which may not be thus inured in summer to flower in the conservatory. All the Orchidaceæ are well suited for this purpose, and as few ladies can endure the close heat of our stoves, unless the inmates of these houses are so managed their beauty is in a great measure lost.

Conservatory.—New conservatories, where a collection of climbers has been planted this spring, should now be kept as hot as a stove, and as damp as water can make them day and night; it is bad policy to use the common routine for such a house the first season. We often hear of large conservatories getting too hot and injuring the plants in summer: but it is the want of moisture in the atmosphere, and not the heat, which causes the mischief; and when this becomes better understood, designers of these structures will make better provision for moisture than has hitherto been done, except in a few instances. All spare places and under the stages in any conservatory, should now scarcely ever get quite dry.

Greenhouse.—Keep this house moist by frequent syringing; turn the specimen-plants round from time to time, that they may not get one-sided, and allow them to have plenty of room on all sides, which is the grand secret in growing these plants to perfection. The flower buds of such young plants as are intended to become specimens ought to be picked off, in order to encourage their growth, and few of the best old specimens should be allowed to ripen seeds.

Forcing Pits.—Put in cuttings of Neriums about this time, to be forced next spring for early bloom. Let such as are going out of flower be cut to the second pair of eyes next the bottom, and plunged in bottom-heat. Force them rapidly for two months, and then inure them by degrees to stand the greenhouse, and afterwards out of doors till the frost comes. Keep them as cool as possible, and nearly dry through the winter, and they will come in for forcing early in spring; they may be made to flower all the summer. There is hardly a plant in cultivation more capable of improvement than the Oleander.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.—As we have at length got a soaking, though a very cold one, of rain, it will not be necessary for me this week to do more than direct attention to former Calendars, and urge the necessity of bringing the work up as fast as possible. Where the Grass on lawns is much burnt by the late weather, it will assist it much in recovering its verdant hue to dress it either with liquid manure, or some of the new concentrated manures considerably mixed with light sandy soil. A little lawn Grass and Dutch Clover seed, thrown on previously to covering with soil, will do much good, especially on spring laid turf, where soil to fill up the cracks is indispensable. Mow, roll, and sweep lawns and walks, and keep everything and every place as clean and tidy as possible. Annuals may now be advantageously thinned, and the thinnings if not too large may be used for filling up gaps in the borders.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auriculas.—Seedlings must be shaded from the glare of the midday-sun, and especially watch the attacks of Aphis or green-fly, which usually secrete themselves in the heart of the plant, and multiply amazingly this hot weather. If you wish to save yourself a great deal of trouble you will remove them as they appear. Place two or three flat oyster shells on the surface of the soil in the large pots: it prevents evaporation, and also saves the roots from being washed bare in watering them. *Polyanthuses* are very subject to attacks of red spider; to keep these pests down, shade your plants, and if on a bed keep the soil moist around them. *Tulips.*—Break off the capsules to strengthen the roots. The bulbs on the offset beds will soon be ready to take up, should dry weather continue. *Ranunculuses.*—Many complaints reach me of roots rotting in the ground. In experimenting this season I have destroyed a valuable bed. I do not, however, consider it all loss, as I certainly have gained some experience, which I trust the readers of the *Chronicle* will profit by, before the next period of planting. *Carnations and Picotees.*—Use every means before recommended, to keep your plants free from Aphis; if they get ahead your bloom will suffer severely. Tie up diligently, and top dress with some very rotten manure. *Pinks* do not appear so liable to the green-fly as the before-mentioned flowers. Watch your seedlings, and those which are single or with serrated leaves "pull up." They are not only worthless, but their removal will benefit those which remain. *Pansies.* Still continue to put in cuttings; those slipped off nearest the root succeed best. The thinner they are the better; strong shoots seldom make good plants. *Dahlias.*—The stakes ought to be put down without delay, and the plants will be better for being mulched with rotten manure.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Whether the plants intended for ripening their fruit, from the beginning of October through the winter, are already in the fruiting-pit, or in a pit by themselves, they should now be carefully examined, to see if any of them are near showing their fruit. Those with which this is found to be the case, will be benefited by being either top-dressed with some rich turfy-loam, shifted into larger pots, or turned entirely out into the bed to root into it at pleasure, which they will readily do. The last-mentioned plan is the one which I adopt myself, and with favourable results. I generally put about half a bushel of chopped turf, with a little "flakey" leaf-mould round the ball, for the roots to strike into, and give one good watering, after which they only require to be occasionally syringed.

Vineries.—In removing partially the linings from the borders of the early Vineries, I find that the roots have run considerably into the decayed part below, which has not been regularly turned with the other. As this is not desirable, it will be advisable in turning that on the later Vine borders, to keep the littery part next to the surface of the border. In removing the covering, leave three or four inches of the part, to serve as a mulching, as the roots will be numerous near the surface, and should be not only protected from the effects of drought, but encouraged as much as possible to remain there. The berries in the late houses will now require thinning. Let this have timely attention, and stop the laterals as soon as

they are a few inches in length. Be careful not to syringe Grapes after they are stoned, as the bloom is never so fine upon them if syringing is continued too long. Keep a dry night atmosphere.

Peaches.—As the first house of this esteemed fruit is, in many gardens, now beginning to ripen, it may not be amiss to repeat that heat, accompanied by plenty of air during the day, is necessary to give flavour and colour to the crop; and on the occurrence of sunless days, I have made slight fires to raise the temperature, rather than keep the house close. From 65° to 70° degrees by night, with a dry atmosphere, must be maintained. The second house will require the strictest attention to watering the borders, and syringing the trees.

Fig House.—Continue the treatment recommended in former calendars. Young trees will require constant attention to stopping the more vigorous shoots, so as to obtain a proper supply of side-shoots and spurs.

Melons.—Pay attention to the renewing of linings when required, lest in case of dull weather occurring the plants should receive a check. Be careful to supply them with sufficient water. A few seeds should now be sown for the last crop.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Fig-trees.—Pinch out the points of shoots that are rather rampant; this will cause the young fruit to swell better, and will have a tendency to render the shoots more fruitful. In making a fresh plantation, secure a dry situation, and keep the plant growing from one stem, as the sucker-like appearance which our Fig-trees generally present is a great drawback to their proper management. Vines in favourable situations should have the fruitful shoots shortened an eye beyond the bunch, and these shoots so thinned, that the Vines will be able to perfect the bunches. Hoare's system of management is the best for open walls in general cases. *Cucumbers and Mushrooms.*—Get your ridge Cucumbers out as soon as possible; there is nothing gained by planting them earlier, where you have any frames at command. The beds I have put up consist of 6 inches of long Grass put in a trench, and covered with 4 inches of half-rotted dung. On the dung, Mushroom-spawn was inserted, and the whole covered with 2 inches of soil; 6 inches more soil were placed under each hand-light. The Mushrooms will not appear until the stems of the Cucumbers, &c. will have so extended, that their leaves will shade and keep them cool. I have tried the same plan with beds of Carrots, &c., but the pulling of the crop disturbs the spawn. Many schemes must be tried to obtain good Mushrooms during summer, where materials are scarce, and shady places and cool cellars not to be obtained.

Endive and Chicory.—Sow a little for early use, and a greater breadth of each by the middle of the month. Chicory will make large heads, if transplanted thinly into rich soil. If fine roots are an object, treat it much the same as you would do Carrots.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—If there has been any felling and peeling done this season, after the bark is dried and removed, the timber, faggots, and loose stuff should be cleared away as soon as possible; fences should be repaired, so that the young shoots that spring from the stools may be secure from injury; this is a matter of much importance, and should therefore be strictly attended to.

Coppice.—Where felling and peeling has been performed this season, the woods should be cleared of all the produce as quickly as possible.

Young Plantations.—If quick and profitable growth is wanted, after the plantations are made, the directions which I have so often given respecting their after management should be borne in mind, and, what is of more importance, put in practice, particularly during the growing season.

Nursery Work.—This has been a trying season for transplanted seedlings, plants, and trees; many may, however, yet be saved that are apparently dead or dying, by heading them off, or cutting them well in. Shading and watering should also be attended to.—*W. B.*

State of the Weather near London for the week ending May 30, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 2nd, 1834—therm. 85°; and the lowest on the 3rd, 1837—therm. 35°.

Notices to Correspondents.

ANEMONE AND RANUNCULUS.—*Rugby.*—It is most probable that the compost used for the Anemones was too rich. The failure in your Ranunculus bed has arisen from the season, the prevailing cold winds, and the long-continued drought*.

BEES.—*Geo. Payne.*—Your letter is an advertisement in disguise.

CHICORY.—*A Subscriber.*—As we obtain more information upon this new branch of cultivation we will give it. The mode of preparing it is merely to cut the roots into squares, the size of dice, kiln dry and roast them. Whether it is an improvement to Coffee is a matter of taste. Those who want to have their nerves excited by the beverage will prefer pure Coffee; but those who wish for wholesome, agreeable beverage, and do not want the excitement, will prefer Chicory, which, in our opinion, greatly improves both the quality and the effects of Coffee upon the system. We do not know anything about Mangel Wurzel beer; but no doubt it would make, when fermented, a strong and harmless beverage.

DAMSONS.—*Expansa.*—The Shropshire and Common Damsons may be reproduced nearly of the same quality from the stone.‖

DISEASES.—*Omikron.*—We have fully discussed your case in a Leading Article. The Peach trees from your *vinery* are no doubt ill ripened, but in a less degree than those in the open air. Smith's book is useful; but you will find the short instructions in the late Mr. Lindley's "Guide to the Orchard," containing all that need be, or can be said, to any good purpose, upon the management of the Peach tree.

FIGS.—*Thomas Milne.*—Two of the best varieties for planting against a south wall are the Brown Turkey and Brunswick.‖

FUCHSIA SEED.—*Elizabeth.*—As the seeds of Fuchsia do not require more than a temperate heat to cause germination, it is probable that the vital principle has rather been suspended than quickened. They will most likely remain six weeks or even two months longer. Keep the soil in as uniform a state of moisture as possible, and, rather than allow it to become parched, place an inverted flower-pot, dish, or pan, resting it upon the rim of your seed-pot, during intense sun-light, and during all other times allow the pot to be exposed. The above precaution is a good expedient, where external shading is impracticable or inconvenient. Plants, generally, cannot have too much light, when modified with other agencies; but, with seeds, it is *vice versâ* up to the period of germination. *W. W.*

GARDEN TOOL.—*Chemical Jack.*—The accompanying woodcut represents a good description of Garden Tool for rooting up Dandelions, Docks, &c.

GRAPES.—*Dido.*—The extremities of your Vine-shoots have been checked by cold.‖ —— *A Young Grape grower.* — The prizes awarded for Grapes by the judges at the Chiswick Exhibitions are not solely according to the weight of the bunches; the whole of their merits, as regards handsome bunches, size of berries, colour, and flavour, are taken into consideration.‖

GRASS CUTTINGS.—*C. B.*—It is not so well to fork the short Grass with which you have mulched your American bed into the ground before it is decomposed, as to remove it and leave it in heaps till decayed.

HEATING.—*Cornish.*—There is no reason why you should not use closed slate tanks for heating the air of your house, provided the Delabole quarries will furnish a material that will stand heat. But some kinds of slate split when heated, and therefore cannot be employed instead of pipes, &c. You could easily divide the interior from a tank, by a contrivance like that at p. 804, 1843, from Mr. Beck's garden, and so work the two halves independently of each other.——*N. J. A.*—If a boiler heated with a powerful lamp will keep frost out of a greenhouse, so would the lamp without the boiler, provided the loss of heat can be prevented. We would, however, advise you to take a copper boiler such as we have mentioned. It requires no brickwork, or setting, but can be used just like an Arnott stove. Only you must take care to place such a stove in the middle of your tiny greenhouse. Loudon's "Suburban Gardener" would probably answer your purpose.

INSECTS.—*P.*—The bunches of Currants from the Oak, are galls formed by a Cynips, called, I believe, Quercus pedunculi—specimens of which accompanied the Oak-twig. We will take the first opportunity of illustrating this subject. *R.*——*O. L.*—Your insect is the larva of a beetle called Timarcha tenebricosa; it feeds upon Goose-grass very freely *R.*——*B.*—The insects infesting your Cucumber-plants are a species of Thrips, no doubt, but the leaves being quite matted together by pressure, none could be found. They may be extirpated by fumigation. *R.*—*Myrtle* —The beetles destroying your Peach-leaves are the Curculio tenebricosus. The blighted foliage is either occasioned by aphides or mildew. The Clover is the Trifolium pratense. *R.*——*A Constant Reader.*—At p. 509, vol. II., of this Journal, the history of the Froth-fly was given. The eggs are supposed to be deposited on the young twigs or buds, which are formed to produce leaves the succeeding spring: we hope you will be able to confirm or refute this opinion. *R.*——*T. M.*—We cannot say that the snails do not eat the roots of your Orchidaceous plants, amongst which they, in all probability, breed—but that may easily be ascertained by a little attention at night. If Cabbage-leaves were strewed about the house, we presume these pests might be readily collected and destroyed. The leaves should be first held before the fire, to make them flaccid; and if a little fresh butter or fat be sparingly rubbed over the surface with the hand or a rag, it is said to make them more palatable. *R.*——*A Norman.*—The galls on your Oak-tree being unknown to me, I should feel obliged by your favouring me with your address, as I wish to investigate the subject without delay. The grub is the larva of a Crane-fly. The eggs were laid by a common white butterfly, Papilio brassicæ. *R.*——*A Subscriber.*—Please to send us, in a box, a portion of an infested leaf, with the insects upon it. The fumigation with sulphur must be repeated; and if the chinks be previously stopped, so as to render the frame air-tight, or nearly so, it must destroy the animals. You can place a saucer of spirits of turpentine in your frame; but we have had no experience as to its effects on Cucumber plants, and shall be glad to have your opinion. *R.*——*Delta.*—The only chance of getting rid of the Aphides, as you cannot employ fumigation, will be to put into your greenhouse all the Lady-birds (Coccinellæ) you can find; they will soon increase there, and clear off the enemy. *R.*——*J. D.*—I cannot give you the specific name of the Julus, from Calcutta, for which I am much obliged. *R.*——*K. O.* will find the Apis lanigera figured and described at p. 116, 1844. *R.*

MANURES.—*J. McI.*—It is an incontrovertible principle that the best manure which can be given to a plant is the same species in a decayed state, with the addition of such matters as are lost in the process of decay. Therefore Peach-cuttings are the best manure for Peach-trees, as far as they go. But, since a good deal of matter in the form of fruit and flowers is carried off and cannot be restored, other matter in aid of the Peach-cuttings would be necessary where the soil is exhausted. ——*J. H. H.*—Bone charcoal is a good manure, and is probably better than naked phosphate of lime; only that, as phosphoric acid is the important part of bone manure, much more bone charcoal than pure phosphate of lime would be required to produce a given effect.——*A Subscriber.*—All plants that like manure at all prefer it in its liquid form. They should have it weak and frequently, when in full growth. No coniferous plants will bear manure of any sort.

NAMES OF PLANTS.—*E. T. O.*—Brasavola nodosa.——*T. Williams.*—Myoporum adscendens—not an Anthocercis.——*A Subscriber.*—Sagina procumbens. The leaves of bulbs ought to be quite dead before they are removed.——*J. C. L.*—Aspasia lunata.——*A. W.*—1, Tillæa verticillaris; 2, Allium montanum; 3, Trichonema purpurascens; 4, Ruellia pumilio; 5, Pomax hirta. Pray do not send any more dried specimens.——*C. H. N.*—Some Libertia from New Holland; not a British plant.——*L. T.*—Chænostoma hispidum.——*Sussex.*—Gesnera tubiflora, a very fine thing.——*A. Z.*—Bossiæa microphylla.——*A. S. G.*—The pink variety of Hardenbergia monophylla. Depend upon it Kennedya coccinea had nothing to do with its parentage. Your "Moss" is the root of some plant that has found its way into the water.——*J. B.*—Cristaria multifida; the dwarf variety of Schizanthus pinnatus.——*J. M. Wirkham.*—Milla biflora——Δ.—Duranta Plumieri; Anigozanthos bicolor; Fuchsia, not in a state to be named: apparently gracilis.——*C. I. C.*—Cirrhæa saccata. Your Dendrobium speciosum will not flower without more heat than you give it. Moreover, it must be well rested for 3 or 4 months.——*A Lady.*—Ageratum conyzoides. On no account use guano to Coniferæ.

PEARS.—*Expansa.*—Now is the time to cover with soil the branch of your favourite Pear-tree which you have laid down with a view to its rooting; but you would better have the variety budded in July.‖

PELARGONIUMS.—*No. 43.*—We do not think decomposed Laurel leaves can injure your plants, because their poisonous qualities are volatile, and must have long since disappeared. Perhaps the leaves turn yellow and drop off in consequence of the house being too cold and dry. Your soil seems quite proper. Are you sure that Red Spider is not at work?

RHODODENDRONS.—*Anon.*—Your plants are dying from drought. They may probably be saved by a good top-dressing of cow-dung.

SUBSTITUTE FOR GLASS.—*N. W. Tanner.*—The specimen of cloth we have received, that has been rendered waterproof by your composition is, in every way, like Mr. Whitney's, and is equally transparent.‡

THE CUCUMBER.—*Ignoramus.*—It is no doubt the fashion among some well-bred persons to call a Cucumber a Cowcomer, but we never heard them assign any other reason for the practice than that they were accustomed so to call it. It was formerly usual to call Birmingham Brummagem, and Asparagus Sparrow-grass; Cowcomer is defensible upon the same ground as they are, and on no other. They are all the barbarisms of a fashion that is passing away.

WHITNEY'S COMPOSITION.—*G. W.*—Parties using this preparation are recommended to employ strong glazed calico or Irish linen, as it is equally transparent as muslin, and much more durable. I have growing under Irish linen Ispahan, Cuthell's, Mills's, and Scarlet Melons, in the greatest luxuriance: on the two former the fruit very fine, and nearly ripe plants, set 16th of April.*

MISCELLANEOUS.—*W. B.*—Of your plants, Nos. 1, 2, 3, and 5, are hardy; 4 is a stove plant. All are worth growing except 5. ‡——*A Friend.*—We would recommend you to speak to the party who supplies you with the Paper, as we do not ourselves fold a single copy at the office.——*George.*—We are greatly obliged by your good intentions, but would strongly recommend you to read more before you become an author. The paper would be a fair physiological exercise, but it contains views which more information and experience would alter, and is therefore unfit for publication. The term cambium is only another name for the organic mucus of vegetation. See "Lindley's Introduction to Botany," *passim.*——*Macready.*—Such a specimen as you describe can be exhibited at Chiswick under the letters DD.——*H. G.*—A very dry, light border under a hot south wall must necessarily be unfit for any plant whose roots do not penetrate deep. You had better give up all thoughts of growing Anemones and such plants in it. It would suit bulbs if they were put in by the end of September; but it would be more advantageous to fill it with China Roses and similar ornamental bushes, which will keep the place always gay or green, or both. If you will have herbaceous plants you must give the border every year a good dressing of cow-dung, with which one-sixth part of Peruvian guano is mixed. It would be greatly improved if you could add a good dressing of stiff loam.——*W. H. H.*—Your flowers were noticed last week under the initials "J. M. H."*——*W. K.*—You will find excellent practical directions for the management of Hyacinths at pp. 107, 1842, and 36, 1843 ‡——*X. Y. Zy.*—It is very uncertain whether the seed of your Pelargonium will produce a flower like that it was raised from. It is all chance. At the same time, it is probable that a handsome parent will produce a handsome seedling. In trying the experiment remove all the other flowers, so as to throw as much strength as possible into that you leave.——Will a *Connaught Gardener* be kind enough to give us his address?

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*R. P.*—Your seedling was too shrivelled.*——*H. N. B.*—Having examined your collection of seedlings, we do not feel justified, from what we have seen, in speaking of them in the terms which some parties have used who have seen them; we consider them rather behind the present improved race of this beautiful flower. Many of your varieties want form, others are common, such flowers as we have looked at years past; and many of them are very small. Such flowers as the Jewess, Dulcinea, Mrs. Coone, Anne, Eliza, are the best; Purity, Amulet, Emma, &c. are too long in form. The progress made this season in the Calceolaria has been very great.*

CINERARIAS.—*J. B. H.*—Of your seedlings, No. 1 is poor in colour; 2, we have much better in the same way; 3, fine blue; 4, fine blue, but petals too narrow; 5, very poor; 6, ditto; 7, ditto; 8, ditto; 9, there are many better of the same colour; 10, petals too narrow; 11, poor colour; 12, very good blue; 13, very common; 14, wants colour and size; 15, a bright and pretty crimson variety; 16, from the peculiar tint of the blue, makes a good variety; 17, disk too large, and petals too narrow.*——*I. B.*—Your seedling is distinct from others we have seen; dark disk, straw-coloured centre, having the petals tipped with crimson purple, with a darker stripe running down the centre of the petal, which gives it the appearance of being striped. We cannot say how it would look in a mass.*

FUCHSIA.—*J. W.*—There is nothing in your seedling Fuchsia to distinguish it from many others. It is large, altogether of a rosy crimson, and wanting the purple in the corolla.*——*W. G.*—As you justly observe, "the flowers of your seedling are not so large as many of the new varieties, but in colour, foliage, and habit, it is greatly superior to most of them." The colour of the tube and sepals are of a bright rich carmine, with a corolla of a beautiful purple.*

PANSIES.—*Z. A.*—Your flower, from not being packed up in wet Moss, was quite dry. From what we could see of it, it appears to be large, and of fine colour, texture, and substance.*——*J. P. Bath.*—The seedlings received with the above initials are magnificent specimens; they are the largest Pansies we have seen; but with their extraordinary size, they possess a certain degree of coarseness. Defiance, Emperor of China, the Great Mogul, have rough edges to the petals, and are not so perfect as stand flowers ought to be. The Sultana is much better in properties, and wants but the ground colour of a clearer yellow in the side petals, to make it a desirable Show flower. They are large, of good substance, and will be a great ornament to the border.*——*J. L. H.*—No. 9, a fair flower, but possessing no qualities particularly to distinguish it; 12 promises to be a much superior variety in form, and in the boldness of the eye. In texture it appears rather thin, but this may in part arise from the peculiar circumstances under which the blossom was expanded. 10 is a very fine flower in substance, colour, and form; there is a very slight dash of sulphur in the bottom petal, which it would be desirable it should lose. 11 possesses fine form, good substance, with a little too much orange in the lip. Your Jewess is also a very fine variety.*——*T. C.*—Your white seedling is fine in colour, and in the precise marking of the eye, but rather deficient in substance: and the edges of the petals have too uneven and fringy a character. No. 7 is a purple of the deepest dye, good in form, the edges of the petals even, thick, and of a velvety character.*——*Clericus.*—A large flower of fine proportion, named the *Marquis of Montrose;* the flower generally is of a rich purple, eye fine, ground colour white but little seen, and where it joins the purple it is mixed with blue, which gives it a blurry character, and the flower appears to want substance.*

PELARGONIUMS.—*P. P.*—The want of form is the great deficiency in your seedlings; the petals are all long, and too narrow, which gives the flowers a very loose appearance. The peculiarity you notice in No. 1 arises probably from its white centre.*——*G. L.*—Your seedling is a fair common flower, but it possesses none of the superior properties of a show-flower.*——*A Young Beginner.*—Your flower had fallen to pieces, but from the petals it appears to want form and substance. It is pretty from its extreme delicacy.*

VERBENAS.—*J. A.*—Your seedling Verbena, Enchantress, blush or pink, is a beautiful variety; truss large and well-formed, the flowers flat and large, with a fine surface and delicate colour; one of the best of the light varieties.*——*R. P.*—Your Verbena was quite shrivelled up on its arrival, and could not be revived.*

IMPORTANT TO BARLEY-GROWERS.—When the Crops of Barley and other Lent Corn have been injured by the long-continued Drought, they may be Revived by a judicious application of NITRATE of SODA, which may now be bought at a lower price than has been known for many years.—To be had in any quantities of J. SOLLY LISTER, 2, Laurence-Pountney-Hill, London.

The Agricultural Gazette.

SATURDAY, JUNE 1, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 5 — Agricultural Society of England.
THURSDAY, June 6 — Agricultural Imp. Soc. of Ireland.
WEDNESDAY, June 12 — Agricultural Society of England.
THURSDAY, June 13 — Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

June 3. West Hereford. W. Market. Yoxford.
June 5 Harlestone.
June 8 Monmouth.

THE value of BONE-DUST AS A MANURE has been long acknowledged. On looking over the Agricultural County Reports published by the Board of Agriculture in 1813, we find that in eleven of them mention is made of this manure, and that in some districts it was then used in large quantities. Thus the reporter for Derbyshire states that Mr. Bunting at Ashover used 100 bushels of bone-dust per acre for his Turnip-crop, which cost 20*d.* per bushel, and that the Rev. Edward Otter at Bolsover used 80 bushels per acre of London bones crushed, costing 2*s.* 3*d.* per bushel. The reporter for Lincolnshire states that Mr. Sutton of Alkborough manured with 60 bushels of bones from Sheffield, at 5*l.* per acre; the first year, the produce of Wheat was increased by them 6 bushels per acre; the Beans, the year after, yielded a quarter of the crop more; and the following year, the land being fallowed, "the Ketlocks (Charlock, or Wild Mustard) were vastly more luxuriant!" In other counties, also, this manure was then gradually coming into notice as a powerful fertiliser. The great point on which farmers who used bone-dust then, differed in practice from those who apply it now, was in the quantity applied. No one would think now of applying 100 bushels,* or three waggon-loads of bone-dust per acre. No wonder that land, as we are informed in some cases, should for years after such a manuring yield abundant crops without any subsequent assistance. But was the application on that account necessarily profitable or economical? By no means. Mr. Waterton, in his essay on "Alkali as a Manure," shows this very clearly. We republish a remark on this subject, to be found at page 157 of this Paper:—"It is a common observation amongst farmers to say, 'I have given such a field a dressing it will not forget for years.' Upon reflection, it must strike any one that this is a most improvident mode of proceeding." It is so, as is immediately afterwards stated by the author, for two reasons—1st, because the manure, if not all absorbed by the crop to which it is applied, is liable to waste during periods when the land is not under crop; and 2nd, because that portion remaining in the soil, after the first crop, is so much capital lying useless till the second and third or fourth, or, as in the instance just mentioned, till the twentieth crop, before which it is not all consumed.

This point seems soon to have come home to the minds of farmers; and now 16 or 20 bushels of bone-dust, or at the most 3 quarters, is the quantity generally applied. Within the last year or two, however, it has come to be known that this quantity may be diminished to an extraordinary extent, without interfering with the efficiency of the manure. The fact so well known that bone-dust has a powerful influence on the grain crop succeeding the Turnips to which it is generally applied, showed that in the condition in which it was ordinarily applied, it was not all at once available as vegetable food; and by altering the mode of this application—by presenting it as Mr. Lawes does in his superphosphate of lime in a soluble condition, one in which it can be immediately absorbed by plants, it is found that a very much smaller quantity possesses the same influence as the large doses of former years in causing luxuriance in the growth of one year's crop.

The fact—for it seems now to be pretty well established—that by dissolving 2 or 3 bushels of fine bone-dust in 40 or 60 lbs. of sulphuric acid, and applying this quantity of the mixture over an acre of land—the fact that as good a crop of Turnips may thus be produced as from 20 bushels of bone-dust applied in the ordinary way cannot be too widely known. Of course we do not pledge ourselves to it that this result will in all cases be experienced, but from the evidence we have already published on the subject, it appears that it may in ordinary circumstances be reasonably expected.

Before directing the attention of our readers more particularly to this subject, we may just state, in continuation of our remarks on the use of bone-dust as a manure 30 or 40 years ago, that farmers then appeared to differ as much as they do now about the most suitable form in which it should be applied. There were those then who advocated the use of fresh bones; some thought they should be boiled, and others again would burn them. Though the conversion of the insoluble phosphate of lime, which is probably the *most* valuable ingredient of bones, into the soluble superphosphate by means of sulphuric acid is certainly the most interesting question connected with our present subject; yet we may just give the following table in illustration of the question of burnt *versus* unburnt bones. It is extracted by Mr. Hannam's permission, and in fact at his suggestion, from the truly valuable report of his experiments on manure, which was published in a late No. of the "Highland Society's Transactions." The crop on which the experiments in these cases were made was Turnips.

	Crop per Acre. Nothing. tns.	cwt.	Crushed Bones. tns.	cwt.	Burnt Bones. tns.	cwt.
Land manured evenly at the rate of 6 loads per acre, and bone-dust on certain parts, at 2 qrs. per acre	16	2	19	2	18	5
Land unmanured, except with bone-dust on certain parts, at 2 qrs. per acre	16	1	24	6	25	17
Land manured evenly at the rate of 6 loads per acre, and bone-dust on certain parts, at 2 qrs. per acre	15	15	20	3	18	11
Land unmanured, except with bone-dust on certain parts, at 2 qrs. per acre	7	0	15	3	9	0

With one exception these results are quite what any one would expect from a consideration of the composition of bones. It is impossible, from what we know of the value of animal manures, to suppose that the grease or jelly which exists in fresh bones possesses no fertilising influence. By its decomposition it yields ammonia, which is well-known to be a powerful manure, and all the advantage of this is lost by those who burn bones before applying them to the land.

We have but little new evidence to adduce on the value of sulphuric acid and bones as a manure. The experiments of the Duke of Richmond, of Mr. M'William and Dr. Manson of the Moray Farmers' Club; of Mr. Lawes of St. Alban's; and Mr. Purchas, of Chepstow, may be found detailed in previous Numbers of this *Gazette*; and they are quite conclusive. We add some of Mr. Hannam's, extracted from the "Highland Society's Transactions":—

Turnips per Acre. *Manure.*	Crop. Tons.	Cwt.
Bone-dust, crushed, 2 qrs.	15	3
Do. burnt, 2 qrs.	9	0
Bones, 1 qr., and 12 stones of sulphuric acid	13	7
Bones (burnt), 1 qr., and 6 stones of sulphuric acid	17	7
Farm manure, 15 loads	22	10
Guano, 2½ cwt.	22	0
Nothing	7	0

This agrees pretty well with what has been already published on the subject, in pointing out bones treated in this way to be a cheap and valuable manure for Turnips, and we hope that it will be tried very extensively this year.

For the information of several who have applied to us on the subject, we extract from Mr. Purchas's report to the Monmouth Farmers' Club, the following directions for manufacturing the superphosphate of lime:—

"*For one acre.*—Place a tub that will hold at least 60 gallons near the water intended to be used, put into the tub 3½ bushels (28 gallons) of fine bone dust, then put 80 lbs. (about 4 gallons) of sulphuric acid (oil of vitriol) to the bones, adding 24 gallons of water, total about 56 gallons; mix the whole by stirring, which do two or three times in the first twelve hours, and before using it the mixture is to be left for twenty-four hours. Care should be taken not to mix more acid and bones in the tub than will be used each day, for about one-fifteenth part evaporates the first twenty-four hours. A water-cart holding 200 gallons was nearly filled with water, then about 14 gallons of the mixture out of the tub was put into it, the cart filled up with water and the whole well stirred. The quantity put upon an acre was four cart loads, or 800 gallons. The Duke of Richmond put upon an acre only 400 gallons of water and 2 bushels of bones. His grace's trial was *most successful*."

And we republish Mr. Lawes's directions on the same subject; they appear to be suitable more especially for those who do not wish to apply the manure in solution.

"Calcined bones reduced by grinding to a very fine powder, are to be placed in an iron pan with an equal weight of water (a cast-iron trough, such as are sold for holding water for cattle, will do); a man with a spade must mix the bone with the water until every portion is wet: while the man is stirring an assistant empties at once into the pan sulphuric acid, 60 parts by weight to every 100 parts of bone; the acid is poured in at once, and not in a thin stream, as commonly recommended; the stirring is continued for about three minutes, and the material is then thrown out. With four common farm-labourers and two pans, I have mixed two tons in one day, the larger the heap that is made the more perfect the decomposition, as the heap remains intensely hot for a long time. It is necessary to spread the superphosphate out to the air for a few days, that it may become dry. The great mechanical difficulty of reducing unburnt bones to a very fine powder renders the formation of superphosphate of lime from them very difficult, but common bone-dust in a pure state (that which is sold often contains one-third of lime) may be decomposed by boiling it in a leaden pan with half its weight of sulphuric acid and twice its weight of water, which may afterwards be dried up with sawdust or clay-ashes."

ON BLACK HORSEPONDS.—No. IV.

IT is generally believed that the value of all crops chiefly depends on the amount of animal nourishment which they contain,—in the shape of gluten in cereal crops, in that of legumen in leguminous crops, and of vegetable albumen in root-crops. Now, these ingredients differ in composition from those making up the bulk of the vegetable, inasmuch as they contain nitrogen as one of their elements, while the latter, viz. starch, gum, and sugar, do not. These (the starch, gum, &c.) being composed of carbon and water, are evidently intended to supply carbon to the lungs, where, by a singular process of animal combustion going on through the instrumentality of respiration, they are consumed as the means of keeping up the animal heat. This, then, is the use of starch, gum, &c., to the animal economy. But to the formation of muscle, flesh, and blood, nitrogen is indispensable. There can be no doubt, therefore, that the vegetable principles of gluten, &c., are the only flesh-forming principles, in fact, the true substantial nourishment of the animal; and it should, therefore, be the object of every practical man to increase these principles in his crops by every means in his power. This can only be accomplished by the use of such manures as are capable of yielding ammonia; and on the greater or less abundance with which it is supplied to the crops, within certain limits, will depend their nutritive properties. Hence, we find a marked increase of the gluten in Wheat to follow the use of such manures as are capable of yielding ammonia by their decomposition, as flesh, blood, and urine; or those manures which contain the salts of ammonia ready formed in them, as guano. But of all the fertilisers within the reach of the farmer, capable of yielding ammonia, the urea of the urine is the most valuable; and if, as Liebig states, "with every pound of urine a pound of Wheat might be produced, and with every pound of ammonia which evaporates a loss of 60 pounds of Corn is sustained," what must be the number of bushels of Wheat annually lost by the farmer who allows the thousands of pounds of urine voided by his cattle and horses to undergo spontaneous decomposition, without an effort to avail himself of its benefits, or to fix the ammonia generated by the decomposition of the urea it contains? But plants not only require nitrogen for their sustenance, to assist in the formation of gluten and vegetable albumen, they also require a certain quantity of several inorganic substances, without which no plant can perfect its seed; these are potash, soda, lime, magnesia, sulphuric acid, phosphoric acid, and chlorine. Now, these substances are precisely those which are found in the solid matter contained in the urine of cattle, and in such a state as is best adapted to be taken into the texture of plants, and appropriated as food. Of this matter thousands of tons are annually allowed to run to waste as if it were not only useless, but a positive injury to the land; while the farmer goes, "cash in hand," to purchase guano to apply to his crops, the very essence of which he daily wastes with the most perfect indifference; yet, every ton of which is at least equal in fertilising effect, and, consequently, also in money value, to the ton of guano purchased at 10*l.*, and for which he often pays much more, owing to the impurities which it so frequently contains.

To place this part of the subject in a clearer light, and show the practical man that these inorganic substances, which he allows to find their way into his horsepond, are really of value to plants, are found in their texture, and in fact essential to their growth, I will take the amount of inorganic substances contained in the crops, removed in a four year rotation, of Turnips (bulbs only), Barley, Clover and Rye-grass, and Wheat, as given by Professor Johnston. Let the crop of Turnips amount to 25 tons of roots per acre; of Barley, 38 bushels; of Clover and Rye-grass, of each one ton of hay; and of Wheat, 25 bushels. Then we have from the entire rotation in pounds:—

—	Turnip Roots.	Barley. Grain.	Barley. Straw	Red Clover.	Rye Grass.	Wheat. Grain	Wheat. Straw	Total.
Potash	145.5	5.6	4.5	45.0	28 5	3.3	0.6	233.0
Soda	64.3	5.8	1.1	12.0	9.0	3.5	0 9	96.6
Lime	45.8	2.1	12.9	63.0	16.5	1.5	7.2	149.0
Magnesia	15 5	3.6	1.8	7.5	2.0	1.5	1.0	32.9
Alumina	2.2	0.5	3.4	0.3	0.8	0.4	2.7	10.3
Silica	23.6	23.6	90.0	8.0	illegible	illegible	illegible	illegible
Sulphuric acid	49.0	illegible	illegible	illegible	illegible	illegible	illegible	illegible
Phosphoric acid	illegible	illegible	illegible	illegible	illegible	illegible	illegible	illegible
Chlorine	14.5	illegible	illegible	illegible	illegible	illegible	illegible	illegible

* County Reports for Derbyshire and Hertfordshire.

Now, if we compare the quantities of these different ingredients with the same ingredients capable of being yielded to the plant by 100,000 lbs. of ox urine, or 7376 lbs., the dry matter contained in the above quantity of urine, we shall find that the potash contained in it is more than sufficient to supply the wants of all the plants grown during three entire rotations; that the soda contained in it is equal to the demand made by the crops, for more than five years; that the magnesia is more than sufficient to supply the plants for four years, or one rotation. The sulphuric and phosphoric acids are more than equal to supply the necessary quantity for a period of five years, while the chlorine would supply the crops at least ten years.

Thus we find that the urine of the ox contains all the inorganic constituents required by plants, and that in considerable quantities; and although guano is richer in phosphoric acid, and possibly in the elements of ammonia, it is nearly destitute of the salts of potash and soda, two very necessary constituents in the food of plants. Hence we may infer, that the solid matter in urine is at least equal to guano as a fertilising agent. But as a proof of my former statement, that urine, if properly prepared by fixing the ammonia, will produce most decided effects on the crops, I need only insert the following experiments, made with the dry solid matter obtained from urine, by first fixing the ammonia:—

Crop.	Quantity applied	Produce per acre. Undressed.	Dressed.
		Tons. Cwt.	Tons. Cwt.
Turnips.	1 cwt. per acre.	12 17	24 11
Potatoes.	1½ „ „	12 18*	14 10
Wheat.		43 3bushels	51 18bushels
Oats.	100 lbs. „	44 —	54 2

These results are sufficient proof of the advantages to be derived from the use of urine, and certainly ought to stimulate to exertion those farmers who expend money in the purchase of guano, while they witness with the most perfect indifference the waste of a fertilising liquid, capable of producing all the effects of guano, at a fiftieth part the cost of that article; and with which liquid they produce disease, and often suffer the death of many a valuable animal, by compelling it to drink a poisonous solution of its own excrements from its owner's black horsepond.—*Alfred Gyde, Painswick.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

As the method of fixing or striking the fiars prices of grain adopted in this county presents certain peculiarities, as compared with that pursued in other parts of Scotland, a brief account of it may not be here out of place, in connexion with the subject of tenure occupying my two last papers. The authority for the continuance of this peculiarity is immemorial usage, sanctioned by a special judgment of the Court of Session, applicable to the mode of striking the fiars, and bearing date 10th Dec., 1771.

The fiars are generally declared upon the first Thursday of March annually, and the averages ascertained are those of grain of a particular crop or year, sold between the reaping thereof and the second last Friday in Feb. thereafter. On a few occasions, the fiars have been ascertained, and struck a week earlier.

In the beginning of February, annually, a list of from 80 to 100 of the principal farmers in the county, who sell grain within the same for ready money, is prepared; care being taken to select a proper proportion from each district. These are then summoned to appear before the sheriff on the last Friday of February, being market-day in Haddington, there to depose to the quantities, kinds, and prices of grain sold by them respectively of the last-reaped crop, and requiring them to lodge with the proper officer on the previous Friday a note of such sales, including those of that day, under a penalty of 10*s*. Each return from these notes of sales is copied over in the form of a deposition, and upon the day of appearance, the sheriff administers an oath to each seller appearing, to the effect that the note of sales there read over to him is true—that the grain sold was by imperial measure—all raised within the county—of the particular crop for which the fiars are about to be ascertained—and all delivered within the county at the prices stated. From the evidence in these depositions, statements are prepared by the sheriff clerk, showing the particular quantities or number of quarters sold by each person at each price—the total quantities sold at each price, as shown by the returns—the amount or value of each total quantity sold at one price—the gross amount of the quantities sold, and the gross price thereof.

From the data thus given, the average prices are easily ascertained by dividing the gross price by the number of quarters, the result being the price of one quarter. This produces the general medium, to which an addition of 2½ per cent. thereon is made to form the average or second fiars for the particular grain under calculation. The reason assigned for this addition to the average prices is, that it was long the custom to strike the fiars twice in the year, at the terms of Candlemas and Lammas; but that the average of both fiars was found to be, during a considerable number of years, nearly the same as that struck at Candlemas, with the addition of 2½ per cent. upon the amount. The tenants some time ago, having strongly expressed their dissatisfaction with this method of striking the fiars, had the matter legally investigated, but failed to effect any alteration, as the existing mode had previously received the sanction of the Supreme Court.

* The land on which the potatoes were planted received a dressing of 40 cubic yards of dung per acre.

The fiars of each kind of grain are divided into three classes, in the following manner:—The general medium price, exclusive of the addition of 2½ per cent., being ascertained, the gross value of the grain sold above that price is divided by the total number of quarters also sold above it, and the result, with the addition of 2½ per cent., forms the first or highest fiars. The general medium, as ascertained in the manner already stated, with the addition of 2½ per cent., forms the second or medium fiars. The gross value of the grain sold below the general medium is divided by the total number of quarters also sold below it, and the result, with the addition of 2½ per cent., forms the third or lowest fiars.

As before observed, all the grain in the returns must be the growth of the county, but it will be apparent that only a portion of that sold within the county is included in striking the averages. All grain sold upon credit or for seed, all gray corn, and that not delivered within the county, is excluded; and further, all sold in markets out of the county is also excluded. No fiars of meal, flour, or other articles are struck.

The notes of sales, depositions, and calculations in striking the averages, are preserved by the sheriff-clerk, and a separate record is kept, showing the several fiars prices for each year. This latter record exists from 1627. After the fiars are declared in court, upon the first Thursday in March, extracts are issued by the officer to those requiring them.

The following are the East Lothian fiars, per imperial quarter, for the crops of 1842 and 1843:—

Crop 1842.	First.	Second.	Third.
Wheat	£2 12 0½	£2 8 11	£2 5 8½
Barley	1 10 5½	1 8 3½	1 5 11½
Oats	1 1 7½	0 19 11½	0 18 3½
Peas	1 9 9½	1 7 8½	1 5 6
Crop 1843.	**First.**	**Second.**	**Third.**
Wheat	£2 14 5½	£2 11 3½	£2 8 8½
Barley	1 13 11	1 11 10½	1 9 10
Oats	1 2 1½	1 1 0½	0 19 11½
Peas	No return.	No return.	No return.

In most of the other counties of Scotland the fiars prices are ascertained by a jury of respectable tenants and proprietors. A large number, usually 45, are summoned by the sheriff at the Candlemas term, and a jury of 15 balloted from among them. The fiars are then struck by the jury in the manner already described, with the exception, however, of any per centage being added, as is the case in East Lothian. The ministers' stipends are usually computed by the first or highest fiars, and the rents generally by the second or medium fiars; but this is matter of agreement between the parties.—*T. Sullivan.*

ON THE MANUFACTURE OF PEAT-CHARCOAL.

In reply to your inquiries relative to the methods of charring Peat, &c., alluded to by me at a recent meeting of the Council of the Royal Agricultural Society of England, you are welcome to such knowledge as I possess.

The clamps which I constructed in Lancashire were small, being about 2 yards square within, and the walls about 1½ yard high. These were rapidly and conveniently built of massive sods cut from the superficial bog-earth, which had been recently turned over by a peculiar plough, in slices 18 inches broad by 9 inches deep. The joints of the walls were plastered, where needed, with soft stuff obtained from adjacent drains. I also formed other clamps or kilns, both square and circular, by raising walls with moist bog diggings, on the plan of Pisa work. Since the purport of all ovens is to keep air out, and heat in, it is obvious that any material will serve a temporary purpose which may be handy to the desired spot, cheaply put together, and which does not burn away too quickly. Slabs of unburnt clay would answer well, but my object was to use the materials furnished by the bog itself, and in any part of it. Three or four small holes, say 4 inches square, are left in the walls at bottom to give air for kindling the fire, which is first made pretty strong with dried Peats, in order to establish a mass of red-hot fuel at bottom. These apertures are diminished as the process goes on, and finally stopped up. If the Peat to be charred be nearly dry, the clamp may be speedily filled, always using the driest Peat first, and covering the top with damp sods or diggings. The air-holes must be quite closed when it is judged, by the appearance of the volume and clearness of the smoke, that sufficient heat is acquired below to carry on the operation. As the contents subside fresh stuff is added, care being taken to maintain the kiln quite full, to close all interstices in the walls, and to fill up holes at top as they occur from shrinkage produced by combustion. Flame must never be allowed to appear on the surface. The clamp is known to be sufficiently filled with charcoal when the added stuff settles but little. The operation should be stopped when the charred mass approaches within 18 or 12 inches of the top; otherwise, the incumbent air, particularly in windy weather, may reach the charcoal, which would then be quickly reduced to ashes. The fire will gradually go out on carefully stopping the access of air, and smothering the surface with wet stuff, but the best plan is to extinguish with water, which also prevents the finer dust from being blown away when the clamp is emptied. These are the chief observances to be regarded in the management of such kilns, but there is some skill requisite in giving air, from time to time, at bottom, if the operation proceed too sluggishly, &c., which must be left to the intelligence of the attendant, and which a little practice would soon point out to him. One man can attend to many such ovens, when the stuff to be charred is close at hand; or, if one kiln only be used, it must be looked to twice or thrice in the day time, and be particularly well fed at night. In boisterous weather it is well to protect the windward side with wattles, or some such simple contrivance, especially at the top of the kiln; and in very rainy weather a wattle or reed roof might be useful; but I have known the operation to proceed very well—though of course more slowly—when a clamp was unprotected in the middle of a wild bog, and under heavy snows.

I mentioned that clay might be advantageously roasted in the same clamps with Peat. In my experiments on this earth, in conjunction with Peat, I employed it both in the friable state in which it is found after clearing out ditches, and also in its natural compact state, working the latter into small balls and partially drying them. Clay acts usefully by detaining heat within the kiln, and it is itself torrified by the process. In localities where clay is found contiguous to Peat, the combination of the two substances in the same kiln would be little expensive; but this must be received rather as a suggestion for others to work upon, than as the result of sufficient experience on my part.

As regards the charring of farm weeds, it may not be always convenient to remove them from a field; and it must be recollected that weeds when dried and burned in heaps serve as fuel to roast or burn some of the soil. In cases where this process is desirable and found to be beneficial, it will probably be considered as the best and most economical method of getting rid of weeds, and of converting them to use, as it is done on the spot; but weeds from plantations, the thinnings of fences, small brushwood, the clearings of ditches, &c., (perhaps even leaves) might, I think, be turned to better account than they commonly are, by charring them in clamps, mixed or not with clay, according to the uses for which they are destined. I also conceive that the produce from field weeds would form a still more efficacious manure if they were better dried, covered more thickly with earth, and burned in much larger heaps than is usual, so as to render the combustion very slow, which would reduce more of the vegetable matter to the state of charcoal, and less of it to ash.

There is another species of temporary kiln much used in France, where vast quantities of peat charcoal are prepared and used instead of wood charcoal, for cookery, &c. I have also seen the same somewhere in England or Ireland, but forget he locality. Where bogs are cut away for the purpose of fuel, and that work is judiciously performed by quarrying the bog with a perpendicular face from top to bottom, and by bringing on the floor, or original soil, flat and available for immediate culture, a cheap and excellent charcoal kiln is formed by sinking a cylindric hole (conical towards the bottom like a lime-kiln) in the firmest part of the peat, and within a yard or two of the face of the cutting. A small hole is then pierced through the face into the kiln at the level of the bottom, to draw off any water at first, and to let in as much air as may be necessary when the kiln is at work. These kilns will serve many times in bogs of tolerably firm consistency, if skilfully managed. The sides become charred and hard, and charcoal being a very slow conductor, heat penetrates but a short distance into the surrounding mass, though the hole is of course enlarged each time of use.

If the preparation of peat charcoal for manure were to become an object of such importance and sale, that extreme economy in the cost of its production were of moment, other and very superior methods of kilning it could be pointed out, as practised at Mennecy, Elbœuf, and other parts of France; also at Liverpool, and in Ireland by C. W. Williams, Esq., Director of the City of Dublin Steam Company. I have limited my observations to the construction and management of that species of rough and ready agricultural kiln which is most likely to suit the individual farmer; but where any one possesses a peat to which he might annually resort for his supply of charcoal, it would be more advisable to build an oven of brick, than of the perishable materials above mentioned. Even ashes would be much better prepared and secured in a walled kiln, than as ordinarily exposed to the winds of heaven.—*Josiah Parkes, 7, Great College Street, Westminster.*

ON MINERAL AND INORGANIC MANURES.

No. XVII.

By PROFESSOR CHARLES SPRENGEL.

(*Continued from page* 303.)

e. Marl from Oldenburg (clayey). 100,000 parts consist of

76,383	parts	silica and quartz sand
5,902	„	alumina
5,696	„	oxide and protoxide of iron
0,240	„	oxide of manganese
4,499	„	lime
1,100	„	magnesia
3,339	„	carbonic acid, combined with lime and magnesia
2,556	„	sulphuric acid, combined with lime as gypsum
0,250	„	phosphoric acid, combined with lime
0,015	„	common salt
0,020	„	potash, combined with silica

100,000 parts.

This marl is chiefly used for bringing heath-soil into a state of cultivation, which it will improve not only chemically, but mechanically; so much so that Peas, Rape, Rye, and other crops may be raised at once, whilst the same soil manured merely with dung, will only produce Rye, Oats, and Buck-Wheat. This marl, it is true, contains but little potash and soda, but this is of little con-

sequence, as heathy soils contain originally not only much silicate of potash, but also silicate of soda. And then such soils can be also manured with heath-ashes, &c., by which they will also obtain much potash and soda. For a heath-soil, however, which is rich in coal of humus, the lime and magnesia of the marl are always the most important, as generally there is plenty of gypsum, phosphoric salts and common salts in the soil. This is confirmed by the analysis of the next following marl, which is much used in Osnabrück, for the bringing into cultivation and the improving of heath-soils, and is, in fact, nothing else but a sort of lime tuffa.

f. Marl from Osnabrück (granular). 100,000 parts yielded

6,680	parts	silica and quartz sand
0,312	,,	alumina
0,416	,,	oxide of iron
0,880	,,	oxide of manganese
0,030	,,	potash united with silica
0,016	,,	sulphuric acid combined with lime into gypsum
90,541	,,	carbonate of lime
1,092	,,	carbonate of magnesia
0,033	,,	common salt
100,000	parts.	

Of this marl (like that marked *a*) no more than 100 cubic feet are required for the Magdeburg acre, and this will produce a powerful effect for the space of eight or nine years. On heathy soils it will act so powerfully that the farmers convey it (like *a*) from a distance of two to three German miles on their fields. It, however, exhausts the soil very soon, if it be not also manured with dung; and this exhaustion will take place the sooner, the less there is of coal of humus. The above marl is found on the slope of a range of calcareous hills, where it is constantly formed, being, as stated before, nothing but lime tuffa. Used on the spot, it is of no use to the soil. I have found the same to be the case in other places, where a similar marl, or rather lime tuffa, did not produce any effect, the soil containing always enough of lime, whilst there was but a very small quantity in it of coal of humus, gypsum, phosphate of lime, and other important mineral substances, which are required for the nourishment of plants. These not being supplied to the soil by the marl, it could not produce any effect.

g. Marl from Brunswick (loamy). 100,000 parts consist of

73,423	parts	silica and quartz sand
1,880	,,	alumina
3,160	,,	oxide and protoxide of iron
0,272	,,	oxide of manganese
0,750	,,	potash united with silica
0,090	,,	soda ditto
0,120	,,	gypsum
0,710	,,	phosphate of lime
0,012	,,	common salt
1,520	,,	carbonate of magnesia
18,055	,,	carbonate of lime
100,000	parts.	

This marl is a very good manure for both heath and sandy soils. It has not been yet sufficiently long in use for knowing from actual experiment how many years small quantities will act; but this may be ascertained by calculation. Its manuring qualities, as far as gypsum, soda and potash are concerned, cannot go a long way, as it posesses so very little of them. Its contents of common salt are not worth speaking of. It will act best on heath soils, as it will find there a great amount of coal of humus for decomposition. The sandy soils, on which it has been hitherto used, contain, according to my analysis, very little lime or magnesia, somewhat more coal of humus, phosphate of iron, silicate of potash, silicate of soda, and common salt; so that, when the action of the marl has ceased, it will merely require to be manured with gypsum, in order again to become productive, as then the plants will again find all mineral substances in the soil, which they require for their nourishment. As it is, however, chiefly from dung that plants obtain nitrogen, this sort of manure also is not to be neglected.

AGRICULTURAL EXPERIMENTS.

I ALMOST scruple to send you an account of the experiments which I made last year, as to the action of the artificial manures upon root crops, on account of my conviction that they were tried in quantities too small to insure accuracy in the averages on a more extended scale. I mean, the quantities of produce that were weighed; for the influence of accidental circumstances is too much multiplied in calculating the quantity per acre. The anomalous results which have been obtained, at least in the case of Turnips, are the best proof of this fact; the produce of four perches was weighed, and the average computed from these data, together with the expense per acre of each manure, is shown in the following Table:—

	tons	cwt.	lbs.	£	s.	d.
3 cwt. of guano, and 10 bushels of ashes	8	17	76	1	19	9
6 cwt. of urate, and 10 bushels of ashes	9	5	20	1	13	9
12 bushels of Poittevins, No. 36, and 24 bushels of ashes	9	11	68	1	9	3
10 bushels of Poittevin's, No. 170, and 20 bushels of ashes	9	1	68	2	5	0
18 bushels of Clarke's compost, and 36 bushels of ashes	9	13	44	2	6	6
20 bushels of wood-ashes	9	7	70	2	7	6
Without any manure	9	12	36	0	0	0
Total expense of manures on 6 acres	0	0	0	10	1	9

Is it necessary, then, to conclude that the whole of this 10*l.* 1*s.* 9*d.* has been thrown away, besides a diminution of produce, amounting, on the whole, almost to 2 tons? I think not; for, in the first place, accident may have occasioned a local difference in the growth of the plants which similar experiments on other portions of the same ground would have served to correct; or the unmanured part might chance to be of a better quality, or to have received more manure in the preceding year than the rest; or the various insects which attack the Turnip crop may have been more active in one part of the field than another; in the next place, a portion, at least, of the value of the manures may remain in the soil, to promote the fertility of succeeding crops; lastly, the fault may have been not at all in the manures themselves, but in the misapplication of them; it may be not a defect but an excess of power, for if the plants were forced into full maturity too soon, the texture of their roots would begin to decay before the season arrived when they were wanted for use. An instance of this occurred in some other experiments with the same sort of Turnip (the red Tankard) in another field; two of the same manures were used, and in the same proportions as before, with very little variation of produce:—

	Ton.	cwt.	lbs.
6 cwt. of urate, and 10 bushels of ashes, gave	9	6	68
20 bushels of ashes	9	17	16
But the same quantities applied to other Turnips in the same field, which were sown a month earlier, gave only	6	7	36
and	6	16	108

The roots grew well, and looked well, but the process of decomposition had begun before they were taken up in the autumn, and they had become light and soft. But when applied to Swedes, which are of a much firmer texture, and less liable to decay, the same quantity of one of the same manures was found to be more than equivalent to ten loads of farm-yard dung.

	Ton.	cwt.	lbs.
The latter produced	12	15	80
The urate and ashes produced	13	3	104
In the same field 20 bushels of bone-dust produced	13	12	26

In two other fields two of the salts most beneficial to Wheat were not found to answer at all either with Swedes or with Dale's Hybrids.

	Ton.	cwt.	lbs.
Without extra manure the weight of Swedes was	13	19	32
With 1 cwt. of sulphate of ammonia	12	13	104
With 1 cwt. of nitrate of soda	11	1	88
On Dale's Hybrids—			
Without manure the weight was	10	7	16
With 1 cwt. of sulphate of ammonia at 17*s.*	10	7	96
With 1 cwt. of nitrate of soda at 1*l.*	10	6	8
But manured with farmyard drainings it was less, being only	10	0	81

This shows that whatever might be the cause of failure in the other cases, it is not necessary to attribute it to any want of fertilising power in the salts, since the liquid manure, containing nearly all the principlse of fertility, failed still more. The uncertainty of these trials was exemplified in two other instances: where 1½ cwt. of guano, 10 bushels of bone-dust, and 5 of wood ashes were applied, the produce weighed 17 tons 14 cwt. 72 lbs.; which seemed to be a considerable increase above another equal portion sown broadcast, without manure, the weight of which was 15 tons 1 cwt. 8 lbs.; but on another portion of the same field where the seed was drilled, and no manure given, the apparent advantage was materially reduced, for the weight was 17 tons 1 cwt. 48 lbs.: the difference in this case would not repay the cost, which was 1*l.* 18*s.* 7*d.*

In two trials, which were made with a view to compare the value of the old Swede with that of Skirving's in the ordinary course of husbandry, the first was unfavourable to Skirving's, the weight being less by 1 ton 4 cwt. 58 lb.; but on a second trial it was more by 2 tons 16 cwt. 8 lb.; the difference, therefore, on the whole, being in favour of Skirving's, to the amount of 1 ton 11 cwt. 68 lb. per acre; but though the bulk of produce was greater, it is material to remark that they were not so firm in their texture, and were less able to resist the frosts of winter. One more experiment was made with these roots, the results of which were equally unsatisfactory.

	Ton	cwt	lbs
2½ cwt. of sugar-scum, with 1½ of guano, gave	15	0	86
2½ cwt. of sugar-scum, with 1 cwt. of sulphate of ammonia	16	16	0
And without manure	16	1	31

Thus, in the first case, with an expense of 1*l.* 1*s.* 2*d.*, the produce was less, and in the second the increase was not enough to pay the expense,—1*l.* 0*s.* 2*d.* But in order to do justice to the sugar-scum, I will now take it first in detailing another series of experiments made on Mangold Wurzel. The produce of the manured portions were in every instance compared with the produce of unmanured portions in adjoining rows, and I shall designate the increase or decrease of weight by the algebraic signs, plus + and minus —.

Sort of root.	Quantity of manure.	Wt. of prod. Ton	cwt	lbs	Difference Ton	cwt	lbs
1. Red globe	4 cwt. of sugar-scum	9	10	16	+ 1	14	64
2. Long red	4 ,,	12	16	16	,, 1	17	80
3. ,,	4 do. + 90 lbs. of Sulphate of ammonia	12	6	80	,, 1	17	80
4. ,,	4 do. + 1½ cwt. of guano	11	4	80	,, 0	15	80
5. Red Globe	4 do. + do of guano	6	13	64	— 4	4	96

The failure in the last case cannot fairly be attributed to the manure, for the same quantities in the preceding instance produced an increase of weight, small indeed, but more than sufficient to repay the cost, which was 17*s.* 6*d.* The sulphate of ammonia seems to have been utterly useless, and to have produced no effect at all, if it can be taken for granted that the soil was the same, which, though both were in the same field, is not certain, and that no accidents had affected the one part more than the other; but setting aside the last experiment, which from some local peculiarity is inadmissible, the evidence upon the whole tends to show that sugar-scum may be employed with benefit to this crop, and it is no small recommendation that the risk in using it is no more than 5*s.* per acre; it is remarkable that precisely the same loss was incurred from some accidental cause, in one out of these seven trials with guano:—

Sort of root.	Quantity of manure.	Wt. of prod. ton	cwt	lb	Difference ton	cwt	lb
1. Long red	1½ cwt. + bushel of ashes	12	16	16	+ 0	6	32
2. ,,	2½ ,,	16	8	48	,, 0	12	64
3. Yel. globe	2½ ,,	19	1	96	,, 1	11	46
4. Red globe	2½ ,, + 2½ ,, of charcoal	20	0	80	,, 1	10	48
5. Long yellow	2½ ,, ,, 2½ ,, ,,	17	15	64	,, 1	14	64
6. Long red	2½ ,, ,, 2½ ,, ,,	17	16	48	,, 1	5	16
7. Yel. globe	2½ ,, ,, 2½ ,, ,,	13	15	0	— 4	4	96

In this case it so happened that while the manured row produced less than usual, the unmanured produced more; and when we look at the issue of the other trials, it is probable that both were the effect of accident; but when this accidental difference of 27 lbs. in the scale on which the trial was made, becomes multiplied by 350 in computing the average, it is evident that a very erroneous view of the action of the manure must be the necessary consequence; the same objection might be urged against any other single experiment that tells the other way. But the argument in favour of the manure relies upon the number of experiments which show its effects to be so far good, that in general no loss is sustained by using it, if there is not much profit. From four experiments made with bone-dust, it would seem that this manure is far more beneficial to this crop:—

Sort of root.	Quantity of manure.	Wt. of prod. ton	cwt	lb	Difference ton	cwt	lb
1. Red globe	2 cwt. of bone-dust	17	7	32	— 0	9	48
2. Long yellow	2 ,, ,,	14	1	32	+ 1	2	0
3. Long red	2 ,, ,,	17	16	80	,, 3	9	16
4. Yellow globe	2 ,, ,,	18	3	0	,, 5	3	80

The mean, then, of the differences in favour of bone-dust, is 3 tons 4 cwt. 106 lbs. against which is to be set the loss of 9 cwt. 48 lbs.; but this is evidently the effect of some accidental richness in the soil of the unmanured row which was made the subject of comparison, for the absolute produce falls very little short of that which exceeded, by 3 tons, the produce of the adjoining unbone-dusted row; on the other hand, in another part of the same field, the application of the same quantities of the same manures four times repeated, gave a difference upon the whole, of 23 tons 11 cwt. 48 lbs. in favour of the guano and charcoal.

	tons	cwt.	lbs.
For 4 portions manured with 2½ cwt. of guano and do. of charcoal, gave	102	12	32
For 4 manured with 2 cwt. of bone-dust, produced	79	0	96

The first was more expensive, but not at all in proportion to the increase of produce; it cost 34*s.* 8*d.* per acre—the bone-dust only 7*s.* 6*d.* I have only to add upon the subject of these roots, that the Globe varieties seemed to be much superior to the long; a cartload of the former weighing about a hundred weight more than a cartload of the latter. Poittevin's manure was tried, but its action was so irregular, that it is useless to record the results; so also in its application to Potatoes; in one case it failed, in another it succeeded. The subjoined table will show its effects upon this crop, together with those of three other manures:—

Quantity of Manure.	Cost per acre. £	s.	d.	Produce per acre. tons	cwt.	lbs.	Difference. tons	cwt.	lbs.
1. 2 cwt. of Poittevin's No. 36	0	6	9	10	8	0	— 0	17	65
2. 2 cwt. of Do., No. 170	0	15	0	10	17	66	+ 1	12	0
3. 2 cwt. of Clarke's desic. compost	0	7	5	10	17	66	,, 0	12	90
4. 2 cwt. of nitrate of soda	2	0	0	11	13	55	,, 1	8	65
5. 3 cwt. of guano	1	16	0	12	6	43	,, 2	8	0

These are but contributions towards a more perfect knowledge of the effects of artificial manures upon Potatoes; for it has been already shown that little reliance can be placed upon solitary experiments made on a small scale: in this case the quantities actually weighed were the produce of 10 yards of a row. The last series of experiments which I have to mention was with white Carrots; and, making a similar allowance for possible errors from the same cause, the results appear to be highly satisfactory. Out of 14 trials there is but one failure, and these, the produce of 11 yards without manure, weighed only half a pound less than that of 11 yards manured with nitrate of soda; the respective quantities being 40 and 40½ lbs. computed by the acre, the statement stands thus:—

Quantity of Manure.	Cost per acre. £	s.	d.	Produce per acre. tons	cwt.	lbs.	Difference. tons	cwt.	lbs.
1. 1 cwt. of nitrate of soda	1	0	0	11	12	82	— 0	2	102
2. 21 galls. of Poittevin's, 36	0	4	5	11	18	62	+ 0	2	102
3. 7 cwt. of bone-dust	1	6	3	12	4	62	,, 1	9	102
4. 1 cwt. of sulphate of am.	0	17	0	11	12	82	,, 1	9	10
5. 2½ cwt. of guano	1	10	0	11	1	11	,, 1	9	10
6. Farmyard dung	0	12	0	14	8	0	,, 1	9	10
7. 21 galls. of Poittevin's 170	0	9	10	12	18	102	,, 1	14	102
8. 21 galls. of Clarke's desic. compost	0	4	10	13	13	52	,, 2	6	61
9. 3 cwt. of guano	1	16	0	12	13	10	,, 3	4	0
10. 1 cwt. of oxygen alkali	1	8	0	13	10	61	,, 3	9	92
11. 1½ cwt. of guano	0	18	0	15	14	22	,, 4	16	3
12. 1 cwt. of am. alkali	2	2	0	11	6	103	,, 5	4	82
13. 6 cwt. of guano	3	12	0	14	10	103	,, 5	7	73
14. 3 cwt. of urate	0	15	0	17	3	32	,, 6	6	52

It is remarkable that there are only three instances in which the absolute produce ranges higher than with farmyard dung at a cost of 12*s.*, and that 6 cwt. of guano, costing 3*l.* more, only exceeds it by about three cwt.; and yet relatively, that is to say, compared with the adjoining unmanured portion, it stands only ninth in value. It is also worthy of notice that in the 11th experiment the absolute produce of 1½ cwt. of guano exceeds that from four times the amount of the same manure, by more than a ton, and though the comparative value is less, yet when the expense of each is deducted, the smaller weight of excess gives a much larger profit. The total increase of weight upon 13 acres, after deducting the small loss in the first experiment, and excluding from the calculation the farmyard dung, is 36 tons 6 cwt. 27 lbs., the expense 16*l.* 3*s.* 2*d.* Upon the whole, therefore, it is reasonable

to infer from the evidence of these experiments, that there is no root-crop to which the artificial manures can be more profitably applied than white Carrots, and that they will more than repay the additional cost by increased bulk of produce; but experiments are still wanting to determine which is the most suitable, and what proportions should be used.—*L. Vernon Harcourt.*

Home Correspondence.

Frauds on Farmers.—There is an article vending at this time in Hull, under the name of "*bone ashes, perfectly genuine*," and finding a ready sale for the Turnip crop, which I have examined, and which certainly does not contain so much as 5 *per cent.* of *real* bone ash! It appears to consist almost entirely of CRUSHED LIMESTONE!! This is a case precisely analogous to that mentioned by Mr. Solly, and reported and commented upon in the *Chronicle* a few weeks since.—Alas for the farmers who happen to get hold of this rubbish! Pray lose no time in warning your very numerous circle of readers against what I must denominate a shameful attempt at fraud, and one that I should certainly have fallen a victim to, had it not been for the assistance of a little chemical knowledge.—*W. P.*

Wooden Shoes.—I remember reading once in an old collection of fables about a town that was either besieged or about to be besieged by an enemy, when a consultation was held to devise means how the inhabitants might best defend themselves against the attacks of their foes. The mason said that nothing was equal to stone and lime; the carpenter declared that timber was far better; while the shoemaker thought that there was nothing so good as leather. Now, in the fortifications of the lower parts of what honest John Bunyan would call the town of Mansoul, your correspondent, "Martin Doyle," recommends timber. Whatever sort of materials should compose the rampart, bastions, ravelins, demilune, vamps, souterrains, &c., and how they should be defended, I will leave it for others to decide; but this I will say, from experience in the matter, that in defending the lower part of the citadel from the dismounting batteries of rheumatism, or the ricochetting batteries of cough, or the breaching batteries of consumption, there is nothing like leather. I have examined many varieties of feet-defenders, from the ditching clog to the satin slipper, Highland brogues and Isle of Man sandals; neither have I confined my examination to the boots and shoes of our own country, but have examined the flag shoe of Russia, the wooden shoes of France and Flanders, the snow shoes of North America, the ornamental cloth-boots of the American Indians, the bone-heeled slippers of Affghanistan, the leopard-skin shoes of Hindostan, the turned-up points of China, &c. I have had, perhaps, as much pleasure in studying the anatomy of an old shoe, as Knight had in the study of vegetable physiology, or Cuvier in organic remains. No doubt the different pursuits are not for one moment to be put in the balance with each other, but a poor man is sometimes obliged to turn his attention to subjects which a rich man would not deign to look at. Upwards of four years ago I purchased a pair of shoes for seven shillings: after using them twelve months at "kirk and market" I turned them into a pair of common working shoes, and they are still my working shoes, and are on my feet at the time I am writing this notice of them; and how long we may remain together, I know not, but if no particular change happen, it may be for years yet. I have made a calculation of the number of miles we have travelled together, and find the average to be about a thousand miles a year, besides the fatigue they have undergone in peat holes, digging, trenching, hedging, &c. I have kept them in repair myself ever since I received them from the shoemaker, and find that it costs one shilling and sixpence a-year to keep them in repair. They afford me a double comfort, namely, that of wearing old shoes, which are commonly easy for the feet, and of being seldom in the shoemaker's shop. Now this is, I think, something better than "Martin Doyle's" wooden shoes, both for comfort and cheapness. About ten or twelve years ago clogs were introduced into the part of the country where I reside, and were for a time in a fair way for supplanting leather shoes. They were recommended by medical men. But the clog mania has now disappeared, and they are scarcely seen except with a few ditchers and dyers; and it is very probable that wooden shoes would share the same fate, unless persons were trained from infancy to use them. When a working man has a wife and family, it is a great saving to him when he can keep their shoes in repair;—the children are more comfortable. The money that is saved in drugs and poultices is sometimes not a little; and good shoes often keep the doctor from knowing the road to the house. It gives me great pleasure to see my wife and family well shod, and I have never yet, nor ever will, I hope, look upon them as an incumbrance, as many advertisers, disciples of Malthus, I suspect, appear to do.—*A Working Man.*

Rooks.—Your correspondent "S." p. 171, states—"It is singular how long men will argue about matters which facts only can decide, and when the facts of the question about rooks might be so easily ascertained, by examining the crops of these birds. It appears to me that it will not be found so easy a matter to ascertain the real quantity of corn that there is in the crop of the crow, because it will require the contents to be analysed before the answer can be proved clearly to the question, What is the quantity of meal from corn, and what is the quantity of other matter from the worms and grubs, in the crop of the crow? My attention was directed to the following interesting fact some years ago, by a Rev. gentleman, who had a large rookery near to the Rectory-house, and who pointed out to me the husks of corn lying upon the ground in lumps, which had been discharged from the mouths of the crows from the top of the trees:—the corn undergoes this operation in the mouth of the crow; the crow performs a similar work to man, in preparing the corn for his food, so that only the real meal passes into the crop of the crow. If any of your readers will examine any rookery in their neighbourhood, where corn is much cultivated, I have no doubt that they will find the husks of the corn as above stated; there is no doubt but the crow destroys a large quantity of grain in seed-time. Though we have now abundance of rooks, they appear not to destroy the Turnip-fly, which is well known as a destructive insect to the farmer. In p. 268, I stated that four acres of Swede Turnips were destroyed by the fly; now, this field was the second field from a rookery, and I consider this to be a proof that rooks are not advantageous to the farmer. I have inclosed the husks of the corn as discharged from the mouth of the rook.—*Facile.* [Certainly, the specimen received from our correspondent is a very interesting and complete proof of the fact, that rooks do feed to a considerable extent on seed—Oats, Barley, &c., at this time of the year.]

Wheat grown on a hard plain surface without Soil, the Seed being covered with Straw.—This has been done on a pane of glass, the decomposition of the straw, (with the exception, of course, of rain, atmosphere, &c.) being its only source of nutriment. This discovery, developed in France three years ago, as reported in a newspaper paragraph of that date, was believed at the time to have been of such importance that a new era was supposed to have arrived in Agriculture; that henceforth there would be no need of tillage, or any artificial stimulants to the soil—nothing would be required but hard smoothly-rolled land, and the covering of straw for the seeds. How is it that we have heard nothing more of this?—*J. R. L.* [We remember the paragraph very well; and the natural inference to be drawn from the subsequent silence which has prevailed on the subject of it is doubtless the true one. The experiment, which was, we think, performed by a member of some Belgian Agricultural Society, gave results, if we may believe the report, which must certainly be interesting to those who delight in testing the great powers which Nature often puts forth on an emergency; but the idea that it could be of the smallest use to Agriculture is utterly absurd.]

Ammonia.—In one of your Leading Articles of last Saturday's *Chronicle*, an account is given of some experiments upon the growth of Turnips with manure in different states, and in one of these, where the ammonia was driven off by the addition of caustic lime before using it, the produce appears to be quite as favourable as where the whole of the ammonia was retained. In the conclusions you draw from these results, you state "that after all that has been said about the importance of ammonia in manures, the crops are as good where that principle is driven off as where it is retained by fixing." This appears to me, hasty and inconclusive, as applied to crops in general; for although in the present case the absence of ammonia is not felt, still, I think, we have no right to suppose that its absence would not be felt by other crops, as it appears from Drs. Daubeny and Playfair's tables of the constituent parts of different vegetables, given in Dr. Smith's paper, published in the *Chronicle* of the 20th April, that Turnips only contain about 1 per cent. albumen, and consequently require little or no nitrogen for their nourishment; such, however, would not be the case with the cereal or leguminous tribes, as Wheat, Barley, and Oats, or Peas and Beans, which, according to the same authorities, contain from 12 to 30 per cent. nitrogen, and would, therefore, require a considerable supply of some substance like ammonia, rich in nitrogen.—*An Original Subscriber.*

Prickly Comfrey.—In answer to the inquiry of a "Subscriber," in a former Number of your Paper—I have always found Symphytum asperrimum (the Prickly Comfrey), as well in a calcareous loam as in a clayey bog-soil, to be abundantly prolific of seed; but from the peculiar habit of the plant, it is a difficult task to collect the seeds. The very numerous flowers grow on a long curved spike, and not more than two or three of them are taken at one time. Those blossoms which open first form and ripen their seed (which drops out of the capsule nearly as soon as it is ripe) long before the flowers on the extremity of the spike have opened; so that there can be no general harvesting of the seed; but, on the contrary, if you cut off the spike even at the most favourable time, you will get only one or two ripe seeds, perhaps none, with several dry and withered capsules from which the seeds have fallen, and many buds quite tender and unformed. But if you have the patience to examine the spikes separately and frequently, you may gather from each of the numerous branches one or two ripe seeds at very short intervals of time, and so collect a considerable quantity of seed in the course of the season; or if you cause the ground for a yard round each plant to be dug up and broken fine, and to be raked over towards the end of autumn, you will have in the succeeding spring an abundant spontaneous growth of seedlings from the fallen seeds. But the seedling plants do not yield a produce much worth cutting before the third year; wherefore the experiment of the value of the plant may be more quickly proved by making a plantation of the cut roots of old plants. Both Symphytum officinale, and Symphytum echinatum, which last has been recommended by a most skilful and well-informed experimental farmer, Mons. Vilmorisi, 30, Quai de la Megisseni, Paris, as superior in merit to S. asperrimum, throw up their flower-stems earlier in the year than S. asperrimum. Whether S. echinatum is palatable to cattle, I have as yet had no experience; but cattle never leave S. officinale uncropped in the meadows where it grows, and I have found horses and pigs to eat S. asperrimum with great readiness. I have never tried cows with it. Of the productive powers of S. echinatum, I cannot as yet speak, my plants being only seedlings of 1843, but it appears to promise a considerable bulk;—*W. P., Taunton.*

Scutch.—I beg to inform you that scutch is the refuse of the glue coppers, and consists of fatty matter, with lime and hair. It contains some fertilising properties when used in compost heaps and decomposed, but it is used in very large quantities by the *cheap* sellers of ground bones, who offer at lower prices than any respectable dealer can grind them for.—*Mark Fothergill.*

Yew.—I think it was Mr. Compton who stated such startling facts about the Yew killing some horses when eaten green, two or three Papers ago. I hope your readers will give their experience upon this much-disputed point. I have not the least doubt Mr. Compton states what is a fact; but it seems so completely to oppose what I have always observed, that it quite puzzles me. As soon as I read his note on the subject, I took a friend to the Yews I mentioned about a month since, and there showed him a thick shrubby Yew, some 5 ft. or 6ft. high, with a wall of 3 ft. high between it and the field in which cattle are kept. This tree is browsed quite close, and even as far as cattle can reach it over the wall. It is so at all seasons, by any cattle or horses that may happen to be in the field; and moreover, the stock and sheep have very frequently access to the churchyard in which this and four other shrubby yews grow, constantly eat them, and never have suffered in the least. I write this, hoping that some of your readers will be able to throw light upon this puzzle.—*W. D. F.* [Since this has been in type we have received another letter on the subject from our correspondent, who informs us that at Kingley Bottom, near Chichester, there is a valley full of old Yews. Perhaps some of our readers in that neighbourhood may be able to throw light on a question, the true answer to which will have to reconcile such apparently very contradictory evidence.]

Diseases of Poultry.—I beg to send you an extract on this subject from the lately published work, "Farming for Ladies," which I can recommend to poultry fanciers:—"The common remedy for the pip or gape is to peel off the membrane with the nails, and afterwards rub the tongue with butter and honey. Upon dissection after death, however, there have been found in the windpipe several small red worms, varying in size: they can be removed with safety and facility in the following manner:—Let the operator take a small but firm feather from a hen or pigeon, and strip it from the stem, excepting about an inch and a half from the tip end, according to the size of the chicken, wetting it a little, except at the extreme point." This is to be placed in the mouth of the chicken, and as soon as it breathes, to be introduced into the windpipe and pushed gently down and turned round, "by which means some of the worms will adhere to the feather, and others will be so loosened that the chicken will sneeze them up and throw them from its mouth."—*M.S.*

Bone-dust.—There is now much said about reducing bones as manure by acids, so that the whole of them may be fit for immediate use, as is not otherwise the case. It has occurred to me that they might be reduced at much less expense by means of large Papin's digesters, and much more expeditiously. If this was suggested to the public by means of your Paper, perhaps some person would be induced to make the experiment on a large scale. I have been making trials of various manures on my Grass-plots. I marked out with pegs a great many divisions, each containing 1½ superficial yards. Upon each division I placed 3 oz. in a state of solution in water. The nitrates of soda and potash have produced more Grass than any other manure. I collect in a tank the dirty waters from my house, and water my Grass ground with it.

The effect this produced was	3d
Muriate of ammonia	4th
Guano	5th
A mixture of the whole (3 oz.)	6th
Carbonate of ammonia	7th
Black water from a dunghill	8th
Common salt	9th
Sulphate of magnesia	10th

Very little or no effect was produced from 3 oz. of each of the following salts, on 1½ yard of Grass land:—

Superphosphate of lime	Muriate of lime
Carbonate of soda	Phosphate of magnesia—(this is the best among this last list)
Sulphate of lime	Dissolved soap
Dissolved bones in sulphuric acid, and another lot in muriatic	Sulphate of soda

The soil on which these experiments were made is a poor gravel. Perhaps several of the salts which did not answer on my land might do so elsewhere.—*C. A. A. Lloyd.*

Stall-feeding Cows.—Surely "X." must have made some mistake in his statement "that after a time all these animals are found to have tubercles on the lungs." If any system of feeding would prevent tubercles on the lungs, it is this, if judiciously practised. The stable they are kept in must be well ventilated and clean, their food properly diversified and in proper quantity; they must be warm in winter, and cool in summer; and if thus kept I think all who, like myself, have any experience in stall-feeding, will say the dairy-cows are far more healthy than those who run in the fields in all weathers; that they give quite as much or more milk, and that richer; that they are in much better condition; and finally, that the economy in food, and the gain in good manure, both

iquid and solid, is very great indeed. As a proof that stall-feeding does not in all instances generate disease, I can only say, that for the last five years I have seldom had less than from 12 to 20 of all ages up at a time; that I have never had any disease of the lungs in any one instance, when the animal has been kept up; though round me whole dairies have been swept away by the deadly disease in that organ, which has raged this year. I used to lose more when they were in the fields than since I have kept them up, and the same ground will keep above double—I should say treble the number. I ought to have added, that I always let them have two or three hours to rub themselves and walk about in a small yard, and they go to water about 100 yards twice a day. For rearing cattle for dairy management, or for feeding, I feel sure "X." will find it much the best system if he tries it fairly.—*W. D. F.*

New Cause of Failure in the Wheat Crop.—There has been a remarkable failure of some fields of Wheat around North Berwick, which has been ploughed down within the last few weeks. In early spring it promised as fine a crop as any in the country. Plants, however, here and there began to look sickly and to flag, which lay w the e! in the course of ten days. On examination every stem of the plants attacked were found to contain a small grub, which enters about two inches beneath the surface of the soil, eats its way up the centre of the stem till it reaches the light, when it either dies or becomes transformed. The plants appear to reproduce fresh buds from the joint beneath the door of the grub; but the remaining vitality seems too weak to carry leaves to the air for respiration, far less to yield a crop. Mr. Ross, steward to T. Richardson, Esq., Abbey Mains, called lately with specimens of the plants containing the grubs, which we showed to Professor Low and others, who looked upon them as new evils on the farmers of this country. It, however, shows the importance of Entomology to the agriculturist, as perhaps the most efficient preventive for such would be to detect the insect fly when it appears to deposit its eggs, and keep it from lighting on the field by the application of some repulsive perfume, such as soot, guano, or sand that has been immersed in gas-water, &c., dried and sown over the field. Might not entomologists find it a profitable employment to get up small cabinets of insects injurious to vegetation, in their various transformations, with details of the best known preventives and remedies for the destruction of each species?—*R. Arthur, Edinburgh.*

Indian Corn.—In reference to Mr. Colman's remark upon Indian Corn being well worthy of a trial as green food for cows (see page 306), I feel convinced that this plant might be grown with much advantage for this purpose, even in the north of England, and much more in the south. Last year I grew about a score of plants of seed I brought from the north of Italy, which, from Mr. Colman's description of "the Canadian variety with small yellow ears," I should think were the same kind. These yielded so much excellent food for cows late in September, and they were so fond of it, eating Cob half ripe, leaves and stalk, with the greatest relish; but I have this year sown all the seed I had (two cobs), and am only waiting for rain to transplant it. I should be very glad to induce others to try it in the south, and state the result in the autumn. It comes in for cow food at a time when Vetches are finished, when Clover is much better eaten by sheep than cut again, and when it is wasteful to give Turnips, as they are fast increasing in bulk and goodness.—*W. D. F.*

Manures.—As it appears from Mr. Gyde's calculations in the last *Agricultural Gazette*, p. 222, amply borne out by those of Liebig and Mr. Bree, that the annual urine of each individual contains 67 lbs. of solid matter, equal as to its manuring properties to guano, it follows that its yearly value at the price of the latter (10*l.* per ton) is full 5*s.*, and consequently that, if the urine of the 2,000,000 of inhabitants of London were collected and applied as manure, its annual value would be 500,000*l.*, equal to ten per cent. on a capital of 5,000,000*l.*—a sum amply sufficient to pay for the outlay necessary to have a separate system of drainage-pipes for the metropolis. Why, then, with our superfluity of capital, is not a company organised for this purpose? What folly to send, at vast expense, for guano from Peru and Africa, when we can have at home as good manure for less money; for if the other contents of water-closets be included, the product would be in value far more than 5*s.* per head. Even in the little Italian state of Lucca, the farmers (who rarely occupy more than from 10 to 20 acres of land each) readily give a sum equal to 1*l.* a-year for the contents of the cesspool of a family, and fetch it in large water-carts from Pisa—a distance of 15 miles; and as manure is at least twice as dear here, it follows that the annual value of the contents of the water-closets, &c., of the 5,000,000 of families of the United Kingdom is 10,000,000*l.* sterling, of which full half, or 5,000,000*l.*, is wasted—equal in value to 500,000 tons of guano, of which manure we are actually fretting about the possibility of exhausting the supply, when we voluntarily waste an amount of manure at home equal to 1000 cargoes, of 500 tons each, of it annually! And if to this we add only half of Mr. Gyde's estimated amount of the manure from cattle (30,000,000*l.*) as being wasted, we have 20,000,000*l.* every year thrown away—a sum as large as we could possibly gain even if our exports of manufactures were trebled, and increased from 50,000,000*l.*—their present amount—to 150,000,000*l.*; for every one knows that 20,000,000*l.* on an export of 100,000,000*l.* would be a large profit.—*S.*

Horse Chesnuts.—A traveller writes in the *Elysée* as follows:—"Whilst I was at Geneva, in the autumn of 1837, I observed every one collecting carefully the fruit of the Horse Chesnut; and upon inquiry, I learnt that the butchers and holders of grazings bought it readily at a certain price per bushel. I inquired of my butcher, who himself held an extensive grazing farm, what was the object of this, and he told me that it was given to those sheep, particularly, that were fattening. The Horse Chesnuts were well crushed, something in the way, as I understood, that Apples are, previous to cider being made. They are crushed or cut up in a machine in Switzerland, kept solely for that purpose, and about two pounds weight is given to each sheep morning and evening. Sheep eat it greedily; but it must be portioned out to them, as too much would disagree with them—it being of a very heating nature. The butcher told me that it gave an excellent flavour to the meat—and the Geneva mutton is noticed for being as high flavoured as any in England or Wales." Now, we know that sheep eat the Horse Chesnut even when not crushed; but many thousand tons of it are annually lost in this country, from their having no access to it, or its being uncrushed. Many other fruits and leaves also, doubtless, might be found useful, were they carefully examined, and their properties ascertained. While we are constantly amusing ourselves in crossing Tulips and Roses, it is surprising our horticulturists have never thought of improving the properties of useful plants, many of which might certainly be exceedingly improved. Sheep, for example, like herbs, &c., that are heating in their qualities; as is seen even in the case of the Horse Chesnut. Could the qualities of the Turnip or the Ruta Baga, and the Radish, be in any degree combined, sheep would doubtless prefer this compound to either of the simple plants; and as these are the days of improvement, and the Horse Chesnut is abundant this year, some inquiries and experiments should, in the proper season, be instituted.—*An Upland Farmer.*

Plantations.—In this country the forester and the farmer ought to go hand in hand; for, owing to the nature of the climate, the first process is to secure shelter by raising healthy plantations, which can only be done by thinning and pruning; and this is easily attainable by industry and perseverance. Perhaps the principal cause of the mean appearance of many plantations and hedge-row timber is to be attributed to the want of due care having been taken with them in their young and growing state; and, indeed, though the soil be of the very best quality, we often find these plantations very improperly laid down, in the manner of distributing the trees in their respective situations. A question naturally arises, What can be the cause of thousands of trees in plantations being wasted in the heart; they being what might with propriety be termed trees in the vigour of their growth, considering their age? The trees of this age ought, in ordinary circumstances, to be in the strength of their growth; and a person acquainted with the growth of timber may, at first sight, have a competent knowledge of the progress they have made in past years. Is it possible that trees thirty or forty years old, averaging 20 or 30 feet in height and 6 or 8 in diameter, and standing only 3 or 4 feet apart, and without the aid of the pruning-knife, can be in a healthy, growing state? Every gardener is aware, and the ordinary laws of Nature will teach the most obtuse observer, that any plant, to be allowed to reach to its natural size, requires a space of ground corresponding to the size it naturally attains under ordinary circumstances; in short, if any plant has not sufficient space, corresponding to its natural vigour of growth, premature old age must overtake it at an early stage of its existence. The general error of planters evidently is, the want of thinning and pruning at all stages of their growth; and all this arises from the mistaken idea that woods will not grow in an exposed situation, unless thickly drawn up together. No doubt the plan may do for a time, but where is the value of the wood thus managed in the end? We often see a good healthy tree standing the storm, unsheltered and alone, in the coldest part of the country; and why should it not, if properly managed, that is, carefully pruned, do so equally well, standing at a convenient distance from neighbours? We see everywhere bare and waste lands growing fair crops of Oats while exposed to sweeping winds; what would it not do if sheltered by woods? I need not answer the question, as it is evident to every one; and it may be anticipated that such will yet be the state of matters in every part of the country. The advantages arising from shelter are—the arresting the progress of impetuous and dangerous winds, maintaining the temperature of the air, regulating the seasons, lessening intense cold, opposing the formation and increase of ice, moderating intense heats, dispersing hail, snow, and watery clouds, and preserving the soil on mountains, by which their external figure is maintained. The profits of planting are great when properly executed, and this idea adds solidity to the enjoyment. Pleasure alone may satiate; but profit and pleasure united seldom fail of producing a lasting gratification. Strength is gained as effectually by a few branches, to form a head, as by many. However much attention be paid to the article of pruning, if the plantation be left too thick, it will be inevitably ruined. A circulation of air, neither too great nor too small, is essential to the welfare of the whole. This should not be wanting at any period of the growth of the plantation; but in cases where it has been prevented by neglect, it should not be admitted all at once or suddenly. Opening a plantation too much at once is a sure way to destroy its health and vigour. Though it has been more or less fashionable for the last 40 or 50 years to form plantations, yet it has been also so generally the custom to neglect entirely their future culture, that by far the greater proportion of the surface covered with trees in Britain may be considered as neglected or mismanaged. The artificial strips and masses have generally never been thinned or pruned; and the natural woods and copse-woods improperly thinned or cut over.—*An Upland Farmer.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY Council was held at the Society's House in Hanover-square, on Wednesday last, the 29th of May; present, the Right Hon. Earl Spencer, President, in the chair; Duke of Richmond; Marquis of Downshire; Earl of Hillsborough; Lord Portman; Hon. R. H. Clive, M.P.; R. Archbold, Esq., M.P.; J. Baines, Esq.; D. Barclay, Esq., M.P.; J. Raymond Barker, Esq.; F. Burke, Esq.; Rev. T. Cator, Col. Challoner; F. C. Cherry, Esq.; E. D. Davenport, Esq.; B. Gibbs, Esq.; T. B. Glegg, Esq.; H. T. Grant, Esq.; E. Holland, Esq.; G. Jacson, Esq.; Sir C. Lemon, Bart., M.P.; Rev. T. Lewis; Col. Macdouall; John Mott, Esq.; J. W. Lennox Naper, Esq.; J. Newell, Esq.; T. Newman; Jos. Parkes, Esq., C.E; E. W. W. Pendarves, Esq., M.P.; W. J. Pickin, Esq.; E. S. Chandos Pole, Esq.; H. Price, Esq.; P. Pusey, Esq., M.P.; Prof. Sewell; W. Shaw, Esq.; R. A. Slaney, Esq.; Rev. T. Slapp; J. Manners Sutton, Esq.; T. Tweed, Esq.; Dr. Ure; J. L. White, Esq.; G. Wilbraham, Esq., M.P.; and H. Wilson, Esq. The Right Hon. Lord Beaumont, of Carleton-hall, near Selby, Yorkshire; Col. Jas. Macdouall, 2d Life Guards; and John Boyd, Esq., of the Borough of Southwark, were elected Governors, and the following gentlemen Members of the Society:—

Mackintosh, James, West Stratton, Winchester
Cousmaker, Launay, Westwood, Farnham, Surrey
Gower, Andrew W., Hook, near Hartford-bridge, Hants
Morison, John Alexander, M.D., Portclew, near Pembroke
Little, R. D., Secretary to the Agrl. Soc., Chippenham
Fry, Robert, Tockington, Thornbury, Gloucester
Vivian, George, Claverton Manor, Bath
Hunter, Henry Lannoy, Beech-hill, Reading
Trew, Thomas, Southampton
Aldridge, James, Throop-farm, Christchurch, Hants
Parmiter, Samuel, High-street, Southampton
Rendall, George, Quarr-farm, Ryde, Isle of Wight
Roddam, William, Roddam, Wooller, Northumberland
Leeke, Ralph, Longford-hall, Newport, Salop
Charlton, Philip, Withyford Hall, Shrewsbury
Fennor, J, Vernham, Andover, Hants
Webb, William, Lee, Southampton
Græme, W., Winchester
Boldero, H., Woolton House, Bedford
Wroughton, Philip, Ibstone House, Stokenchurch, Oxon

The names of 38 candidates for election at the next meeting were then read.

The reception and discussion of the numerous communications laid before the meeting having taken place, the Council adjourned to Wednesday next, the 5th of June.

Reviews.

A Prize Essay on Manure. By George Thompson, Jun. Simpkin, Marshall, and Co.

THE prize offered by the Stewponey Agricultural Society in 1843 was awarded to this essay, by the Royal Agricultural Society of England. In extracting from this pamphlet the following Tables, giving the results of experiments with manures, though they appear to contain valuable evidence on the subject of manures, we must express our entire dissatisfaction with the opening paragraph; the tendency of the opinion which it advocates is most injurious. Let farmers hold a high opinion of farm-yard manure; it will keep them from carelessly wasting it. We do not wish a higher value to be placed upon it than really belongs to it; but certainly the circumstance, stated by Mr. Thompson, that the farmer gets a decent profit on his fattening animals independently of the manure which they make for him, is no argument for putting its value below its usual standard. But this is far from being always the case; in some districts of Lincolnshire, where large quantities of oil-cake are used in feeding sheep and oxen, we are informed that if three-fourths only of the purchase-money of this food be repaid by the increased quantity of beef and mutton produced by its consumption, then the farmer is satisfied; for he knows that the superior quality of the manure produced fully repays the remainder of the purchase-money, with a suitable profit on the whole of it. It is highly important that farm-yard manure should be understood to be what it is—the very sheet-anchor of Agriculture, and that any carelessness in manufacturing or preserving it is a source of great loss to the farmer.

"In preparing the subjoined reports of experiments, (*which have, through the kindness of those who instituted them, come under the immediate inspection and observation of the author,*) a lower price is placed upon farm-yard manure than has been customary. Every money charge made in the following reports, is made at the rate of cost to a farmer. Farm-yard manure has been generally valued at six shillings per ton, but extensive inquiries amongst practical agriculturists convince us that this is too high.

All good managers will, in the average of years, gain a profit upon their live stock, consequently, the manure they make actually costs them nothing. If the converse be true, and the reports of those experiments be correct, which are said to have been instituted by farmers, and which show guano to surpass Farm-yard manure at six shillings per ton, why do not those farmers dispose of their live stock entirely and purchase guano, or other artificial manures? Is not this a proof that farm-yard is cheaper than any artificial manure? But it is indis-

putable, that by good management, the farmer gets a decent profit upon those animals which make his farm-yard manure, hence it costs him little or nothing; and the Author is, therefore, justified in placing it as low as *two shillings per ton*; being the estimated incidental expenses attending it.

The costs of the carriage of manures, in the following reports, are also placed at the *actual amount* incurred by the farmer, and not, as is too common, at the usual rate of hire.

Miscellaneous.

The *Adelaide Observer* contains the following, under the head of "A New Road to Wealth:"—"It has been found out that by boiling down sheep, both ewes and wethers, from 25 lbs. to 30 lbs. of tallow can be obtained from each sheep; which, at the moderate calculation of 3½*d.* a-pound, will yield from 7*s.* 3½*d.* to 8*s.* 9*d.*, or upwards of a hundred per cent. more than has been realised of late years for the living animal. But adding to this the value of the wool, skin, mutton, hams, &c., the sum total will not be less than 14*s.* 3½*d.* per sheep. 'If this result be too flattering,' says the *Sydney Herald* of the 24th June, 'let the odd 4*s.* 3½*d.* be taken off, and even then it is demonstrated that, in the very depth of winter, when the fleece is in the worst possible state, the intrinsic value of a sheep is 10*s.*; and even deducting a round 20 per cent. from this, we have still the cheering minimum of 8*s.* Contrasted with the nominal value which sheep bore a month ago, this is an advance at once most extraordinary and exhilarating!' It is estimated that there are 4,000,000 of sheep in New South Wales, which yield a surplus stock annually of 1,000,000; and supposing the number which are slaughtered and die to be nearly 600,000, the settlers will be able, without diminishing the number kept in the colony, to boil down 400,000 sheep; which will yield them for exportation every year, at a moderate computation, 6,000,000 lbs. of tallow and 400,000 sheep-skins,—the tallow being reckoned at 100,000*l.*, and the skins at 30,000*l.*, besides mutton-hams! A correspondent of the *Australasian Chronicle*, who had examined some of the tallow produced by boiling down sheep, thus reports upon its quality—'The tallow produced from the kidneys is much superior to any Russia white-candle tallow I ever saw, and would, I doubt not, realise in the London market 4*s.* per cwt. more. The second quality is a good clean article, but would perhaps not realise within 2*s.* or 3*s.* per cwt. of Russian yellow-candle tallow.' We must give the caution which our Sydney contemporary gives to his constituents—'Use the golden opportunity of bettering your circumstances which has so miraculously turned up—use it thankfully—use it promptly—but use it advisedly and with moderation. A sheep shorn may live to be shorn again, but a sheep boiled is gone for ever.'"

Risk attendant on the Possession of different Animals at various Ages.—Losses by fatal accident are different, according, not only to the different species of cattle, but to different ages, as the following Table shows:—

LOSS ACCORDING TO PER CENTAGE OF VALUE.

	Horses.	Kine.	Sheep.	Swine.
From birth till weaning	5	3	10	12
— weaning till 1 year old	4	2	8	6
— 1 to 2 years	3	2	7	3
— 2 to 3 years	3	1.5	5	3
During time of use	5	2	5	4

—*Burger's Economy of Farming.*

Notices to Correspondents.

BOOKS.—*T. L. Y.*—We do not know one work on sheep *and* cattle. On the former subject, see Mr. Spooner's lately published work, Blacklock's Treatise, &c. On the latter, see the work published by the Society for the Diffusion of Useful Knowledge.—*J. B.*—Swinborne's "Farmer's Complete Account Book," printed in Colchester.

CHARCOAL.—*J. H. Darton.*—It is useful in fixing the ammonia and removing the smell of cloacine; it may also be usefully applied by throwing it in a powdered state into the urine tank, and afterwards applying it on the land, as a manure for Turnips.

DRAINING.—*W. C.*—You may certainly, by digging into the clay, increase the efficiency of your drains, and diminish the necessity for having them so near one another; but we think 30 inches is deep enough—it is much more expensive to take out the last 6 inches of depth, than it is to remove the first 6 inches.

DRESSING FOR TURNIPS.—*X. Z.*—Bones and sulphuric acid (see this day's Leading Article). About Hops, probably next week.

FIXING AMMONIA.—*A Subscriber.*—Lime will drive it off. Fresh charcoal-powder mixed with the night-soil, or sulphuric acid, will fix it.

GRASS.—*Jim.*—The specimen you send is not in flower, and therefore cannot be named. It looks like Festuca cæsia. Please to explain what you mean by "an unsound bottom." No method short of breaking up the pasture will be effectual in destroying the prevailing Grasses in it. If your land wants lime, and the sea-sand you speak of is calcareous, its application will be beneficial.

HUMIC EARTH.—*P.*—Vegetable mould generally contains a considerable quantity of free humic acid.

LUCERNE.—*Banks of the Deane.*—It should have been sown in the middle of April. Good farm-yard manure, at the rate of 30 yards per acre, well incorporated with the soil, is as useful a tillage as any, for this, as well as other crops. 3 cwt. of guano, and 2 cwt. of gypsum, per acre, mixed, spread broad-cast and harrowed in a week before sowing, would probably answer your purpose.

MANURES.—*P. Drill.*—Use a tin scoop, and sow the guano and ashes broad-cast by hand; harrow it well in, and afterwards ridge up for Turnips. The best way, perhaps, of applying the sulphuric acid and bones is in solution, before sowing, by means of a water-cart. (See Mr. Purchas's directions, in this day's Leading Article.) The difference between fresh and old wood ashes is, in the former containing a portion of caustic alkali, which will volatilise any ammonia it may meet with, while in the latter this causticity has been neutralised by the union of the alkali with the carbonic acid of the air. We should doubt the usefulness of applying the solution of nitrate of soda in the way you propose.

NAMES OF PLANTS.—*Jack o' Kent.*—Your plant is Colchicum autumnale, or Meadow Saffron—a virulent poison, quite capable of producing all the mischief among cattle which you describe. We do not know what can be added to the information already given about guano, but will consider.

ROOT CROPS.—*T. P.*—"Fresh-raised clay" will not interfere with the action of the manure, but it is very likely to interfere with your efforts to bring your land to a sufficiently fine tilth for root-crops. We are unable to answer, the same week that we receive them, letters which reach the office after Wednesday.

THE PIP OR GAPES.—*Poultry Fancier.*—See "Home Correspondence."

VICTORIA WHEAT.—*A. G.*—We do not know it.

WOOD ASHES.—*T. M.*—The idea that these will drive off ammonia from guano, when mixed with it, depends for its accuracy upon the presence in them of caustic alkali; you will find that in recommending their admixture with guano we have named always *old* wood-ashes, as in them, after a long exposure to the carbonic acid of the air, there is less likelihood of the presence of any *free* alkali. Perhaps, though a more expensive, it may be a safer way to supply the deficiency of alkali in guano by adding carbonate of soda. We should be sorry to consign the doctrines of the advantage to plants of ammoniacal manures, or of humus either, to the "tomb of the Capulets."

ERRATA.—In the notice by *W. C. S.*, at p. 348, the following errors occur:—for "potassia, tartrate of antimony," read "potassio-tartrate of antimony;" and for "put a seton in the poll and in the loins; if there is paralysis or weakness give broths," &c.—read "put a seton in the poll and in the loins if there is paralysis or weakness. Give broths," &c. And in Mr. Sullivan's paper on East Lothian Husbandry, at p. 343, it is said that 60 acres of arable land are there termed a ploughgate; it should have been 60 *Scotch* acres.

*** As usual, many communications have been received too late.

Markets.

MARK-LANE, MONDAY, May 27.

THERE was a moderate arrival of English Wheat from the near counties this morning, but the trade ruled heavy for all descriptions, particularly secondary qualities, which must be written 1*s.* per qr. cheaper.—Of new Baltic a large quantity is offering, duty paid, from the vessels, for which as well as old foreign, there is only a limited demand, and last week's prices are with difficulty supported.—English Barley is unaltered in value; of foreign but a small proportion is offered for sale, and must be quoted 1*s.* higher than this day se'nnight.—Beans and Peas are fully 1*s.* per qr. dearer.—Oats sell freely, and all but the very finest being an advance of 6*d.* to 1*s.* per qr.

BRITISH, PER IMPERIAL QUARTER.				s.	s.

FRIDAY, May 31.

There is little English Wheat fresh up for this morning's Market, and its value is unaltered; of foreign only a small proportion of the arrivals is offered for sale, for which Monday's quotations are maintained, as well as for old qualities, but business is limited.—During the week a few sales of Rostock Wheat have been made at 36*s.* per qr. f. o. b. freight included, and new Dantzig has brought 38*s.* f. o. b.—We observe that since the Act for Bonding, free flour and biscuit came into operation, 70,000 qrs. have been released under it.—Barley, Beans and Peas fully support their late prices, and meet an occasional inquiry f. o. b.—The quantity of Oats on sale is small, and they meet a quick sale on fully as good terms as of late.

Supply short, and trade brisk.

COVENT GARDEN, JUNE 1.—Notwithstanding the changeable state of the weather during the week, the Market has been well supplied; but trade has been rather dull. Little alteration has taken place in the prices of Fruit since our last report. Pine Apples, although not very plentiful, are sufficient for the demand. Grapes are becoming more abundant. Some good Peaches and Nectarines are in the market, and there has also been supplied a few fine specimens of Cantaloupe and Green-flesh Melons. Cherries are considerably reduced in price; they are getting more plentiful. Apples and Pears are scarce. Gooseberries are abundant and cheap. Oranges are not plentiful. Among Vegetables, Cauliflowers have been well supplied during the week, and they are improving in quality. Carrots and Turnips are not good, owing to the long dry weather. Rhubarb is sufficient for the demand. Asparagus is slightly reduced in price. French Beans are good, but not abundant. Strawberries consist of Myatt's British Queen and Keen's Seedling—the former is large and fine; a few from the open ground have also been brought to the market during the week, which were sold about 2*s.* 6*d.* a pint. Peas are abundant. Lettuces and other salading are plentiful. The best Cucumbers are offered at about 1*s.* each. Cut Flowers consist of Erica hybrida, E. ventricosa coccinea minor, E. vestita alba, Boronia denticulata, Eutaxia myrtifolia, Honeysuckles, Pelargoniums, Fuchsias, Lily of the Valley, Verbenas, Pansies, Calceolarias, Moss, Provence, and China Roses.

FRUITS.

Pine Apple, per lb.,	6*s* to 12*s*	Gooseberries, per hf.-sieve,	2*s* to 3*s*
Grapes, Spanish, per lb.,	1*s* to 1*s* 6*d*	Lemons, per dozen,	1*s* to 2*s*
Hothouse Grapes, per lb.,	4*s* to 10*s*	— per 100,	6*s* to 16*s*
Melons, each,	5*s* to 12*s*	Almonds, per peck,	6*s* to 7*s*
Peaches, per dozen,	20*s* to 30*s*	Sweet Almonds, per lb,	2*s* 6*d* to 3*s*
Cherries, per lb.,	3*s* to 10*s*	Nuts, Spanish, per bushel,	18*s*
Apples, Desert, per bushel,	10*s* to 25*s*	— Brazil,	16*s*
— Kitchen, per bushel,	3*s* to 14*s*	— Barcelona,	20*s* to 24*s*
Currants, per half-sieve,	4*s*	— Cob,	14*s*
Strawberries, per oz,	6*d* to 1*s*	— Hazel,	3*s* to 4*s*
Oranges, per dozen,	1*s* to 2*s* 6*d*	Walnuts, per bush., shelled,	16*s* to 20*s*
— per 100,	6*s* to 18*s*	Chesnuts, per peck,	4*s* to 6*s*

VEGETABLES.

Rhubarb, per bundle,	4*d* to 1*s*	Cucumbers, each,	4*d* to 1*s*
Cabbages, per dozen,	6*d* to 1*s* 6*d*	Spinach, per sieve,	9*d* to 1*s* 6*d*
— Red, per dozen,	2*s* to 3*s*	Leeks, per doz. bun.,	9*d* to 1*s*
Sorrel, per hf.-sieve,	6*d* to 9*d*	Garlic, per lb.,	6*d* to 8*d*
Asparagus, per 100,	1*s* to 6*s*	Onions, per bunch,	2*d* to 8*d*
French Beans, per 100,	2*s* to 3*s* 6*d*	— large, per bushel,	1*s* to 3*s*
Autumn Potatoes, per lb.,	3*d* to 6*d*	— Spanish, per doz.,	1*s* 6*d* to 3*s*
Greens, per dozen,	1*s* 6*d* to 2*s* 6*d*	Shallots, per lb.,	3*d* to 10*d*
Potatoes, per ton,	60*s* to 110*s*	— Green, per bunch,	3*d* to 4*d*
— per cwt.,	2*s* to 3*s* 6*d*	Lettuce, per score,	6*d* to 1*s*
— per bushel,	1*s* 9*d* to 2*s*	Celery, per bunch,	6*d* to 1*s*
— Kidney, p. bush.,	2*s* 6*d* to 3*s*	— Young, per bunch,	1*s* 6*d* to 2*s*
Frame Potatoes, per lb.,	6*d* to 1*s* 3*d*	Mushrooms, per pottle,	1*s* to 1*s* 6*d*
New Turnips, per bunch,	4*d* to 9*d*	Small Salads, per punnet,	2*d* to 3*d*
Peas, per bushel sieve,	4*s* to 6*s*	Watercress, p. 12 sm. bun.	4*d* to 6*d*
Red Beet, per doz.,	6*d* to 1*s* 6*d*	Parsley, per hf.-sieve,	6*d* to 1*s*
New Carrots,	6*d* to 1*s* 6*d*	Tarragon, Green, per bunch,	3*d* to 4*d*
Radishes, Tur., p. 12 bchs.,	6*d* to 1*s* 6*d*	Green Mint, per bunch,	2*d* to 4*d*
Basil, per bunch,	4*d* to 6*d*	Marjoram, per bunch,	4*d* to 6*d*
Horse Radish, per bundle,	1*s* to 3*s*	Chervil, per punnet,	2*d* to 3*d*
Savory, per bunch,	6*d*	Cauliflowers, per doz.,	2*s* to 12*s*

POTATOES.—SOUTHWARK WATERSIDE, May 27.

SINCE our last, cold winds from the north and north-east have prevailed, accompanied by a good deal of blight; these, together, have proved injurious to fruit-trees and vegetables. The supplies in our Market during the past week have been comparatively small, and the best fresh good-conditioned samples have gone off readily at an advance on our last quotations; but where it was necessary to clear cargoes that were heated and dry-rotted, no advance could be obtained. Whites have remained nominally unaltered, yet the demand continues languid; and some small lots of Foreign remain in the Market, selling at 45*s* to 50*s*. The weather became cloudy toward the end of the week, and our Market resumed a more healthy appearance, and at the close the annexed prices were fully supported.

HOPS, FRIDAY, May 31.

ON account of the late cold weather, up to yesterday, the Hop fly had not increased since last week, and several persons became more anxious to sell; but yesterday being warmer, the accounts this morning state that the fly is again increasing, and our Market very firm.

PATTENDEN & SMITH, Hop-Factors.

WOOL.—BRITISH, FRIDAY, May 31.

As is usual at this season of the year, there is but little doing in our English Wool Market. Staplers are, for the most part, desirous of selling out their old stock remaining on hand, to make room for the new Wool. But few clips have, as yet, been bought; the Farmers are asking higher prices than the Staplers, with present prospects, can afford to give.

JAMES PERRIN, Wool Broker.

SMITHFIELD, MONDAY, May 27.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s* 8	to 3*s* 10	Best Downs & Half-breds	3*s* 8	to 4*s* 0
Best Short Horns	- 3 4	3 6	Best Long-wools	- - 3 6	3 10
Second quality Beasts	- 2 10	3 2	Ewes and second quality	3 2	3 6
Calves	- - -	4 4	4 10	Pigs	- - - - 3 4	4 0
Lambs	- - -	5 0	5 8		

Beasts, 2622; Sheep and Lambs, 30,280; Calves, 119; Pigs, 398.

This being Whit-Monday, the commencement of holiday-week, the Butchers are anticipating less trade, and, consequently, are not very eager in their purchases; our supply of Beasts is, however, moderate, and the best qualities make nearly as much as on this day week. Some Scots are making 4*s*, and some of the most selling Short-horns 3*s* 8*d* per 8 lbs, but cannot be quoted as average prices. The Mutton-trade is very heavy, and suffers a reduction of nearly 2*d* per 8 lbs; the supply is good, but all are sold. Lamb-trade is a little more cheerful, at about the same prices. Veal is rather a heavier trade. Pork remains steady.

FRIDAY, May 31.

Since Monday the dead trade has been rather better than was expected, in consequence, ours to-day is also brisker. Good Beef is not very plentiful, and rather dearer; best Scots, &c., 3*s* 8*d* to 4*s*, and Short-horns, 3*s* 4*d* to 3*s* 8*d*; second quality, 3*s* to 3*s* 4*d*. Mutton is also a little improved; the best Downs, &c., make 3*s* 8*d* to 4*s*, Longwools, 3*s* 6*d* to 3*s* 10*d*, and Ewes, &c., 3*s* 4*d* to 3*s* 8*d*, readily, and in some instances a little more. We have a large supply of Lamb, and much of it of very middling quality; the trade for it is very heavy: the weather continuing so cold is greatly against the Lamb-trade; the best are making 5*s* 2*d* to 5*s* 6*d*, large and second quality, 4*s* 8*d* to 5*s*. Veal is improved, the best Calves being worth 5*s* per 8 lbs. Pork remains at late rates.

Beasts, 668; Sheep and Lambs, 9730; Calves, 324; Pigs, 370.

41, West Smithfield.

PRINCIPAL MANURES.

	Weight per bush., about lbs
Alum, 240*s* per ton	—
Bleaching Powder (see Chloride Lime)	
Brimstone, 200*s* per ton	—
Bone-dust, —*s* and 17*s* per quarter	45
— Half-inch, 16*s* ditto	42
— Calcined, 8*s* per cwt	—
Carbonate of Ammonia, 60*s* p. cwt.	84
— of Lime, 1*s* to 1*s* 6*d* p. cwt.	—
— of Soda, —*s* to 30*s* p. cwt.	—
Chloride of Lime, 30*s* per cwt.	—
Graham's Phosphated Turnip Compost, 200*s* per ton	—
Graves, —*s* to —*s* per ton	—
Guano, Peruvian, 280*s* per ton	—
— Bolivian, 240*s* per ton	—
— African, 220*s* per ton	—
— Potter's, 240*s* per ton	—
— Potter's Liquid, 18*s* p. doz.	65
Gypsum (Sulph. of Lime), 30*s* to 35*s* per ton, at water-side	—
Hallett's Dry Fertiliser, 200*s* p. ton, or 12*s* per cwt.	—
— Concentr. Liq., 1*s* 6*d* p. bot.	—
Humphreys's Compound for Plants in Pots, 16*s* per doz.	—

Sulphur, —*s* to 15*s* per cwt.	—
Sulphuric acid, London, 2*d* per lb.	—
— Country made, 1½*d* per lb.	—
Whitney's Composition for Frames and Lights, 24*s* and 40*s* per doz.	—
Willey Dust, —*s* per ton	—

Mark Fothergill.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL; And by their Agents, COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL. 47, Lime-street, May 31, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms of MARK FOTHERGILL, 40, Upper Thames-street.

AT THE CORN MARKET, MARK-LANE, On MONDAY, June 3d, at 2 o'clock.

GUANO.—450 Tons Just arrived, per ANNA, from Ichaboe. Catalogues and Particulars to be had of W. KIRKMANN & Co., Brokers, 2, St. Dunstan's-hill, Tower-street.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 15*s.* per cwt. " Soda 12*s.* " " Magnesia 9*s.* " " Ammonia 1*s.* per lb.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5*l.* to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

MOST IMPORTANT TO FARMERS AND GRAZIERS.

GIBBONS' DISINFECTING OINTMENT, a most effectual and perfect cure for Epidemic and Foot-rot in Sheep; also for Epidemic and Foal in Cows' Feet, and for the Grease and Thrush in Horses; prepared only by HENRY GIBBONS, Agricultural Chemist, Wolverhampton.

This Ointment effectually destroys the American grub on Fruit-trees. Sold by all respectable Druggists in Town and Country, in packets at 2*s.* 6*d.* each. Mr. William Bailey, Manufacturing Chemist, North Street, Wolverhampton, is appointed Sole Wholesale and Shipping Agent.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls.*

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end.* Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2*s.* 6*d.* and 4*s.* 6*d.*, with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

WATER RAM.

Every kind of Garden and other Pumps, Well Engines, &c.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

SURPRISING EFFICACY OF "PARR'S LIFE PILLS."

Testimonial just received by the Hibernia from America.—Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn, L. I.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion; her bowels were sometimes constipated, and at other times lax, and never regular. At this period, she was recommended to try PARR'S LIFE PILLS, when no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.—Your's truly, To T. Roberts & Co. April, 1844. C. STEANE.

These and hundreds of other cases of decided cures, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine vendor's. The cures in many instances were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of Spurious Imitations of the above medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS & Co., Crane-court, Fleet-street, London," on the directions.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

TO ARTISTS, AMATEURS, ETC.

WOLFF and SON'S CRETA LÆVIS, or PERMANENT DRAWING CHALK, in various Colours.

E. WOLFF and SON beg to apprise Artists and Amateurs that they have, by the introduction of great improvements in their CRETA LÆVIS, enabled it to be used the same as the ordinary pencil; and effects can now be produced equal to water-colour drawings, without the use of water or any other fluid, the various colours blending together with perfect harmony, beauty, and richness. It can be cut to a fine point, and is thus capable of giving a very delicate outline. For sketching from Nature, the great advantages resulting from the adoption of the CRETA LÆVIS must be obvious, as without the use of water, palette, brushes, &c, all the various tints can be obtained with a truthfulness that cannot be surpassed. To be had of all respectable Stationers, and of the Manufacturers, at the following prices:—

Leather box, containing a set of	12	7*s.*	each.
"	18	10*s.*	"
"	24	14*s.*	"
"	36	21*s.*	"
In sets as above, without box, at		6*s.*	per doz.
Lake and Cobalt		12*s.*	"

*** May be had also in crayons, without cedar, in sets as above, at 6*s.* per dozen, box included.

Creta Lævis.—We have inspected an invention of Messrs. Wolff and Son. CRETA LÆVIS are permanent coloured Crayons, of nearly every hue and tint, differing essentially from those in general use, inasmuch as they do not cast off, and are clearer than chalk, retaining at the same time much softness and delicacy. We think they would be found useful to the sketcher, as they are portable, not easily injured, and can be used upon white or tinted paper. We can recommend them, especially to ladies, as we have seldom seen more charming specimens of flower-drawing than those produced by the CRETA LÆVIS: the blue, generally so coarse in chalk, was singularly clear; and many of the landscapes and heads submitted for our inspection proved that Mr. Wolff has made a valuable discovery.—*London Art Union.*

Instructions for Use.—To produce the delicate shades, the chalk must be cut to a fine point, and worked very lightly on the paper, blending the colours until the required tint be obtained. The deep shades merely require a broader point and increased pressure.—Bristol Board, Crayon Paper, or, in fact, any papers with a fine even surface, but not glazed, are well adapted for the CRETA LÆVIS.

WOLFF and SON beg to recommend their newly-invented SKETCHING PENCILS, or Permanent Black Chalks:—

B B, Very black, for foreground; H B, Middle tint; N, Neutral tint, for distance. Price 6*s.* per dozen.

These Pencils are peculiarly adapted for sketching heads and landscapes, and are capable of producing a beautiful effect with very little labour. Having an adhesive quality, the drawings may be transmitted without fear of injury.

*** Wolff and Son are desirous of opening an Agency with respectable Country Booksellers and Stationers for the sale of the above.—Manufactory, 23, Church-street, Spitalfields, London.

IMPORTANT TO FLORISTS, HORTICULTURISTS, AND OTHERS.

TANNER'S VITREOUS FLUID and CLOTH, being a SUBSTITUTE for the GLAZED FRAMES of HOTBEDS and CONSERVATORIES, &c.

The Proprietor, in introducing the above Preparations, feels confident a very important desideratum is presented to the Public, combining utility and economy.

A Conservatory or Greenhouse may be built at a very moderate cost, with all the advantages of Glazed Frames. A Forcing-bed covered with this cloth is not only less expensive, but yields many other advantages—not requiring the attention of the ordinary kind, admitting a more genial light, preserving a uniform dewy moisture on the Plant, maintaining, without any other covering, a moderate temperature under the strongest rays of the mid-day sun, and the atmosphere requires only to be changed from time to time according to circumstances. It affords a certain Protection for Fruit-trees, either from Frost, Blight, or excessive Heat, affording abundance of Light and Heat, for the expansion of the blossom, causing the Fruit to set and swell more freely, and much earlier.

The attention of the Nobility and Gentry is respectfully solicited to the above, which being Waterproof, and varying in texture, will prove equally suitable for Marquees, Blinds, covering Market Carts, Vans, &c.

Merchants and the Trading Classes will also find the above adapted for the Windows of Offices and Workshops, admitting a more agreeable light than glass.

Hand-Frames of various sizes, covered with the Vitreous Cloth, may also be obtained of the Proprietor, and Agents.

Manufactured and sold by N. W. TANNER, Chemist, Exeter.
Directions for Use of Fluid with each Bottle.

Any persons residing in large towns or cities, desirous of becoming Agents, are requested to make early application.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1s. 6d. each, and in bottles, six times the size, at 7s. 6d. The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

TURNIPS, &c.

DR. HALLET'S DRY SOLUBLE FERTILISERS, are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10l. per ton, or 12s. per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

AGRICULTURAL TABLES.

JENKIN JONES, Actuary and Secretary.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—
Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.
Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.
On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.
Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.
Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

NEW PROSPECTUS.

ALBION LIFE INSURANCE COMPANY, Instituted in 1805, New Bridge-street, Blackfriars. Bonus every Three Years. Eighty per cent., or four-fifths of the profits returned on policies effected on and after this day.
The New Prospectus, containing a full detail of the highly advantageous terms on which Life Insurances are now granted by this Company, may be obtained at the Company's Office.
1st May, 1844. EDWIN CHARLTON, Sec.

PROVIDENT LIFE OFFICE, 50, REGENT STREET, FEB. 15, 1844
BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued. GEORGE BEAUMONT, Actuary.

CORPORATION of the LONDON ASSURANCE: Established A.D. 1720.

LIFE ASSURANCE.—Great advantages are offered to the public by this office:—
An annual abatement of premium after five years' payment.
A lower fixed rate without abatement.
Fire Insurance effected upon every description of property, including rent.
Assurances are also effected on ships and merchandise at sea, and going to sea. JOHN LAURENCE, Sec.
Offices—19, Birchin-lane, and 10, Regent-street. Attendance daily from Ten till Four.

All the other LECTURES and EXHIBITIONS as usual. LONGBOTTOM'S PHYSIOSCOPE and OPAQUE MICROSCOPE, NEW DISSOLVING VIEWS, ARMSTRONG'S HYDRO-ELECTRIC MACHINE, &c. &c.—Admission, One Shilling. Schools, Half-price.

News of the Week.

THE IRISH STATE TRIALS after nearly four months' duration have at length been brought to a close, and the Court of Queen's Bench has pronounced its sentence on all the traversers, with the exception of the Rev. Mr. Tierney, who was not called up for judgment. The sentence upon Mr. O'Connell is TWELVE MONTHS' IMPRISONMENT and TWO THOUSAND POUNDS FINE. The sentence upon Mr. John O'Connell, Mr. Duffy, Mr. Ray, Dr. Gray, Mr. Barrett, and Mr. Steele, is—*nine months' imprisonment, and a fine of fifty pounds each.* Mr. O'Connell is further ordered to give sureties to keep the peace for seven years, himself in 5000*l.*, and two sureties in 2500*l.* each. The other traversers for the same period to give securities in 1000*l.* each, and two sureties for 500*l.* In order to make our summary complete, it is necessary to state that the motion for a new trial, which was argued at great length last week, was decided on Friday. The four Judges were equally divided in the case of Mr. Tierney; and one of them, Mr. Justice Perrin, was of opinion that the newspaper evidence ought not to have been admitted in the case of Mr. O'Connell. He thought, however, that there was ample evidence, independent of the newspapers, to warrant and sustain the verdict; but as he could not undertake to say whether the Jury would have thought so likewise, he was disposed to allow Mr. O'Connell a new trial. Mr. Justice Crampton disagreed with Mr. Justice Perrin in the case of Mr. O'Connell, and agreed with him in the case of Mr. Tierney; indeed, so strongly did he feel that the latter gentleman ought to have been acquitted, that unless the verdict could be set aside as against him, without being also set aside against the others, he would grant a new trial to all the traversers, rather than deprive Mr. Tierney of his rights. Mr. Justice Burton and the Chief Justice, on the other hand, concurred in the opinion that the verdict in regard to all the traversers was good in law, and that they had properly been found guilty on all the issues. The motion for a new trial was therefore refused generally. The Attorney-General then announced, that after what had fallen from two of the Judges in regard to Mr. Tierney, he should not call for judgment upon him. Mr. Justice Crampton, upon this, said that as Mr. Tierney had been released, he should at once concur with the Chief Justice and Mr. Justice Burton in refusing a new trial to the other traversers. Having failed on this point, the counsel for the traversers on Monday opened their arguments for an arrest of judgment, their objections being chiefly directed to the caption of the indictment, and to the too general and vague character of the different counts. The discussion of these points occupied the Court for three days, when the Judges unanimously refused the rule for arrest of judgment. The traversers then applied to the Court to allow the sentence which they might think fit to pronounce not to take effect until they have had an opportunity of obtaining judgment on a writ of error, which they intend forthwith to prosecute in the House of Lords. This application was refused on Thursday, and the Court immediately passed sentence.

From France we have accounts of the great debate on the supplementary credits. As anticipated some days ago, the pamphlet of the Prince de Joinville has supplied ample materials for an angry discussion, and the leaders of the different parties of the Opposition have coalesced for the purpose of making a combined attack on the foreign policy of the Cabinet. The affairs of Tahiti, New Zealand, China, and South America, have been again brought in succession before the Chamber, and from the warmth with which they have been discussed, it is evident that they have lost none of their interest as party questions. The main point of the Opposition speakers appeared to be the exposure of the alleged sacrifice of French interests, in order to maintain an understanding with England; while the object of the Ministry was to show that if they had avoided all cause of disagreement with this country, they had as carefully abstained from any act of complaisance derogatory to the honour and interests of France.—From the United States we have details of alarming riots in the city of Philadelphia, which the apathy or weakness of the authorities allowed to remain unchecked for three entire days. The rioters were the native Protestant Americans, and the Irish Catholic settlers in the city; they were, therefore, animated by religious antipathies, which are said to have been exasperated by the recent speeches at the Repeal meetings, exciting the hatred of the Catholic Irish against the Anglo Saxon-race. No riots of such a character and extent have occurred since the well-known "No Popery" riots of Lord George Gordon in 1780, and the results in this case have been equally disastrous, several lives having been lost, and two Catholic churches, a nunnery, two Catholic schools, and other public buildings having been destroyed by fire. The last accounts state that order has been restored, and that the amount of property destroyed will probably not be less than 200,000 dollars.

Home News.

COURT.—The Queen, accompanied by the Prince of Wales and the Princesses, arrived in town on Monday, from Claremont. Prince Albert had arrived previously, in order to attend the rehearsal of the Concert of Ancient Music. On Tuesday the Prince attended the triennial festival of the Eton Montem, travelling to and from Slough by a special train on the Great Western Railway. In the evening, the Queen and His Royal Highness honoured the Italian Opera with their presence. On Wednesday the Queen gave a dinner at Buckingham Palace to the Queen Dowager and the Directors of the Concert of Ancient Music, after which Her Majesty and her guests attended the performance of the Concert at the Hanover-square Rooms. On Thursday the Queen and Prince walked in the gardens of the Palace. The Queen Dowager, it is said, will leave England for Antwerp on Monday on her way to the north of Germany. The Ministerial papers state that the King of the French will arrive in this country, on a visit to Her Majesty, towards the latter end of September. The King will land at Portsmouth, and will be accompanied by a numerous suite of officers and attendants.—The retrenchments in the Royal household still continue, and the annual gratuity of materials for a dinner in commemoration of the Queen's birthday has this year been withheld from the servants at Windsor Castle. Upon all former anniversaries of the birthday of the Sovereign, the labourers in the Royal gardens have been presented with a gratuity of 5*s.*, in addition to half a day's holiday; but this year they have been deprived of their accustomed Crown present, but the half-holiday was given as heretofore.

Arrival of the King of Saxony.—His Majesty the King of Saxony landed at Dover on Monday under the usual salutes, and shortly afterwards proceeded by the South Eastern Railway to the Penshurst station, on his way to Buckhurst Park, the seat of the Lord Chamberlain, Earl Delawarr. His Majesty reached Penshurst about half-past 6, and was received by Lord and Lady Delawarr, Prince Edward of Saxe Weimar, Lord and Lady Amherst, Lord and Lady Wilton, and other visitors invited to meet him. On Wednesday the King visited Knole Park, the seat of the Earl and Countess Amherst; his Majesty inspected the various objects of interest in that ancient seat, and partook of a *dejeûner* with his lordship. On leaving Knole, the King honoured Mr. Wells, of Redleafe, with a visit, and inspected the gardens and the collection of pictures for which Redleafe is remarkable. His Majesty then proceeded to the ancient mansion of Penshurst Place, the old seat of the Sidney family, where he was received by Lord De Lisle, the present owner of the estate. The King then returned to Buckhurst, where a select party of guests was invited to meet His Majesty at dinner. On Thursday morning His Majesty left Buckhurst for Portsmouth, visiting the chain pier at Brighton, Arundel Castle, and Chichester Cathedral on his way. On arriving at Portsmouth, the King proceeded direct to the Port Admiral's residence, where a select party of officers was invited to dine with his Majesty. Yesterday morning the King inspected the docks and arsenal, and at a later period of the day embarked for the Isle of Wight, where it was expected His Majesty would sleep. The King travels under the assumed title of the Count de Hohenstein.

Parliamentary Movements.—The election for South Lancashire terminated on Tuesday in the return of Mr. Entwisle, the Conservative candidate. The numbers were, for Mr. Entwisle, 7571; for Mr. Brown, 6973; majority, 598.—Lord Arthur Lennox has been again returned for Chichester without opposition.—The Hon. Mr. Bouverie, the League candidate, has been returned for the Kilmarnock Burghs by a majority of 10. The numbers were, for Mr. Bouverie, 389; for Mr. Prinsep, the Conservative candidate, 379; for Mr. Vincent, Chartist, 98. Mr. J. Robertson had previously retired.—Sir Thomas Fremantle has been re-elected for Buckingham without opposition.—It is rumoured that Lord W. Paget will shortly resign his seat for Andover.

Foreign.

FRANCE.—The sensation caused in Paris by the pamphlet of the Prince de Joinville has almost been exceeded by that which followed the announcement of the death of M. Jaques Laffitte, who expired at his house in Paris on Sunday evening. M. Laffitte had been suffering for some days from a pulmonary affection, which greatly alarmed his medical attendants; on Sunday morning a favourable change took place, which led to

some hopes of his ultimate recovery, but towards evening he became so much worse that it was evident his end was approaching, and, after severe suffering, he expired. M. Laffitte was in the 77th year of his age. He has left one daughter, who is married to the Prince of Moskowa, the son of Marshal Ney, and who has several children. The death of M. Laffitte is an event of importance, not in a political light alone, but as the head of a great financial firm. He was the oldest member of the national representatives of France, and was undoubtedly the most popular of the public men in France. In his political career he was always a consistent friend to liberty, and he stood firm to the principles of the revolution which raised the Orleans dynasty to the throne, after many of the most active partisans of that event had deserted the cause.—The discussion on the supplementary credits, which was expected to be influenced by the Prince de Joinville's pamphlet, commenced on Monday, and is expected to last the whole week, and probably a part of the next week. Every subject of political interest that now agitates the French political horizon will be introduced. Tahiti, Texas, England, Algiers, and New Zealand, will each be brought in succession upon the tapis, and most of these topics will afford ample scope for attacks upon England. The debate on Monday was opened by M. Carré, in a speech of little moment, which was followed by another tedious one, which M. David, the late Consul of France at Smyrna, read to an inattentive audience; M. Berryer then ascended the rostrum, and delivered an oration, the splendour of which all the Opposition prints extol. Availing himself of a sum of 950,000 francs, required by the Foreign Department for couriers, travelling, extraordinary and unforeseen expenses, the eminent Legitimist Deputy began by declaring that in all the distant negotiations or expeditions undertaken by the present Government, there was a wish to afford a momentary satisfaction to the interests and honour of France, but that hesitation soon followed these attempts, which, ultimately, always proved detrimental to the national dignity. M. Berryer then entered into a narrative of the steps the Government had taken in 1838, and the two following years, in order to form a settlement in New Zealand, and accused the Ministry of having pusillanimously deserted the French settlers in that quarter, in compliance with the groundless pretensions of this country to prior possession. To make up for this ignominious relinquishment of the rights of France, and soothe her wounded honour, the occupation of the Marquesas islands was ordered, evidently with the view of making other conquests in the same seas, as the secret instructions issued to Captain Bruat would, no doubt, prove, could a communication of their contents be obtained. The consequence was the protectorate and subsequent occupation of Tahiti, into the details of which M. Berryer entered at great length, drawing his conclusions from the documents laid before the Chamber, vindicating the proceedings of Admiral Dupetit Thouars, and inveighing against the equivocal and dastardly conduct of his employers. It required all the brilliancy and vehemence of M. Berryer's oratory to impart so much interest to his representation of these oft-discussed occurrences. From the Society Islands he turned to China, and charged the Government with having likewise sacrificed the commercial interests of France in that quarter to the pleasure of England, by suffering the Consul, M. Ratti Menton, to disavow their acknowledged agent, M. de Jancigny, who had first been sent thither, and had entered into direct negotiations with the Chinese authorities. Although he spoke near an hour and a half, M. Berryer postponed the conclusion of his speech to the next day, and the Chamber immediately adjourned. On Tuesday the debate was resumed, and M. Berryer concluded his speech. M. Guizot then rose to reply to him, and stated that his opponent had distorted many facts relative to New Zealand, and was ignorant of others; that at Tahiti, Admiral Dupetit Thouars had substituted for the Protectorate a state of things injurious to the interests of France, and that in those islands there unfortunately existed a turbulent minority ever ready to kindle commotions. M. Guizot also adverted to the policy pursued by his administration in the East and other quarters, and in the course of his observations upon New Zealand was interrupted by M. Thiers, who said that it was incorrect to say, that because the English had arrived first in New Zealand they should be considered the righteous owners of a territory which was as large as the British islands. M. Guizot replied, that the French could only lay claim to a certain extent of territory, and not to the sovereignty of the islands. Failing in its intentions to establish a station in New Zealand, the Government had directed its attention to another part of Oceania, and the result was the occupation of the Marquesas, and the establishment of the protectorate over the Society Islands. M. Guizot observed, that the Chamber having approved the solution given by the Ministry to the question of Otaheite, and nothing new having occurred since, he would not again entertain the subject. At Buenos Ayres French interests have been secured by the treaty, signed by Admiral de Mackau, and the French residents on the banks of La Plata were placed in the most enviable situation, since they were to be exempted from the military service, the duties of the militia, and all war and extraordinary taxes. As regarded Hayti, France had recognised her independence; but should that republic cease to be completely independent, or neglect to fulfil her obligations towards France, the latter was at liberty to adopt whatever course she deemed expedient. M. Guizot then referred to the mission to China. It was not true that M. Jancigny had been charged with a mission to that country; he was merely sent to follow the English expedition, and to give an account of its operation; he had never had powers to negotiate. The extraordinary ambassador now on his way to China was not to proceed to Pekin, but to open negotiations on whatever point the Celestial Government might be pleased to fix. The English Plenipotentiary had not been obliged to repair to Pekin to obtain advantageous terms from the Emperor. The French negotiator was as favourably placed to treat as the English commissioner; a powerful naval force was at his disposition, and everything had been combined to give the Chinese authorities an adequate idea of the power of France. M. Guizot then concluded by declaring, that if the present Cabinet carefully avoided all that might tend to weaken the good intelligence existing between two great nations, in no instance had it been guilty of an act of complaisance derogatory to the dignity and interests of the country.—On M. Guizot quitting the rostrum, M. Billault ascended it, and by alluding to the Prince de Joinville's pamphlet on the naval forces of France, imparted much animation to the discussion, in which M. Guizot, the Minister of the Navy, and MM. Lanjuinais and Berryer took part. M. Guizot, in reference to the Prince De Joinville's pamphlet, proved that the navy had not been neglected by the administration, but, on the contrary, had been increased more by the present Cabinet than by their predecessors. He further observed that since 1837 upwards of fifty-two millions had been expended on the improvement of ports and harbours for the use of the navy. On Wednesday M. Thiers spoke, and began by censuring the recall of Admiral Dupetit Thouars. He then applied himself chiefly to the affairs of South America, and to the course pursued by the Government's officers and agents in the River Plate. He bewailed the position in which the French residents at Monte Video had been placed by them, and observed upon the comparative firmness which Commodore Purvis had displayed in behalf of the few English residents. Admiral de Mackau replied to M. Thiers, and was speaking when the despatches left Paris.—The bill on secondary instruction passed the Chamber of Peers on Friday, after a discussion which occupied 27 days, but so altered and mutilated as to disappoint the movers of it, and probably to insure its rejection by the Deputies when it comes before them next session.—The Nismes and Montpelier Railroad Bill passed the Chamber of Deputies on Friday by a majority of 190 to 60. The bill provides, that should no company offer for the road acceptable terms, the Government should manage it for the public benefit.

SPAIN.—We have accounts from Madrid of the 21st inst. The two Queens and the Infanta left the capital on the 20th, and arrived in the evening at Quintanar de la Orden, and had immediately repaired to the church, followed by the inhabitants. The next place they were to sleep at was Almansa. General Shelly had just left Madrid, to assume the station of Capt.-General of Seville. The Ministerial prints still dwell on the rumours current respecting the object of the Queen's journey to Catalonia; and deny that any reaction is contemplated, or that the Queen will return with a consort from Barcelona. The journals of Barcelona of the 22d contain a proclamation of the authorities, announcing that the Queen is either to dine or sleep at Valencia on the 22d, and that she will forthwith proceed by sea to Barcelona. The inhabitants are exhorted to display on the arrival of "their idolised Queen," and the 'immortal Donna Maria Christina," as much delight and enthusiastic affection as they possibly can. It is said that the "Army of Catalonia" is to treat the Queen to a sham attack and capture, by sea, of the Atarazanas, which they were some months ago scarcely able to capture by land. The Carlist Chief, La Coba, who kept the Maestrazgo for Don Carlos since 1833, and two of his officers, had been taken prisoners and shot. General Zurbano had returned to Spain, and would probably receive the command of a division in the projected expedition against Morocco.—Some of the Madrid papers speak of the decided spirit of absolutism and reaction exhibited by the Government and the Court as likely to lead to a new and sanguinary revolution, that will endanger the Crown itself. The *Gazette* contains a Royal decree, granting to the Countess de Belascoain, the widow of General Leon, and her children, a pension of 45,000 reals per annum. The municipal elections commenced at Madrid on the 18th, but, owing to a violation of the decree of the 30th of December, 1843, for which the Liberal Junta vainly sought redress, the Progresistas abstained from voting. The Cadiz papers announce that a force of 5000 or 6000 Moors, provided with artillery, had approached the walls of Ceuta.

PORTUGAL.—The subjoined telegraphic despatch reached the French Government on Tuesday:—"Bayonne, May 27.—We are assured that the Portuguese Ministry has been modified as follows:—M. Costa Cabral, Minister of the Interior and President of the Council. Brigadier Cordiero Furtado, Minister of War. Baron de Catania, Minister for Foreign Affairs. M. Lopez Pastors, Minister of Finances. M. Ferragenti, Minister of Justice. M. Duque de Fonseca, Minister of Marine." The Cortes have been further prorogued to the end of September. The troops commanded by the Baron de Leiria had returned to Lisbon from Almeida, and 300 of those of Count Bomfim, who had surrendered on terms had been sent to the Azores, ultimately destined for the coast of Africa.

SWITZERLAND.—By accounts received from Lausanne, of the 22d ult., it appears that the struggle between the Higher and Lower Valais is brought to a close by the complete dispersion of the militia of the Lower Valais. On the morning of the 21st, the troops of the Lower Valais, in effecting their retreat upon Martigny, were attacked at the defile of Trient. The battle was a long one, and thirty were killed. Four hundred of the Lower Valais troops endeavoured to cross the river by a ford under a hot fire; the rest, to the number of about 200 men, retreated to Martigny, where they dispersed. M. Jorris, one of the leaders of the Lower Valais, arrived at the baths of Vevay with about 250 men. The affair may thus be considered for a time at an end. It is, perhaps, fortunate that the opposing parties were of such unequal strength, for the prolongation of the struggle would have brought on a collision between the Cantons. The two parties that divide the Valais are unfortunately violent and irreconcileable in their opinions. The Lower Valais or Young Switzerland represents the more popular opinions. The High Valais represents the equally violent opinions of the old aristocracy, under the influence of the Jesuits of Brig, and there is not among the population a sufficient number of persons of moderate opinions to keep the two or three parties in check. Most of the other cantons, however, have called out troops for the protection of their respective territories. The Canton of Vaud has even sent a battalion into the Valais. The question of convoking an extraordinary diet for the adoption of measures for the maintenance of general tranquillity has been resolved affirmatively by several of the Grand Councils, and there is therefore no doubt that the contest will be effectually terminated by the interference of the Government troops.

GERMANY.—Letters from Vienna state, that the project of a marriage between the Grand Duchess Olga of Russia, and the Archduke Stephen of Austria is far from being abandoned. Prince Knauer, Bishop of Breslau, died on the 16th ult. in that city.—It is believed that the German Diet will not sanction the title of Royal Highness assumed by the Dukes of Saxony, but will propose the modification of "Ducal Highness," which will be accepted.—A letter from Vienna announces that it is intended to construct a railway upon the atmospheric principle, which would extend from thence, by the way of Hiertzing and Miedberg, to Huttelsdorf, following the left bank of the Wien, a company having been formed for the purpose at Vienna. The enterprise will cost 120,000*l.* sterling. The whole of the shares, which are for 1000*l.* sterling each, were taken on the day the prospectus was published.—At a general meeting of the association formed for the completion of the Cathedral of Cologne, which was held in that town on the 6th ult., the central committee produced its accounts for the years 1842 and 1843. The total receipts for those two years have been 90,449 crowns (13,500*l.*) The subscriptions of the inhabitants of Cologne amount to 39,591 crowns out of this sum. The *Grande Harmonie* of Brussels, figures for 890 crowns, the produce of a concert which it gave on the inauguration of the international line of railway. In the course of 1842 and 1843 committees for collecting and urging subscriptions were organised in the principal towns of Germany, as a means of accelerating the completion of the national edifice.

ITALY.—Accounts from Malta to the 13th ult., state that at the close of April the insurgents in Calabria had not yet been reduced to submission, and that the Royal troops had even been obliged to evacuate certain points, and concentrate in others. No apprehensions that the insurgents (if still in existence) would commit further disorders were, however, entertained in Naples on the 13th. A decree had been issued prohibiting the export of grain, because of the scarcity that prevailed in the Neapolitan dominions. The papers add that several desertions had taken place from amongst the officers of the Austrian ships of war Adria and Creole, whilst at anchor in Malta harbour.—The Pope has addressed a letter to the Roman Catholic Archbishops and Bishops, calling their attention to the efforts which are being made by various Bible Societies, and particularly by the Christian Society of New York, to produce religious dissent in Italy.—An epidemic disease for some weeks past, has spread alarm in the neighbourhood of Rome. Its ravages are not confined to the valleys and other low parts of the country; on the contrary, it rages more especially among the inhabitants of mountainous districts. In the little town of Tivoli, containing about 9000 inhabitants, 90 persons died in the space of a week. The malady is generally supposed to be contagious, but of this fact there is no positive proof. In every case in which post mortem examination has taken place there has been found congestion of the brain, as in apoplexy. It appears to be the same complaint which has recently prevailed in Naples and Sicily under the name of *torcicollo*. It is said to be clearly traceable to atmospheric causes, and is usually fatal in the space of 12 hours. In Rome, however, it has been only sporadic, and without any confirmed character.—Some further arrests had taken place in Rome. Among the parties so arrested were a Tuscan nobleman named Malenchini, the two sons of Count Spada of Macerata, and M. Monteri, besides some 30 individuals of less rank.

SWEDEN.—A short time ago Prince Gustavus Wasa, a general in the Austrian army, who lost his right of succession to the Swedish throne in consequence of his father's abdication subsequent to the revolution of 1809, forwarded to the cabinets of the Five Great Powers a kind of manifesto or protest on the occasion of King Oscar's recent accession to the throne of Sweden. Several of the Five Courts, from motives of courtesy at least, acknowledged the communication. His present Majesty has just replied to the first manifestations of his antagonist's pretensions by a Royal ordinance, in which he abolishes the decree passed in 1812, which prohibited all

communication with the former reigning family. His Majesty, by this act, has shown his confidence in the attachment of his people, and also that his dynasty is so well secured as to be under no apprehension of a pretender to the throne.

UNITED STATES.—By the Hibernia steamer, which left Boston on the 16th and Halifax on the 18th ult., we have accounts from New York to the 15th. They contain lengthy accounts of some dreadful riots which had taken place in Philadelphia, and lasted three days, the contending parties being the native Americans and the Irish inhabitants of that city. The former appear to have had the best of the contest, having kept possession of the battle-ground after burning two Catholic churches, a Catholic nunnery, two Catholic school-houses, a market-house, and about eighty-four dwelling-houses; but the worst remains to be told—several lives were sacrificed, and numerous persons received dangerous wounds. The authorities, either from lack of energy and good will, or from want of a sufficient force, were quite unable to put down the rioters until their fury was spent. In the midst of the riots the native Americans held a meeting, and paraded the streets carrying an American flag torn and defaced, having on it in large letters, "This is the flag that was trampled upon by the Irish Papists." The Bishop of Philadelphia issued an appeal to the Catholics, calling on them to shun all public places of assemblage, and to do nothing that in any way should exasperate. Notwithstanding this, according to the private correspondent of the *Morning Chronicle*, "all the evil-disposed persons in the community were bent on mischief, caring little for either Protestant or Catholic, so that their evil propensities might be gratified; and in large cities like Philadelphia, which, with its suburbs, contains nearly 300,000 inhabitants, there were, of course, but too many such. Men and boys of this class were active among the rioters, and in this, as well as in other features, a spectator could not fail to be struck with the resemblance the three days' riots presented to the well-known "No Popery" riots of Lord G. Gordon, in London, A.D. 1780. The writer adds that efforts were subsequently made by the mischievously disposed to excite the people to further acts of outrage. Amongst them small bills had been circulated, describing the horrors of the massacre of St. Bartholomew, in which 70,000 French Protestants were killed, August 24, 1572. False and inflaming rumours, too, abounded; such as the "Irish have captured the arsenal and arms at Frankfort (six miles off), and are marching towards the town." Of course there was not a syllable of truth in this, which was a wicked report got up to excite. As another proof how far prejudice extended under the influence of existing excitement, there were many who believed and argued that "the Catholics were conspired to govern the United States, but that they began their operations too soon." The writer just quoted adds:—"Among the dangerous elements that have been at work it occurs to me that some of the speeches at the Repeal meetings in this country, as well as in Europe, have been too furious on the subject of 'hatred to the Saxons—to the Anglo-Saxons'—and I assure you that here this hatred has been urged by orators, addressing the Catholic Irish in the most bitter terms. The Americans, however they may quarrel at times with England, and differ as to forms of Government, still remember and cling with pride and affection to the name of Anglo-Saxon, a race in which they glory, and the energy and skill of which they possess. Think you that they can be pleased with expressions of hatred against their race? Assuredly not. Surely those men have much to answer for on both sides, who foment feelings of national hatred in the human breast. Heavy will be their reckoning! I refer to the sentiment so inculcated, as it was probably one of the elements that produced a popular frenzy, even to blood-shedding, amongst a naturally excitable body of men, on whom it has been over and over again impressed—unconsciously to themselves." The latest accounts state that order was at length restored, and law had the ascendancy. Governor Porter had arrived, and promptly issued a proclamation for the suppression of the disturbances and the arrest of the rioters. The reported list of dead and wounded was said to embrace:—Killed, 14; wounded, 39. It is thought however that many persons have suffered from these scenes of violence who are not included in the above list. The amount of property destroyed is probably between 100,000 and 200,000 dollars, which sum the county will undoubtedly be compelled to pay.—The only news of political importance by this arrival is the defeat of the Tariff Bill, a subject which has long engaged the attention of the Legislature of the United States. Regarding the annexation of Texas nothing further has transpired, and on the Oregon territory dispute the papers are quite silent. From Texas, however, we learn that the feeling in favour of annexation is gaining ground. From Hayti we have accounts of the complete overthrow of the Mulatto Government. A vessel which had arrived from Port Republicain brings advices that the blacks have been entirely successful in their engagements with the Government troops. Herard's forces had disbanded in the north, and he took refuge in Port Republicain, but was hotly pursued by a superior force, and it is believed he could not hold out many days. The Revolutionists have established an independent government in the Spanish part of the island. The French Admiral lay off Port Rep, with three frigates, waiting the issue of events. He would probably take possession of the island, and the expected failure of the Government to pay the indemnity due to France would be used as a pretext for that purpose. The black population have been fighting for a republican form of government instead of a military despotism. It was thought that the possession of the island will cost France much more than any pecuniary advantage she can ever expect from it.—Letters from Canada state that Sir C. Metcalfe had been operated upon for cancer in the face; and the opinion of the operator, Mr. Pollock, was, that the disease was entirely eradicated. His Excellency was doing well. He bore the operation itself, and the subsequent cauterisation, with the greatest fortitude.

Parliament.

HOUSE OF LORDS.

Thursday.—The House reassembled this day after the Whitsun recess.—The LORD CHANCELLOR intimated that, on Tuesday, he should be prepared to lay on the table a Bill relative to Presbyterian marriages.—Lord BROUGHAM moved for certain returns with the object of showing the necessity of dividing the Northern Circuit into two circuits.—The LORD CHANCELLOR said that it would be impossible to make any effectual alteration before the next circuit, but the Government had turned its attention to the subject, and were devising the means of making some effectual alteration before the Spring circuit.—On the motion of the Earl of DALHOUSIE, the Wool Duties (Customs) Bill was read a second time and ordered to be committed. The discussion to be taken in the committee.—On the motion of Lord WHARNCLIFFE, the Bill to amend the Act for empowering parliamentary grants by the committee of Privy Council for the education of the poor was read a second time.

Friday.—In answer to some observations by the Marquis of NORMANBY, in reference to a late trial for Ribbonism, at the Monaghan assizes, in which case it was alleged that seven persons were struck off the jury because they were Roman Catholics,—Lord WHARNCLIFFE said that he did not think the noble Marquis had much to complain of; it was true that certain persons had been struck off because they were Roman Catholics; but it must be recollected that the offence for which the parties were tried was Ribbonism, which was an offence almost entirely confined to Roman Catholics. In every case where a Roman Catholic had been struck off, a sufficient reason had been assigned.—After a remark from Earl FITZWILLIAM, the Marquis of NORMANBY complained that Roman Catholics should be viewed with suspicion as soon as they approached the jury box; so much so, that the course of justice was thereby interfered with.—Lord WHARNCLIFFE denied that the parties in question had other than justice awarded to them.—The House then resolved itself into committee on the Factories Bill. Lord KINNAIRD said there was a clause in the Bill which went to establish altogether a new principle. He referred to clause 32, which sanctioned the interference of the legislature with the hours of labour. When the committee came to that clause he should move that it be expunged. Clauses up to the 14th were then agreed to. (Left sitting.)

HOUSE OF COMMONS.

Friday.—On the House resolving itself into committee, Sir G. CLERK proposed that 11,363*l.* be granted for the maintenance of the ecclesiastical establishments in British North America.—Mr. W. WILLIAMS protested against making large grants of money for such purposes, after such enormous grants of money had been made from the lands in Canada for the maintenance of the clergy. He could not conceive on what possible ground the people of England should be called upon to pay such large sums of money for such a purpose, as the people of Canada were much better able to do so. He should certainly take the sense of the House on this vote.—After a few words from Mr. HUME, Lord STANLEY said that a gradual reduction was being made in these votes, and that ultimately they would cease.—Mr. W. WILLIAMS said that, under these circumstances, he would not trouble the committee to divide.—The vote was then agreed to. The next vote was 18,895*l.* for the charge of the judicial departments in Canada, which was also agreed to. The next vote was 11,282*l.* to defray the charge of the colonial lands and emigration board, and other expenses of emigration from this country to the colonies.—Mr. VERNON SMITH made some observations on the subject of colonial immigration.—Lord STANLEY said he had requested from the authorities in India some information for the guidance of Government respecting this subject, which, for the sake of the West Indian colonies, he was desirous of encouraging, under safe regulations.—Mr. HUME advocated an entire freedom of transit for labour.—Mr. HAWES, on the contrary, was anxious for the careful interposition of the Government, lest, under the colour of immigration, there should be a revival of the slave trade and the whips.—Mr. BERNAL and Mr. P. STEWART protested against these imputations on the dispositions and intentions of the West Indian planters. The vote was agreed to. The next vote was 49,700*l.* for the salaries of stipendary magistrates in our West India colonies, in the Cape of Good Hope, and at the Mauritius.—Mr. WILLIAMS objected to taxing the people of England for stipendiary magistrates to protect negroes. The blacks, being now free, should pay like other free people for their own magistrates. These offices were retained upon our estimates, he believed, for purposes of patronage.—Lord STANLEY explained, that patronage had nothing to do with the matter; but, as the state of colonial society improved, these offices would be gradually dispensed with.—Colonel SIBTHORP hoped Mr. Williams would divide, for the sake of showing the country that of the popular members there were present only eleven, two of whom were fast asleep.—Mr. HUME said, that the large attendance on the Ministerial side was probably owing to the "whips." However, as reduction was promised, he would advise Mr. Williams to refrain from dividing.—Mr. WILLIAMS acted on this advice, and the vote was agreed to. The next vote was 12,000*l.* to aid the local legislatures in providing for the religious and moral instruction of the negro population.—Agreed to. 35,000*l.* were voted for the support of captured negroes and liberated Africans. Upon the vote of 24,000*l.* being proposed for expenses incidental to commissions appointed under treaties of England with foreign powers, for the purpose of putting an end to the traffic in slaves, Mr. HUME said that the proper way to proceed in order to put an end to the traffic in slaves was, to make slave-labour of little value; that was better than what he might designate the mad crusade kept up on the coast of Africa. We wasted our treasure and human life to an enormous extent in a fruitless attempt to put an end to the slave trade, which object could only be accomplished by such an encouragement of free labour as would make slave-labour of no value.—After a few words from Captain PECHELL, the vote was agreed to.—The next vote was 107,300*l.* for the expenses of Consular establishments abroad.—Mr. WILLIAMS and Mr. HUME protested against the unnecessary expense of keeping up Consuls and Vice-Consuls where there were resident Ministers, and thought the items required explanation.—Sir G. CLERK defended the vote, which was ultimately agreed to.—The next vote was a sum of 20,000*l.* for extraordinary expenses of Ambassadors at foreign Courts.—Mr. WILLIAMS complained of the amount of this vote, and contrasted the expense and efficiency of our Ambassadors at foreign Courts with those of the representatives of the United States, in both which respects the comparison was much to the prejudice of this country. Ministers might effect very material reductions in every one of the items constituting this vote without at all impairing the efficiency of the service.—After a few words from Sir G. CLERK, the vote was agreed to; as were the following:—85,800*l.* for Civil Superannuation Allowances, and Compensations to retired public officers; 6200*l.* for relief to Toulonese and Corsican emigrants, Dutch naval officers' widows, St. Domingo sufferers, American loyalists, and others. 1850*l.* for the National Vaccine Institution. 3000*l.* for the Refuge for the Destitute. On the question that a sum not exceeding 12,100*l.* be granted for the support of Polish refugees and distressed Spaniards in this country, for the year ending 31st March, 1845, being proposed, Mr. HUME said he never could allow this vote to pass without taking the opportunity it afforded of expressing his deep regret at the present degraded state of the Polish nation. The occurrences of each succeeding year brought to the mind of those who were anxious for their regeneration grounds of alarm and apprehension, while the apathy of the country in the matter was really lamentable. He hoped that Government would do something to alleviate the severity of the treatment received by the Poles at the hands of the autocrat. He understood that they were to see him here this season; but he could not conceive how he could show his face with decency in this country.—The vote was agreed to.—4979*l.* for sunday allowances, formerly charged on the Civil List.—Agreed to. 2154*l.* for bounties and other charities in Scotland, formerly charged on the hereditary revenue.—Mr. HUME, on this vote, took occasion to object to the practice of giving pensions to literary men. It had the tendency, he maintained, of making them dependent upon, and subservient in their writings to, those who bestowed pensions, and he instanced the case of Mr. Southey as a case in point.—Sir R. PEEL must enter his decided protest against these doctrines. He admitted that if you took an author who had advocated popular opinions, and if—to induce him to change those opinions—you gave him a pension, that that was a corrupt exercise of power. But when they looked to the men who had of late received pensions from the State—such men as Professor Airy, and Mr. Owen, the curator of the museum of the College of Surgeons, for example—when he knew that such gentlemen had, by their devotion to scientific pursuits, sacrificed many opportunities of gaining wealth—when their pensions were bestowed without the slightest inquiry into their political opinions—without imposing on them the slightest terms or condition—when he saw the Crown making such selections once a year of distinguished scientific men—ay, and women too, as witness Mrs. Somerville—he could not imagine that the bestowal of the just reward of merit involved the slightest tie upon the independence of those who thus received it. He repeated, that he knew not what might be the political feelings of the distinguished individuals whom he had named. In every case the bestowal of the pension had been accompanied by a distinct statement that it was not a retainer—that it had nothing to do with the recipient's political opinions. He certainly thought that there ought to be some provision which would enable individuals to devote their lives to science in a state of things in which proficiency in science was unaccompanied by pecuniary reward. In the case of Mr. Owen, that gentleman would not have been able to continue certain works in which he was now engaged, had it not been for the pension granted to him. There was another case of late occurrence, in which pensions of 10*l.* a year had been granted to two aged female relatives of the poet Burns. Now, did anybody object to that? Did anybody think that evil could possibly arise from rescuing from poverty and misery two persons connected with a great poet, of whom his country was so justly proud? The very last case in which a small pension was bestowed, was in that of Miss Heriot, a distressed descendant of George Heriot, who founded the great charity bearing his name in Edinburgh, and who, by that act of munificence, had left his family in distress. Was it not right that the Crown should in such cases have the power of conferring small pensions? It would be a scandal to our name and nation to have no such provision to be bestowed in cases where only, without it, a public subscription could raise families from want, and which could not be set on foot in so many cases without wounding nice feelings, and giving rise to honourable scruples. He did think, in an ancient Monarchy like this, that in such cases the Crown should have the power of stepping in and rescuing merit from submitting to what it felt to be a great degradation.—Mr. COLLETT remarked that Mr. Southey's opinions had undergone a change after the bestowal of his pension,—Sir R. PEEL replied that it was well known that in consequence of that great man's application to scientific and literary pursuits his health and intellect had failed him; but it was utterly ridiculous to suppose that for a paltry pension and the commutation of an allowance of sack, such a man as Mr. Southey would have bartered his opinions. Did any one think that Mr. Wordsworth would sell his political freedom of thought for a price? Let honourable gentlemen rest assured that the feelings of literary men put them far above such actions. They might be gratified by the distinction bestowed, but to suppose that men like Wordsworth and Southey would have been influenced by a paltry 100*l.* a-year and a butt of sherry, would, he sincerely believed, be doing a great injustice to both their names.—Mr. WAKLEY could not agree that literary men should be excluded from pensions. So far he differed with his hon. Friend the Member for Montrose. Such a distinction would be unwise and invidious. But he did object in one of the cases cited, to the pension bestowed—that given to Mr. Owen—and he believed that that was the general feeling in the profession which he had the honour of belonging to. The College of Surgeons had the power of pensioning Mr. Owen on a scale commeasurate with his merits.—Sir R. PEEL remarked that the pension was but 200*l.* a-year. Mr. Owen had devoted to pursuits connected with comparative anatomy talents which, in another sphere of life, might have been the source of great emolument to him. He had referred to several eminent men, the question of who was at present the most eminent man, connected with medical science; and the general voice of Europe had assured him that, since the death of Cuvier, Mr. Owen was the most distinguished anatomical student; and he was told that if the Crown could bestow upon him a small pension, it would have a most advantageous effect, as enabling him to devote his leisure to the preparation of two works, for the completion of which he would otherwise have no time.—Mr. WAKLEY said, a Right Hon. Baronet opposite had lately obtained a new charter for the College of Surgeons; and it was now announced to the public, through the Prime Minister, that one of the chief officers of that institution—a paid officer—was absolutely obliged to look to Government for a reward for his labours. The College of Surgeons was in the receipt of many thousands of pounds every year from persons applying for their diplomas; and yet it was announced that they could not afford to give their own officers rewards commensurate with the great services they had rendered to the community. Mr. Owen had obtained considerable renown; he had bestowed great attention on the science of anatomy, and especially comparative anatomy: and it was the duty of the institution whose officer he was to give him proper compensation for his services. For 40 years the college had been expending their funds for other purposes instead of rewarding their Officers.—Sir R. PEEL considered that the Government and the College of Surgeons had acted with perfect propriety. It was the duty of the College of Surgeons to attach a certain salary to a certain office, and they ought not to increase that salary on account of the talent of the man who occupied the situation. The sum of 200*l.* a year was sufficient to procure for them the services of a person competent to discharge the duties of curator; and he (Sir R. Peel) thought the college would not act properly, if they varied the amount of salary according to the personal qualifications of the individual upon whom that office was conferred.—Mr. HAWES complained that enough had not been done for Mr. Soane, the son of Sir John Soane.—Mr. HUME remarked that, with respect to the case of Miss Heriot, as cited by Sir Peel, there must be some mistake, as George Heriot had left his money for charitable purposes, because he had no relatives or friends to

bequeath it to. As to the case of Mr. Soane, he begged to remark that he himself was a witness to having heard Sir John Soane say, that he had left ample means for the support of his family, but tied up in such a manner that they could not destroy or make away with it.—Mr. HAWES explained that the money was left to other branches of the family, not to the son, Mr. George Soane, whom his father disinherited.—The vote was then agreed to, as were also a variety of miscellaneous votes, including 5000*l.* on account of the Agricultural Museum at Edinburgh, 2000*l.* in aid of the building of conservatories in the Botanic Gardens in Dublin, and 1500*l.* towards defraying the expense of monuments to the memory of Sir Sydney Smith, Lord de Saumarez, and Lord Exmouth. The Gold and Silver Wares Bill was read a third time and passed.—The Courts-martial Bill passed through committee.—Sir J. GRAHAM moved the appointment of a select committee to inquire into the operation and administration of the laws for the relief of the poor in unions under the Act 22 George III., c. 83 (Gilbert's Act), and to report to the House their opinion, whether it is expedient that the said unions should be dissolved or maintained. After a short discussion, the motion was agreed to.—On the motion of Sir J. GRAHAM a select committee was appointed to inquire into the subject of the erection of workhouses in Ireland, and to report their opinion thereon. The House then adjourned for the Whitsun recess.

Thursday.—Mr. W. O. STANLEY gave notice that, on the 22d of June, he should move for a select committee on the 6th and 7th William IV., chap. 27, with a view to repeal so much of the Bill as related to the union of the sees of Bangor and St. Asaph.—Mr. JERVIS submitted a motion respecting the claim of Mr. Russell Chichester, as executor of a Mr. Powell, an uncompensated American Loyalist; but Sir G. CLERK opposed it, as one which would reopen many claims which had been settled 25 years ago, by the parties accepting the moiety of their demands as full compensation of the whole.—On the recommendation of Mr. HUME, the motion was allowed to be negatived without a division.—Mr. F. KELLY obtained leave to introduce his Bill providing an appeal in criminal cases.—A select committee to inquire into the operation of the Poor-law, as it regarded the Gilbert Unions, was appointed on the motion of Sir J. GRAHAM, who intimated that he has not as yet determined upon a day for proceeding with his Poor-law Amendment Bill.—Mr. HAWES obtained leave to bring in a Bill for the establishment of voluntary country asylums for the relief of destitute persons after their discharge.—On bringing up the report of the committee of supply, Mr. ROEBUCK made a long speech on the state of Canada, with the intent, he said, of showing that the Government had mistaken their position, and that, if they did not alter the policy which they had pursued for the last six months, the result would be early and inevitable separation of the colony from this country.—Lord STANLEY, on the part of the Government, expressed their entire approval of Sir C. Metcalfe's conduct, especially on the two points which had been brought forward by the Executive Council as the grounds of complaint against him.—Mr. C. BULLER, Lord J. RUSSELL, and Sir R. PEEL defended the conduct of Sir C. Metcalfe, and condemned the presumption of the Executive Council.—The report of the committee of supply was then received.—The Stamp Duties and the Assaults (Ireland) Bills were read a third time, and passed. The Slave-trade Treaties Bill passed through committee. The New South Wales, &c., Government Bill and the Customs Duties (Isle of Man) Bill were read a second time.

Friday.—The Hon. Mr. Bouverie took the oaths and his seat for the Kilmarnock Burghs.—A great number of petitions were presented against the Dissenters' Chapels Bill, and some few in favour of the measure. Sir J. Y. BULLER presented 17 petitions from the county of Devon, praying the House not to withdraw the present protection afforded to British agriculture. Lord RENDLESHAM presented 13 similar petitions from the county of Suffolk. Mr. CHRISTOPHER presented several petitions on the same subject from Lincolnshire. Similar petitions were also presented by Sir W. W. WYNN from Montgomeryshire, and other Members from various parts of the country.—The Vinegar and Glass Duties Bill went through committee.—The order of the day for going into a committee of supply was read, and postponed until Monday.—The Roman Catholic Clergy Grants and Conveyances (Ireland) Bill was read a second time, and ordered to be committed.—The order of the day having been read for going into committee on the Ecclesiastical Courts Bill, Mr. T. DUNCOMBE moved that it be an instruction to the committee to abolish all Ecclesiastical Courts, and to transfer the jurisdiction of those courts to civil tribunals. The Hon. Member at considerable length contended that it was absolutely necessary to abolish all the courts in Doctors' Commons. They were an intolerable nuisance; they exacted large fees and did no good.—Mr. HUME seconded the motion. In Scotland the Ecclesiastical Courts had been swept away, and no injury or disadvantage had taken place. He therefore cordially seconded the motion.—Dr. NICHOLL was of opinion that the objection of the Hon. Member for Finsbury ought to have been taken on the second reading, when the principle of the bill was discussed, and not on the motion for going into committee. (Left sitting.)

CITY.

Money Market, Friday.—Consols closed at 99⅛. Red. Three per Cents. 98⅞. Three-and-half per Cents. 101¾. New Three-and-half 102¾. Bank Stock, 199½ to 200. Exchequer Bills, 70 to 72, premium.

GAZETTE OF THE WEEK.—BANKRUPTS.—E. G. FRIGHT, 1, Adam-street, Adelphi, Westminster, publisher—E. LOUIS, 27, Gerard street, Soho wholesale perfumer—E. OXLEY, jun., King's Lynn, Norfolk, hatter—THOS. BRAND, Stamford-street, Blackfriars, livery-stable keeper—J. SISON, Brighton, dealer in toys—J. BREWICK, Windhill, Yorkshire, worsted stuff manufacturer—T. KEARSLEY and T. WATT, Runcorn, Cheshire, bone merchants—W. MONK, jun., Nottingham, currier—J. BARNARD, Cheltenham, Gloucestershire, clothes-dealer—B. LAND, Hertfordshire, victualler—WM. DETHICK, Temple street, Whitefriars, lime-merchant—H. R. HARRADEN, Cambridge, printseller—Q. B. V. J. ANNICHINI, Gracechurch-street, merchant—J. W. MARDALL, Sussex, insurance broker—E. TYNDALE, Ross, Herefordshire, wine and spirit merchant—J. MITCHELL, Nottingham, fellmonger—T. NEWTON, Holbeach, Lincolnshire, cattle-dealer—R. BAXTER, Sheffield, merchant—F. L. HOMER, Manchester, merchant—T. BESCH, Newcastle-under-Lyme, grocer—W. LYNN, Liverpool, hotel-keeper—J. and S. Owen, Sheffield, merchants.

Metropolis and its Vicinity.

The Whitsun Holidays.—There has not been such a cold Whit-Sunday as the last for many years. The morning was cloudy and bleak; as the day advanced there was a stiff breeze from the north, and but for a few intervals of sunshine in the middle of the day, it was more like a February day than the latter end of May. However, the inhabitants of the metropolis were early on the move, and the steam-boat wharfs and railway stations were thronged with people seeking a few hours' recreation in the country. On Monday the holiday folks mustered in still greater numbers, and the steamers were crowded to excess. The number of persons landed at Greenwich exceeded 40,000, and no less than 30,000 were conveyed up and down the Greenwich railway during the day. In consequence of the competition in the Gravesend trade, and the low fare by railway and steam-boat, the concourse of Londoners who besieged the town on Sunday and Monday was beyond all former precedent. The fare direct by steam-boat from London-bridge is only 8*d.*, and the same fare only is charged by the Blackwall railway and the steamers from Brunswick pier. The desire to make a trip to Gravesend at so cheap a rate was so great on Monday, that the steamers were more crowded than those running between London and Greenwich, and the trains on the Blackwall railway frequently consisted of carriages, each containing 70 or 80 persons. The river steamers on Sunday alone carried upwards of 200,000 passengers. The railways came in for a fair share of the Whitsun traffic; and the morning trains on the South Western, Dover, Brighton, and Eastern Counties lines, carried down about 5000 persons to Southampton, Dover, Brighton, Tunbridge, Brentwood, Chelmsford, Colchester, Waltham, Hertford, Bishop's Stortford, and other places on those lines. One train on the Dover line brought up 600 passengers, and was drawn by four engines; and another going down was a quarter of a mile in length. The free exhibitions on shore were equally objects of attraction. On Monday the National Gallery was visited by 16,350 persons, and the British Museum by about 22,000; while St. Paul's, Westminster Abbey, and other places where money is taken, were comparatively deserted.

The New Royal Exchange.—This great commercial edifice is rapidly being finished. The roof of the portico of the southern entrance, in Cornhill, has been neatly inlaid with variegated stones, and the interior walks for the merchants are now completed. A moving scaffold has been erected in front of the grand portico, and workmen are busily engaged in putting up the sculpture which will decorate the chief entrance. The area in front of the building, where the old Sun Fire-office once stood, is now filling up with cement, and a light wood work has been placed on the site where the equestrian statue of the Duke of Wellington, by Chantrey, is to be inaugurated on the 18th of June. On Tuesday there were twenty blocks of stone, 79 feet square each, being the largest yet cut, placed as pavement round the pedestal. The clock of the Exchange is making by Mr. Dent, the chronometer-maker in the Strand, and is nearly completed. The original intention of having the same number of bells as before the fire has been abandoned, and the number increased from 8 to 15, which will give 3 octaves. They have been cast by Messrs. Mears, the bell-founders in Whitechapel, and are almost ready for hanging in the tower. The largest weighs 22 cwt., and the smallest 5 cwt., the whole set weighing 7 tons. As yet the whole of the tunes have not been agreed upon, the only ones decided on being "God Save the Queen," "Rule Britannia," and an ancient madrigal. The barrel for the chimes is completed, and appears to be an astonishing piece of mechanism; it contains upwards of 7000 holes. The clock and chime works will be securely protected in a separate and well-fitted apartment in the tower, and not exposed, as is generally the case in the metropolitan steeples, to the inclemency of the weather. The pendulum weighs 4 cwt., and is 16 feet in length, each vibration being two seconds. The ceremony of opening the Exchange was originally fixed by the Gresham Committee to take place in the course of July, and, although no decisive promise was made, there was little doubt that Her Majesty and Prince Albert would honour the city by opening it in person. Her Majesty's accouchement, however, which is likely to occur about the same period, precludes the hope of Her Majesty's presence at so early a date, in consequence of which the ceremony will probably be deferred until September.

Projected Inclosure of Hampstead Heath.—On Friday a numerous meeting of the copyholders and resident gentry of Hampstead took place at the parochial committee rooms, for the purpose of considering the provisions of a bill recently introduced into Parliament for the purpose of enabling Sir T. M. Wilson, the lord of the manor, to effect the sale of certain land, the result of which would be the destruction and inclosure of Hampstead-heath. Mr. S. Hoare, the banker, presided and stated that the meeting had been convened for the purpose of considering another attempt, on the part of the lord of the manor, Sir T. M. Wilson, to effect the inclosure of Hampstead-heath. He need not dwell for a moment upon the injury such a bill, if it were to pass, would inflict on themselves as copyholders on the manor, or the great injury it would also inflict upon the public. The bill now introduced into Parliament, although different in form, had precisely the same object in view as the three former bills which had been brought before Parliament, and which had been so successfully resisted by the copyholders of Hampstead. What was contemplated by the lord of the manor by the present bill, was to obtain power to effect a sale of certain portions of land in various parts of Hampstead-heath. Now, if this were permitted, no one could doubt for a moment, that the beauties of the heath would be destroyed, and the copyholds on the manor be considerably depreciated in value. It was therefore desirable that steps should be taken to oppose this measure, and it remained for the meeting to decide on what would be the most effectual means. Mr. W. M. Jones said that the bill introduced into Parliament last session was to enable the lord of the manor to let his land on building leases. Now what was the fact? In order to protect the copyholders and their rights, for which they had paid, there was a restriction in the will of the late Sir Thomas Wilson against letting the land on building leases. Notwithstanding this was the case, the present lord of the manor had sought to get powers under an act of Parliament last year to do so, and the bill was withdrawn in consequence of the determined opposition got up against it on the part of the copyholders, on the very day it was appointed for a second reading. If power was given by Parliament to enable the lord of the manor to effect a sale of certain common or waste land on Hampstead-heath, what was there to prevent the land from being used after the sale had been effected for building purposes? One of the former bills also included the letting or sale of certain portions of the Sussex property; but the present bill was solely confined to the manor of Hampstead. This attempt was a breach of faith on the part of the present lord of the manor with the copyholders, who were protected by his father's will from any interruption of the views which at present existed with respect to the situation of each of their copyholds. Under these circumstances he hoped that they should not only be unanimous themselves, but be assisted by the public in opposing a bill fraught with so much injury. Mr. Jones concluded by moving a resolution to the effect, "That the copyholders of the manor of Hampstead, viewing the bill now before Parliament contemplating the sale of certain lands on such manor as an infringement of their rights, granted under the will of the late Sir T. M. Wilson, are determined to use every means in their power to oppose and defeat the passing of such bill."—The Rev. Mr. Burgh, in seconding the resolution, observed that from the close vicinity of Hampstead to the metropolis, and the beautiful views which were commanded from the heath in every direction, this subject was one of deep interest and importance to the public generally. The lord of the manor had made no less than three previous attempts to get bills through Parliament to effect the inclosure of Hampstead-heath; but, thanks to the energies of the copyholders, without success. He hoped that they would be equally determined in their resistance on the present occasion, and that this fourth attempt of the lord of the manor would prove equally as unsuccessful as his former bills. The resolution was carried unanimously. Several other gentlemen addressed the meeting, after which a petition to Parliament against the bill was adopted, and a committee appointed to watch and oppose the measure in every stage.

Metropolis Roads.—A meeting of the Commissioners of Metropolis Roads was held last week, for the purpose of letting by auction, for the term of one year, from the 1st July next, the various tolls comprised in the 16 districts north of the Thames. The Earl of Lonsdale was in the chair. The room was crowded with lessees and others interested in this description of property. The following are the roads, with the prices at which they were disposed of:—The Kensington, Brentford, and Isleworth roads, sold for 15,935*l.*; Tyburn and Uxbridge roads, 8060*l.*; Highgate and Hampstead roads, 17,020*l.*; Stamford-hill, Green Lanes, and Seven Sisters' roads, 11,030*l.*; City-road, 3030*l.*; Hackney and Lee-bridge roads, 6000*l.*; Harrow roads, 1460*l.*; Kilburn and Edgeware roads, 4116*l.* The whole of the districts were let for 66,651*l.*, being only 131*l.* more than the sum asked for by the commissioners.

Mansion House.—On Saturday an entertainment was given by the Lord Mayor to the Judges and other distinguished persons. There were about 180 guests upon the occasion, including a great number of ladies. Among the company were the Lord Chief Justice of the Queen's Bench, the Lord Chief Justice of the Common Pleas, the Lord Chief Baron, Mr. Justice Patteson, Mr. Justice Coleridge, Mr. Justice Wightman, Mr. Justice Cresswell, Mr. Baron Alderson, Mr. Baron Gurney, Mr. Baron Rolfe, Mr. Bankes, M.P., Cursitor Baron; the City Members, Aldermen, &c.

Finsbury.—The Chartists of the metropolis have issued advertisements, announcing their intention to raise a national fund, for the purpose of purchasing an estate for Mr. T. Duncombe, M.P., for this borough, as a testimonial of their sense of his services to their cause, both in and and out of Parliament. It is stated by the *Sun* that Messrs. Grote, Prescott, and Co., the bankers, have put down their names for 100*l.*, as a contribution towards this fund.

St. Sepulchre's Church.—On Sunday evening, the Rev. Thomas Dale preached his farewell sermon at St. Sepulchre's, Snow-hill, after having held the Lectureship upwards of sixteen years. It is the intention of the congregation to present a piece of plate to Mr. Dale, in token of their admiration and esteem. The Lectureship vacated by Mr. Dale will, in future, be undertaken by the Rev. R. Wood, B.D., the recently appointed Vicar.

Anti-Corn-Law League.—The weekly meeting of the League took place on Wednesday, in Covent Garden Theatre; the Earl of Ducie in the Chair. His Lordship addressed the meeting at great length, and in adverting to the progress which the principles of Free Trade had made, insisted that there could be no doubt that the object of the League would be achieved in a very few years. His Lordship was loudly cheered in the course of his address, and was followed by Col. Thompson, Mr. E. Holland, a landed proprietor of Worcestershire, Mr Cobden, and Mr. Bright.

The Amended Poor-Law Bill.—On Saturday the Marylebone vestry assembled at the Court-house, for the purpose of receiving a report from the meeting of delegates of the metropolitan parishes, under local acts, held on Thursday last, as to the course intended to be pursued with reference to the Amended Poor-Law Bill. Amongst those present were, Earl Manvers, Lord Kenyon, Lord Montfort, Viscount Barrington, J. T. Hope, Esq, Mr. Rawlinson, the magistrate, Mr. Trittton, the banker, and a large number of the most influential vestrymen of the parish. Communications were received from the corporations of Bristol, Norwich, Hull, Oxford, Plymouth, St. Margaret's and St. John's, Westminster, and other places, under the operation of local acts, denouncing the contemplated interference

with the management of their local affairs by the Amended Poor-Law Bill introduced by Sir J. Graham, and offering to co-operate with Marylebone in a combined and systematic opposition to the said Bill. Mr. G. Daniell, as chairman of the meeting of the metropolitan delegates, representing the parishes of St. George's, Hanover-square; St. James's, Westminster; St. Marylebone; St. Pancras; St. Mary, Islington; St. Mary, Newington; St. Luke, Middlesex; St. Leonard, Shoreditch; and St. James's, Clerkenwell—brought up the report from that meeting, which was adopted unanimously. This report recommended that a petition be presented to Parliament from each of the parishes assembled, and that a deputation, consisting of the Parliamentary representatives of metropolitan boroughs containing parishes under local acts, together with members of representative boards of vestry and guardians, be appointed to wait upon Sir J. Graham, with a view to obtain the exemption of all parishes governed by local acts from the operations of the Bill, and to take such other measures as they may deem expedient to prevent its objectionable clauses being carried into a law. Several gentlemen addressed the meeting, and a petition founded on the report was adopted unanimously.

Anniversary of the Charity School Children.—Great preparations have been making for the last fortnight in St. Paul's Cathedral, by putting up benches for the anniversary festival of the Charity Children of the different parishes in the city, and within the bills of mortality, which amount to upwards of 30,000 children of both sexes. The rehearsal took place on Tuesday, and considering the unpropitious state of the weather was very fully attended. The festival took place on Thursday, before the Lord Mayor, the Sheriffs, Aldermen, and the other city authorities, and was very fully attended. The sermon was preached by the Bishop of St. David's.

Dissenters' Chapels Bill.—On Wednesday a numerous meeting of members of the Established Church, Presbyterians, Independents, Wesleyan Methodists, Baptists, and other orthodox dissenters, took place in Exeter-hall, for the purpose of adopting such measures as might be considered necessary to prevent the enactment of the Dissenters' Chapels Bill recently introduced into Parliament by the Lord Chancellor, and now awaiting its second reading in the House of Commons. The Right Hon. Fox Maule presided, in the absence of the Earl of Mountcashel. The hall was crowded with clergymen and gentlemen of various religious denominations, including many members of Parliament. Resolutions were proposed and carried condemnatory of the Bill, and pledging the meeting to merge all minor differences, and to unite in protesting before Parliament and the country against the passing of a measure so dishonourable to the Legislature, and so pregnant with danger to the cause of religious truth; and that a petition, founded on the resolution, be prepared, and signed by the chairman on behalf of the meeting, to be presented to the House of Commons by Sir Thomas Wilde. The meeting was addressed by many of the reverend gentlemen on the platform, in support of the resolutions, several of whom commented in strong terms upon the unnatural union of Roman Catholics and Socinians in support of the Bill, which could only be looked upon as a sinister attempt on the part of the Roman Catholics to overturn the Protestant church, and create one common scramble for church property. At the close of the meeting a collection was made to defray the expenses incurred.

British and Foreign Unitarian Association.—The 19th Anniversary Meeting of the members of the above Association took place yesterday morning at the Unitarian Chapel in Essex-street. The Rev. W. Gaskell delivered the annual sermon, and at the conclusion of the service the business of the meeting commenced. Mr. Thomas Gibson then took the chair, and addressed the meeting upon the state of the Unitarians, and the New Dissenters' Chapels Bill brought into Parliament for their relief. The annual reports having been adopted, Mr. Martin moved a resolution expressive of thanks to Ministers for the introduction of the Dissenters' Chapels Bill. The resolution was seconded by Mr. R. Taylor, and carried unanimously. The meeting was afterwards addressed by several other gentlemen, chiefly in reference to the opposition offered to the Bill above mentioned, after which the meeting dined together at the Crown and Anchor, Mr. A. Clarke, of the Isle of Wight, in the chair. Several speeches were delivered censuring the opposition made by other classes of Dissenters to the Bill, and advising the adoption of energetic means to secure its being passed by the House of Commons.

The Caledonian Ball.—The Annual Fancy Dress Ball, the proceeds arising from which are appropriated for the benefit of the Scottish Hospital and the Caledonian Asylum, took place on Tuesday, at Almack's, and was in every respect as brilliant, if not quite so crowded, as those of previous seasons. The demand for vouchers had exceeded in number those of last year, so that the charitable object for which the ball was given could not have suffered by the non-attendance of many personages of rank holding tickets. At least 700 persons of rank and fashion were present. On this occasion the rule that no gentleman could positively be admitted "unless in the Highland garb, uniform, full court, or fancy dress," was strictly enforced, and it is said that there was only a single instance of rejection.

Supposed Murder at Wimbledon.—On Wednesday morning the village of Wimbledon was thrown into a state of excitement by the discovery of a supposed murder. A woman, named Charlotte Hall, the wife of a plasterer, was found dead in bed in her house in Church-street, Wimbledon, and from the appearances presented by the body, there was reason to fear that she met her death unnaturally, recourse having been had to strangulation. The husband of the deceased absconded; and at the inquest evidence was adduced to show that he lived on bad terms with deceased, and that cries of murder had been heard in the cottage during the night. The medical men stated that she might have died of apoplexy, or have been suffocated with a pillow; and the Jury, to the surprise of the neighbourhood, returned a verdict of "Natural Death."

Newgate.—On Monday morning at 8 o'clock, Wm. Crouch suffered the extreme penalty of the law in front of Newgate, having been convicted at the last sessions of the Central Criminal Court of the murder of his wife. He is said to have conducted himself with propriety since his conviction, repeatedly acknowledging the justice of his sentence. About 10,000 persons assembled to witness the execution.

Accidents.—On Wednesday afternoon the Duke of Beaufort was thrown from his horse in Hyde Park, after taking a canter in Rotten-row. The horse shied at some men who were carrying a wounded man on a shutter to St. George's Hospital, and bolted through the Park Gates. His Grace fell to the ground with some violence. The bulletin issued yesterday states that, although his Grace is still occasionally in great pain, no serious consequences are apprehended from his accident.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending May 18.—West Districts, 149; Northern, 141; Central, 166; Eastern, 178; Southern, 228; Total, 862. Weekly average for the last five years, 946.

Provincial News.

Bury St. Edmund's.—Incendiarism in Suffolk continues unchecked by any of the means hitherto devised by the local authorities. Associations have now been formed in different parts of the county for the protection of agricultural and other property against incendiarism, and on Saturday the Lord Lieutenant (Earl Stradbroke), Earl Jermyn, Colonel Rushbroke, Mr. Waddington, and several other magistrates assembled in this town, when a long and animated discussion of the subject took place. The result of the deliberation has not transpired, but it is understood that a full meeting of the county magistrates, landowners, and clergy, will be shortly convened, at which various propositions are to be submitted for consideration. This step is the more necessary as threatening letters have been recently sent to some landowners and tenant-farmers. Sir T. G. Cullum, of Hardwicke, received through the post on Saturday one of these missives, in the following terms:—"Barrett Steward,—I have takin the leberty to wright to you to say, that we have not forgot Sir T. Cullum, not yet to have a —— good fire—we shall come soon. Sir T. Cullum may expect before harvest to have all his farms destroyed by fire. (Signed) GREENWOOD STEWARD." The gentleman thus menaced is admitted to be one of the most liberal landlords and paymasters in the county. Among the fires reported since our last are the following:—On Sunday morning during divine service, at Abbotts-hall, in the neighbourhood of Stowmarket, a stack of hay and a stack of beans were consumed. On Friday night at Assington, near Cornard, the extensive agricultural buildings of Mr. Norton, and several adjacent cottages, the whole covering a space of ground not less than a quarter of a mile in length, were totally consumed. The damage is estimated at 5000*l.* On Saturday night at Toft Monks, near Beccles, the farmhouse of Mr. Holt, with the barns, out-buildings, and straw stacks were destroyed. On Monday at Kesgrave-heath, the property of Mr. R. N. Shaw, a county magistrate, an attempt was made to fire the premises in open day, but it was discovered in time to subdue the flames before much damage had been done. An investigation has taken place before the magistrates of the Bildeston district relative to a fire which took place on the premises of Mr. Cooper, of Naughton. In this case the party accused is a child 11 years old, who confessed having set the barn on fire, and was committed for trial.

Eton.—The triennial festival of "Eton Montem" was celebrated on Tuesday with the usual festivities. This singular ceremony is supposed to have been coeval with the college, when the monks walked to Salt-hill in procession, and sold consecrated salt to the people. When Eton College became a public school, the procession, "ad montem," was still retained; and although considerable alterations were made in the form and order of the procession, yet with monks and scholars the principle of levying money appears to have been the same. The salt-bearers of Tuesday, in their costly and gaudy attire, stopped all the carriages, and assisted in levying a salt tax for the benefit of the Captain of the School. Even the humbler pedestrians were forced to contribute their mite, for which they received a receipt in full in the form of a small blue ticket, on which was inscribed "*Pro more et monte.*" This ticket, being stuck on the hat, the bearer was subjected to no further molestation from these juvenile tax-gatherers. The Montem of Tuesday exceeded many of its predecessors in the splendour and the gorgeousness of the costumes. Prince Albert honoured the ceremony by his presence, and a large number of visitors, including many noblemen and gentlemen educated at Eton, were among the guests. On the arrival of the Prince, the boys formed in procession, headed by the Mareschal (Helm), attended by ten pages in Venetian costumes of blue velvet, with crimson cloaks embroidered with gold, followed by the Captain of the School (Drake), attended by ten pages in Robin Hood costumes, with bows and arrows. The sergeant-major, pages, polemen, and corporals followed in fancy costumes of great variety and elegance. Before proceeding to Salt-hill, the procession passed under the window of the election chamber, and cheered the Prince as they passed round the quadrangle, and the Ensign performed the ceremony of flourishing the flag. They then proceeded in procession to Salt-hill, where the dust was whirled about in such clouds, that every one looked almost as dusty as at Epsom. On arriving at Salt-hill, the black mail was levied with unwearied perseverance, and every person who could not show a blue receipt was placed under contribution by the juvenile marauders. The flag was again flourished from the top of the hill, and the procession returned to Eton. Prince Albert and his suite remained on the ground about two hours. On the return of the students to the College, they partook of a dinner under the spacious tents of Tippoo Saib, &c., on the Fellows' Eyot, whilst the bands were playing in the fields and on the Eyots to a large and fashionable company. The Head-Master and Provost gave an entertainment at the College, to a large party of visitors. At five o'clock the bags containing the "salt" were taken to the Head Master's table, and counted out while the guests were present. The collection amounted to 1160*l.*, including 100*l.* from the Queen and 30*l.* from Prince Albert. Last Montem it amounted to 1233*l.* 18*s.* 10*d.*

Guernsey.—Since our last notice of the disputes between Gen. Napier and the civil authorities of this island, additional reinforcements of troops have been sent over from Portsmouth and the Isle of Wight, to the great surprise of the inhabitants. About 600 men were landed from the transports and steamers last week.

Keswick.—On Sunday afternoon four respectable inhabitants of Keswick took a sail on Derwentwater Lake, to Lodore, in a pleasure-boat with sails. On their return down the lake from Lodore, about a mile distant from that place, the wind veered, and blew in sudden gusts. The boat became unmanageable, and all the sails being up, it was almost instantly swamped, and sunk before the party were able to lower or shift the sails, and three of them were drowned. Captain Peters, of Barrow-house, who saw the accident from his windows, immediately ordered out his own boat, and rowed towards the place where the sail-boat went down, and in the vicinity of the spot came up to the fourth person, and picked him up. The three drowned were—Mr. Dixon, of Keswick, draper; Mr. Thornton, chandler; and Mr. Isaac Banks, gardener to Mrs. Hudson, of the Royal-Oak inn.

Liverpool.—A case apparently similar to that of Mary Furley, which has occupied so much attention in the metropolis, has just occurred near Liverpool. On Saturday night, a male child, about ten months old, was taken out of the canal, near the bridge at Bootle. When first taken out he showed signs of life, but soon died. He was very respectably dressed. The canal was afterwards dragged, and the body of a female, supposed to be the mother of the child, was found. She was delicately formed, apparently 25 years of age, and was respectably attired. A gold ring was found on her finger; and she was supposed to be from Liverpool. She had been seen nursing the child on some steps near the canal bridge in the early part of the evening, but whether she threw herself and the child into the water, or fell in by accident, is at present uncertain.

Manchester.—A meeting of delegates was held in this town last week, at which it was resolved to continue the agitation in favour of a ten-hours Factory Bill. Among other resolutions one was passed expressing "the opinion of this meeting that the defeat of the ten-hours Bill on Monday, May 13, was not a decision against the principle of limiting the hours of labour in factories to ten hours a day, but a decision forced upon Parliament by the threat of the Ministers to resign, and that therefore we are resolved, regardless of the political opinions of Government, to do all in our power to oppose any Ministry that refuses to protect children and young persons from being worked more than ten hours a day."

Nottingham.—After several sittings, the coroner's jury, impanelled in the case of the supposed murder in this neighbourhood, noticed in our last, have returned a verdict of "Wilful murder against the prisoner William Saville," a verdict which was received with evident satisfaction by an extremely crowded audience. The coroner committed the prisoner for trial at the next assizes.

Stafford.—The local papers mention as a proof of the effects produced by a severe sentence, that an Irish girl aged 17, who had borne a good character, was lately tried at Stafford for having stolen a gown and petticoat, and sentenced to seven years' transportation. It is now believed that she merely took the goods to wear on some particular occasion, without any intention of keeping them. She heard the judgment and remained stupified; in 24 hours she was a lunatic, and is now in the infirmary with no hopes of recovery. She was a remarkably handsome girl; but from the period of her sentence, her health visibly declined, and her hair actually turned gray.

Wakefield.—On Monday week about one thousand colliers paraded through the streets of this town in procession. They sung hymns as they marched, and conducted themselves in the most orderly manner. The differences existing between the employers and the men have not yet been arranged, and the strike continues with the great bulk of the colliers of this district.

Uxbridge.—At the Uxbridge Petty Sessions last week Mr. David Bassett, one of the constables of the township, was fined 40*s.* in each of eight cases—being 16*l.* in all—for refusing, as he said, on conscientious grounds, to serve distress warrants for church-rates, upon members of the Society of Friends, he himself being of that persuasion. The money was immediately paid.

Weymouth.—The postmaster at Weymouth has received an official notice, acquainting him that the packet station for the Channel Islands will be removed to Southampton early in June. It is expected that the most extensive accommodation will be afforded for the transmission of correspondence to and from this country and the Channel Islands, in consequence of the alteration. The old Weymouth packets will be immediately applied by Government for other purposes.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1477*l.*; Birmingham and Gloucester, 2147*l.*; Eastern Counties, 4318*l.*; Edinburgh and Glasgow, 2180*l.*; Great Western, 15,407*l.*; Grand Junction, 7914*l.*; Glasgow, Paisley, and Ayr, 1553*l.*; Great North of England, 1449*l.*; London and Birmingham, 17,240*l.*; South-Western, 6469*l.*; Blackwall, 966*l.*; Greenwich, 799*l.*; Brighton, 3667*l.*; Croydon, 412*l.*; Liverpool and Manchester, 4790*l.*; Manchester, Leeds, and Hull, associated, 5889*l.*; Midland Counties, 2738*l.*; Manchester and Birmingham, 3033*l.*; North Midland, 4308*l.*; Newcastle and Carlisle, 1522*l.*; South-Eastern and Dover, 4069*l.*; Sheffield and Manchester, 601*l.*; York and North Midland, 1627*l.*

IRELAND.

THE STATE TRIALS.—*New Trial Motion.*—On Friday morning the Court of Queen's Bench pronounced judgment on the motion for a new trial. Mr. Justice PERRIN first delivered his judgment. He stated his belief that the objections raised by the traversers in regard to the deficiency of proof that the act was done in the county of the city of Dublin, in regard to the name of Mr. Rigby, the extension of the trial beyond the usual term, the permission given to the jurors to go to their own homes on each day of the trial, the alleged fraudulent tampering with the jury list, and the admission of illegal evidence in the shape of a printed document circulated at Mullaghmast, were all untenable. He coincided in the doctrines of conspiracy laid down by the Lord Chief Justice, but he had doubts how far the newspaper evidence ought to have been admitted with regard to Mr. O'Connell. It did not appear to him, that the rule about the acts of co-conspirators being evidence against each other was applicable here; in an indictment for speaking, it would not have been evidence; upon this ground it appeared to him that they had misdirected the jury in taking those acts as evidence of acts done by Mr. O'Connell at Tara and Mallow. He could not bring his mind to think or induce himself to say that the newspaper reports of speeches should have been used against Mr. O'Connell. It had been said that Mr. O'Connell referred to the newspapers, but there was nothing from that to infer that he admitted the accuracy of their reports; but it had been further said that there was abundant proof besides these newspaper documents to connect the traversers with a conspiracy—such as the speeches at Clifden and Mullaghmast. For his part he thought there was ample evidence, independent of the objectionable parts, to warrant and sustain the verdict; but the Court could not take upon themselves to say whether the jury would have thought this also—they could not pretend to assert that if that evidence, which he now considered was clearly inadmissible, had been withheld, the jury would have come to the same conclusion; and it appeared to him that, as against Mr. O'Connell, the evidence regarding speeches alleged to have been spoken by him at certain places was improperly left to the Jury. He need not go through the general objections further, except as regarded the case of the Rev. Mr. Tierney. It was insisted on his behalf that no evidence was given to prove his knowledge of the acts of the other traversers previous to his having joined the Association, or of his having known anything of the speeches said to be delivered at Longford, at Tara, and at Mullaghmast. The speech which was the only evidence of conspiracy against that traverser, was one no doubt of a highly reprehensible character; it was rash, and such as ought not to have been expected from a gentleman of his profession and calling, but he did not think that it was sufficiently put to the jury as to the knowledge of Mr. Tierney of the previous acts of Mr. O'Connell and the other traversers. He thought this part of the case had been left on too loose and vague grounds, and, for the reasons he had stated, he thought the verdict as regarded Mr. Tierney ought to be set aside.

Mr. Justice CRAMPTON next delivered judgment. He concurred with Justice Perrin in disallowing the objections put forward by counsel for the traversers on the first four grounds, namely, the objection to the juror Rigby, the allegation of fraud on the construction of the jury panel, the separation of the jurors, and the venue question; and then proceeded to consider the case as regarded Mr. Duffy and the Rev. Mr. Tierney. As to Mr. Duffy, he considered the objection untenable, but he concurred with Mr. Justice Perrin in regard to Mr. Tierney. The speech spoken by that gentleman was of a very violent and inflammatory nature; it proved him to be a very ardent, and zealous, and, perhaps, indiscreet Repealer; it showed him to be a great admirer of the head of the movement, that he approved of the proceedings of the Association in the course of the year 1843, and that he was aware of the effects produced by the monster meetings—effects likely to excite hatred in the great mass of the people towards those whom he called the Saxon race. He did not mean to say that there was not evidence against Mr. Tierney of a previous knowledge of the existence of the conspiracy; but, in his opinion, it was of a slight nature. Indeed, he might say, that he had expected the jury would acquit him. As the matter then stood, he was not quite satisfied that justice had been done to this particular traverser; and unless there could be some means found for relieving him from the pressure of the verdict, so far as Mr. Tierney was concerned, he was disposed to agree in the opinion of Mr. Justice Perrin. However inconvenient and injurious a new trial might be, still, if there was no other mode of taking away from Mr. Tierney the effect of the verdict, he could not rest satisfied in his conscience without affording him the advantage of sending his case before another jury. The learned judge proceeded to notice the other grounds of objection taken to the charge, which he said was not alone that of the Chief Justice, but of all the members of the Court; and it was only necessary to read it over with common sense and fairness to see that it was of a perfectly impartial and just character. His Lordship concluded by stating that upon the whole of the case, he was of opinion that the verdict should not be set aside except as regarded the Rev. Mr. Tierney, who, he thought, was entitled to a new trial for the reasons he had stated. If he could not be separated from the other traversers, and if the verdict could not be set aside as against him without being also set aside against the others, then his opinion was, that in order to afford Mr. Tierney the benefit of what he believed him to be entitled to, there should be a new trial for the whole of the traversers.

Mr. Justice BURTON then expressed his concurrence with the preceding judges in regard to the jury list, the venue, and the admission of the Mullaghmast ballad. On the admission in evidence of different newspapers, he agreed with his brother Crampton, and differed from his brother Perrin. He was satisfied that this evidence was properly received against the traversers. Having expressed dissent from the opinions formed by Judges Crampton and Perrin respecting Mr. Tierney's case, and stated his strong disinclination to disturb a verdict arrived at after so much deliberation, he concluded by reading a compendium of the reasons which had influenced him in refusing the motion for a new trial, as regarded all the traversers, and in deciding that they had been properly found guilty upon all the issues.

The CHIEF JUSTICE said, that it would, he presumed, have been observed by the bar, and others who had attended the discussion of that motion, that he had, as far as possible, abstained from all interference in the case. He had hitherto made neither observation nor comment, preferring from motives of delicacy, and upon personal grounds, to leave to his brethren upon the bench the consideration or the correction of any imputed error or mistake into which he might have fallen in the charge delivered to the jury, as the organ and the head of the court. If any error or mistake had been committed it was fit that it should be corrected; and if the parties were entitled to have it, no one ought to be, and he trusted no one would be, more happy than he would to have his errors or mistakes rectified and justice done according to right. After referring to the points on which all the Judges agreed, his Lordship proceeded to the question relating to the reception of evidence that was contended to be inadmissible. This was especially a very material question. Now, in the first place, he had very great doubts as to the truth of the statement, that it was not brought home personally to the traversers: on the contrary, it was his opinion that it had been most satisfactorily done so. The document contended to have been illegally admitted was what had been called a ballad. It was no ballad, nor anything like a ballad. It purported on the face of it to be a history of certain pretended scenes of horror enacted at Mullaghmast. Now, let them look at the nature of the meeting held there. It had been convened by Mr. O'Connell and the Repeal Association, and under their authority the document in question had been published and extensively circulated throughout the meeting. The next topic was the reception of the newspapers. Brothers Crampton and Burton had expressed their opinion that they were evidence, not only against Messrs. Barrett and Duffy, but all the traversers. He agreed with them both in that opinion, and would express his grounds of concurrence. It was perfectly plain that the publication of seditious and inflammatory documents was an illegal act, and done in the furtherance of common design; it was not in the nature of a confession, as the letter in Hardy's case, nor of a narrative; and the publication by Barrett was a material act done by him in the furtherance of a common and criminal purpose—and that question, like all others, was left to the jury. This publication being of that nature, it was by every law laid down on the subject clearly admissible against Mr. O'Connell. He did not mean to say it was conclusive evidence against the traversers. Mr. O'Connell might have brought evidence that he never attended the meeting or made a speech, or one of that description; but he had brought forward no such proof, nor made any affidavit to that effect. Now he held it as a principle that an objection must be made at the trial, and in a tangible form, because additional evidence might then be given, or in the case of a charge, the judge might retract, qualify, or explain, what he had said. The Chief Justice at much length adverted to the speech of Mr. O'Connell as made at the trial to show that he adopted the authority of the newspapers, and that at that period no objection was urged against the newspapers being evidence against all the traversers. He therefore utterly protested against the course now adopted, of reserving such an objection until months after the trial, and the judgment in the House of Lords, in a case already referred to, was an authority against such a course of practice. He would not go further into this case. He meant to say nothing about any observations or arguments which had been made upon the subject-matter of the charge. He might have done so perfectly consistently with the station and situation which he filled; but it was more gratifying to himself that the consideration of his conduct in delivering that charge should be left to his learned brethren, to whom it had been submitted. He would make no remarks upon the course adopted in the progress of the motion; but would only say, with regard to what had taken place in that respect, that he entirely concurred in the decision which his learned brethren had come to with regard to the nature of the charge. The Chief Justice then entered into a review of the case of the Rev. Mr. Tierney, and coincided in opinion with Judge Burton as to the verdict in his case not being disturbed. This being the case, the motion for a new trial must be refused generally.—The Attorney-General here rose and said, after what has been suggested by two Members of the Court it was not his intention to call for judgment upon the Rev. Mr. Tierney; but with respect to the other traversers he had to request that the Court would fix to-morrow for giving sentence in this case.—Judge Crampton: Do you mean to enter a *nolle prosequi* with reference to him?—The Attorney-General: I was not aware until the judgment of the Court had been given that the Court was divided upon the subject of his case, and it will be sufficient for me to state that I do not intend to call up Mr. Tierney for judgment; but, as to the precise manner in which this may be entered on the record, I have not yet decided.—Judge Crampton: As this is the course to be pursued with respect to this particular traverser, I have to observe that my opinion concurs with that of my brother Burton and the Lord Chief Justice in refusing the application of a new trial to the other traversers.—The Attorney-General: I do not mean that any judgment should be hanging over Mr. Tierney; but I must consider, with reference to the state of the record generally, in what way the proceeding should be entered.—Mr. Hatchell, Q.C., in the absence of the traversers' senior counsel, said it was their intention to move in arrest of judgment; but, as a preliminary to that, they considered it necessary to have the *postea* amended conformably to the real facts which had taken place, and a notice to that effect had been served on the crown. After some discussion the further arguments on this point were deferred till next day, and the Court adjourned.—On Saturday counsel for the traversers applied to have certain amendments made in the *postea*, by inserting thereon that the jury had been allowed to separate from day to day during the trial, and also by altering the words so as to be strictly in accordance with the findings of the jury upon the several issues sent before them. After some technical discussion the application was refused, and Sir Coleman O'Loghlen was called upon to proceed with his argument for an arrest of judgment, but he prayed for a postponement until Monday. The Attorney-General protested against further delay, but at length the Court reluctantly granted the request.

Motion for Arrest of Judgment.—On Monday Sir C. O'Loghlen opened his arguments on behalf of Mr. O'Connell in favour of an arrest of judgment, the Court having previously announced their intention not to hear more than two counsel at each side upon the motion. Sir C. O'Loghlen said the objections he intended to urge were three—first, a technical one as to the caption of the indictment; secondly, that the first five counts were bad for duplicity; and thirdly, that all the counts were too general and vague. He then at great length argued the three points, adducing numerous authorities on which he relied in support of his views. He called on the Court, if they entertained any reasonable doubt on the case, not to consign his client to a dungeon, by deciding this motion against him, for if the motion were decided against the Crown, they could, if they thought the judgment of the Court erroneous, sue out a writ of error, and then the defendants would have an opportunity of having submitted to the House of Lords the question of the challenge which one of their Lordships thought ought to have been ruled in their favour. The Learned Gentleman then argued that it was not enough that the indictment charged an attempt to bring about changes in the law by overawing the Houses of Lords and Commons, was not enough without also alleging an attempt to overawe the Queen also. He again read passages of the indictment to show the vagueness with which the charge of conspiracy was set forth. He called it unconstitutional, monstrous, and called upon their Lordships to scout it out of Court, and wound up with an impassioned appeal to the equitable as well as constitutional feelings of the Bench. Mr. Fitzgibbon, Q.C., then rose to insist on the right of more than two Counsel to be heard on this point. He was permitted by the Court (notwithstanding their decision in the morning) to re-argue the question of the number of Counsel to be heard, and at the close of his address the Judges were unanimous in giving a peremptory refusal to the application.—On Tuesday the Solicitor-General replied, and contended that most of the cases and authorities cited by Sir C. O'Loghlen were wholly inapplicable in the present instance, and could not sustain an application of so strong a nature as to arrest the judgment of the Court. The learned gentleman's speech consisted of legal arguments which it would be useless to abridge. Mr. M'Donogh, Q.C., followed on behalf of all the traversers. The Jury, he contended, had found that all the traversers were not guilty of the same conspiracy. The conspiracies of which the different defendants were found guilty were different, and had a different end in view. He therefore contended that the parties were indicted for a joint offence, and that no judgment could pass upon the record against the traversers, who were found guilty of separate parts of the charge. The question here was,

Whether in consequence of the way in which the charge is made in this indictment judgment can be pronounced against the defendants. What were the inflammatory speeches? The words to bring the Government into contempt was not charged as the object of these speeches—and thus the charge of making inflammatory and seditious speeches was left vague and objectless. At the close of the learned gentleman's address the Court adjourned.—On Wednesday the Attorney-General replied on behalf of the Crown, in a speech of two hours, adducing numerous authorities to show that the objections of the traversers' counsel were inadmissible. The learned gentleman, at the close of his argument, observed that, as it was said on the other side, that this was an indictment which ought to be scouted out of Court, he would beg the Court to recollect what it was they were solicited to establish. They were then to determine that to excite hatred and contempt of the law and constitution amongst the people, and to do all those various acts with which the defendants were charged, was perfectly legitimate and constitutional. If they should do this, they would, in a word, pronounce the doom of our present constitution—for it could not possibly survive a licence to commit such acts as these parties were charged with. The Court now proceeded to give judgment. The Chief Justice said that the other judges as well as himself "were all of opinion that there was no ground for arresting the judgment." Mr. Justice Burton "was of opinion that nothing had been brought before them which would warrant them in arresting the judgment." Mr. Justice Crampton declared that "there was no reason existing to prevent judgment being passed on this record;" and Mr. Justice Perrin "was of opinion that the judgment could not be arrested." As soon as the Court had thus decided, the Attorney-General moved that the traversers should be in attendance on the following morning to receive sentence. An intimation was then given by Mr. Moore, on behalf of the traversers, that a motion would be made for the purpose of deferring the operation of the sentence until after the decision upon the proposed writ of error. The Court then adjourned.

THE SENTENCE.—On Thursday morning one of the most extraordinary scenes that ever took place in a Court of Justice occurred upon Mr. O'Connell's appearance in Court. All parts of the Queen's Bench were crowded. All the junior members of the bar, with the exception of a few, rose upon Mr. O'Connell's entrance, and commenced cheering and clapping hands for him. Mr. O'Connell appeared to be greatly surprised, and was evidently affected by this unlooked-for compliment. He repeatedly bowed to the members of the bar, who still continued applauding him, and persevered in doing so for several minutes, despite of the repeated warnings of the crier to preserve silence. It is said to be the first time that a person called upon to receive the sentence of a Court of Law has been greeted by the plaudits and the sympathy of the members of the bar. At the time this scene occurred, none of the Judges were on the bench, nor any of the Crown or Queen's Counsel present. When the Judges assembled, the first business of the day was the discussion of the motion on the part of the traversers that the Court should fix the time for the sentence to commence at such a period as might enable the traversers to have their writ of error determined by the House of Lords. This motion was supported by Mr. Moore, Q.C., and Mr. Whiteside, Q.C. It was opposed by the Attorney-General and Solicitor-General, and the Court was unanimous in rejecting it. Upon that decision being announced, the Chief Justice said — Have you anything to move, Mr. Attorney-General? The Attorney-General—I suppose the traversers are, in pursuance of the notice served on them last night, in attendance; and I move that sentence of the Court be pronounced on them.—Mr. O'Connell, who had been on one side, speaking to his counsel, with difficulty made his way to the traversers' box, and, on his entrance, all the bar rose. He was followed by the other traversers, and when their names had been severally called over, Mr. Justice BURTON, amidst the most solemn silence, and in a very impressive manner, pronounced the SENTENCE of the Court. He described the pain the discharge of such a duty had given him, and stated the reasons which influenced the Court in pronouncing a greater amount of punishment upon Mr. O'Connell, the principal offender, than upon the other traversers. A wide distinction was necessarily drawn, and the Court felt bound to inflict the most exemplary punishment upon him for the greatly aggravated offence of which he had been, after the most mature deliberation, convicted. After expatiating at some length upon the crime of which the traversers had been found guilty, and its dangerous consequences if suffered to pass without such punishment being awarded by the Court as would prevent the repetition of such an offence, he designated the offence as a misdemeanor of the highest character, and that it was not only dangerous to the peace and constitution of the country, but he might say it had brought the people almost to the very verge of a civil war. It therefore, of necessity, must lead to severe and signal punishment. "In according that punishment," he said, "the Court feels that however great the offence has been—however dangerous to the public welfare—however necessary the punishment to be inflicted—however considering that the crime could have led, and did lead, to convulsions of the public mind, the effects of which are yet to be seen—still the Court feels that it is not to be led away either by feelings of indignation, nor by any desire to inflict punishment for punishment's sake; but that it behoved us to bring our minds free and unbiassed from external influence to the subject. A crime has been committed which calls for exemplary punishment likely to prevent the same persons from committing the same offence again, and to deter others of the same views from the perpetration of similar acts. For myself, and I may I think add all the Court—I am sure that their minds have been brought into exactly the proper state to consider the case. We are bound to award punishment of an exemplary kind; but at the same time determined not to suffer any opinion of our own as to the offence to guide us in the sentence, but strictly to examine and conclude upon the character of that offence. With these views the Court have come to the judgment now determined upon, and which I am about to pronounce." The learned Judge here paused, burst into tears, and when he was able to resume, uttered in almost inaudible tones these words:—"With respect to the principal traverser, the Court is of opinion that he must be sentenced to be imprisoned for the space of twelve calendar months, and that he is further to be fined in the sum of 2000*l.*, and bound in his own recognisances in the sum of 5000*l.*, and two sureties in 2500*l.*, to keep the peace for seven years. With respect to the other traversers, we have come to the conclusion that to each shall be allotted the same sentence; which is, that they be imprisoned for the space of nine calendar months, each of them to pay 50*l.* fine, and enter into their own recognisances of 1000*l.*, and two sureties of 500*l.*, to keep the peace for seven years." After a lapse of a few moments Mr. O'Connell rose, and leaning over the table towards the bench, thus addressed the Judges—"I beg to remind your Lordships, that I made a solemn affidavit, denying for myself and on the part of the other traversers, that I had entered into any crime of conspiracy with them; and it is now with great regret that I have to express that I am under the painful conviction that justice has not been done."—(Loud cheers here broke forth from all parts of the Court. The Judges looked around them as if utterly confounded by this outburst of popular feeling. The cheering was continued for a few minutes, and, as it was about to subside, was again renewed in obedience to the call of "One cheer more.") A consultation took place in a low tone of voice between Mr. Justice Burton and Mr. O'Connell as to the place of confinement. They are, it was understood, for Mr. O'Connell, the Richmond Penitentiary; for the other traversers the City Marshalsea, as being within the limits of the place where they were tried. At half-past four Mr. O'Connell was in the custody of the High Sheriff for the city. He was still within the walls of the court, in which there were large bodies of the police. All sides of the court, and all the approaches to it, were invested by a large multitude. The greatest excitement prevailed in all parts of Dublin, but no apprehension was entertained as to any violation of the public peace. A proclamation had been universally circulated in all parts of Dublin by order of Mr. O'Connell, and was an exhortation in the strongest language to "peace and quietness."

Dublin.—The Repeal Association held their usual weekly meeting on Monday at Conciliation-hall. It being generally understood that this would in all probability be the last occasion on which Mr. O'Connell would be present previous to the passing of the sentence, the Hall was densely crowded. When he entered the Hall, he was received with enthusiastic cheering. When the applause had subsided, he moved that Sir Samuel Bradstreet, Bart., should take the chair. After some business had been gone through, Mr. O'Connell rose, and said he had to move that an address to the people of Ireland, on the present position of the public cause, be prepared for circulation against the passing of the sentence. That sentence might, or might not, be carried into effect immediately. They intended appealing to the House of Lords, and it was only just that the execution should be deferred until the result of that appeal was known. The past, however, gave them little to hope from the leniency of the Court of Queen's Bench. In any event it was right that the people should be perfectly prepared, and not be suffered to allow their feelings to overcome their resolution to be peaceable. They would play the game of the enemy by violating the law—they should be made to understand that, and moreover that nothing would be more desirable to certain parties than an opportunity of turning out the military and police on the unarmed people. He was sure that tranquillity would be maintained. The Catholic clergy had taken up the cause: they were the best peace officers they could have. The magnificent contributions which he had that day handed in were evidence that they were heart and soul in the cause. He continued to address the meeting at considerable length. He said that Ireland was in a worse condition now than at the time of the Union—that the testimony of all travellers was, that there was more destitution in Ireland (a country so blessed by nature) than in any other on the face of the earth, and attributed all the evils of Ireland to the want of a domestic legislature. As it was the object of the prosecution at present to press matters forward, it was highly probable that in a few days they would be sent to prison; but did they go there disgraced?—had they flinched or compromised their principles?—were they less Repealers? No; but, if it were possible, they were a thousand times more in favour of repeal than they were before the prosecution had been instituted. What had their prosecutors in view? Surely not the miserable pleasure of having him in a pound, although there were some ancient dames who, he supposed, would sweeten their tea and tracts with the thought that the man who achieved emancipation was in gaol. With the blessing of God, however, they would live to come out of gaol. But he solemnly and awfully declared, for his own part, that he would not come out of it except to his grave, if any man were guilty of any violation of the law in consequence of that imprisonment. Whosoever did so doomed him to his grave. He there, in their name, promised for them that they would be tranquil, come what might; but he told them also, that if they wanted to keep him alive they should continue to agitate for Repeal. Every man who refused to be a Repealer was a nail in his coffin. So long as he lived the connexion between the two countries should be maintained, and he thought that shortening his life was not the way to lengthen the connexion. His opinion was, that if the union were not repealed in his lifetime, it would be dissevered by force, and the flag foremost in the battle would be one having inscribed on it, "The Monster Trial." He continued at considerable length to impress on his auditory the necessity which existed for peace and renewed exertion in agitating the Repeal of the union, and concluded by moving that an address embodying the topics of his speech be prepared and circulated among the people on the termination of the prosecution. Mr. W. S. O'Brien seconded the resolution, and asserted that by imprisoning O'Connell they would destroy much of the link which bound Ireland to England. He should not be convinced that they could reach that degree of fatuity until he had accompanied O'Connell to his dungeon. The rent for the week amounted to 544*l.*—Our readers cannot have forgotten the case of Mr. Egan, of Moat, who was tried in January, 1843, for purloining a parcel from the coach which contained several hundred pounds in bank-notes, the property of the National Bank of Ireland. The parcel was abstracted from the coach between Moat and Dublin. Mr. Egan was tried for the felony, and after an investigation which lasted two days was acquitted. On Monday last Daniel Forrester, the officer of the London Mansion-house, arrived in Dublin with a warrant from the Lord Mayor of London, which charged Mr. Egan with having in his possession a 100*l.* note stolen out of the parcel in question; and proceeded to Moat, where he arrested Mr. Egan on the charge. It is stated that Mr. Egan passed the note at an hotel in London, and that it has been fully identified as one of the notes stolen out of the bank parcel. Mr. Egan was taken to London on Saturday by Forrester, there to abide his trial for having the note in his possession, knowing it to have been stolen.

Nenagh.—On Saturday, John and Thomas Wade, brothers, who were found guilty last assizes of the murder of a man named Patrick Ryan, were executed in front of Nenagh gaol. A third brother, Patrick Wade, remains in gaol until next assizes, charged with being concerned in the same crime. The two criminals confessed their guilt.

Tuam.—The *Limerick Chronicle* states that the Bishop of Tuam, Dr. Plunkett, has deprived one of the absentee rectors in that diocese of his benefice, and appointed thereto the working curate, and that there are law proceedings instituted by the same prelate against four absentee benefised clergymen from the same diocese.

SCOTLAND.

Edinburgh.—The General Assembly last week had under consideration the long-pending Tolbooth church case, in which the Presbytery of Edinburgh, and the Synod had declared their opinion that Mr. Smith, the presentee to the Tolbooth Church, was not qualified to be a minister in the parish, and was unfit to edify the people. After a long discussion the Assembly reversed the decision of the inferior Church Courts, by a majority of 137 to 117, and the presentee will therefore be appointed without further trouble. The Assembly was adjourned on Monday by the Marquis of Bute, her Majesty's Commissioner, to the 14th May, 1845.

Law.

COURT OF EXCHEQUER.—(Sittings in Banco.)—*Brown* v. *Fothergill.*—Mr. W. H. Watson moved for a new inquisition in this case, on the ground that the damages assessed by the jury were excessive. It appeared from the statement of the learned counsel, that the action was one of trespass for an assault and battery, in which the plaintiff and the defendant stood in the relative position of steward and "squire," the defendant being a gentleman of large property in South Wales. From some cause a quarrel arose between these parties, which ended in the defendant dealing the plaintiff a blow over his eye with a hay-fork. For this assault the present action was brought, and there being no defence to it the defendant suffered judgment to go against him by default, whereupon a sheriff's jury was summoned to assess the damages to which the plaintiff was entitled by way of compensation for the injury sustained by him at the hands of the defendant. On that occasion several witnesses deposed to the fact of the plaintiff having suffered much serious injury from the blow, which had affected his sight and hearing, rendering it necessary for him to wear spectacles, and to submit to the annoyance of a squint. Some medical witnesses having further deposed to the permanent character of these consequences, application was made during the progress of the inquiry to the plaintiff's counsel and agent for the production and examination of their client by other medical men, in order that the jury might themselves form an opinion as to his real state and condition, which were hinted not to be of so distressing a kind as had been proclaimed by the counsel when opening his case. This request, however, though the under-sheriff expressed a strong opinion on the subject, was refused, and the case having gone to the jury they, under such circumstances, awarded the sum of 500*l.* by way of damages. This, it was now contended, was an extravagant view of the matter, and certain affidavits were produced tending to show that the plaintiff was not materially the worse for the assault, and that he had most positively refused to submit his eye to the inspection of any medical man on the part of the defendant. It was therefore urged that the defendant was entitled to have a fresh inquiry, in order that that measure of justice might be administered which had been withheld by the plaintiff and the jury in the first instance. The Court, however, was unanimously of opinion that there was no ground for interfering with the damages already assessed by a tribunal whose exclusive province it was to determine such matters. If anything could be made of the plain-

tiff's refusal to be examined or to appear before the jury, no doubt the topic had been urged by the representative of the defendant, and, as the Court had no power to order him to submit to any such examination, and they could not take upon themselves to say that the jury had not given the circumstance all the weight which it was entitled to at their hands, the application must be refused. But for that fact, the jury might perhaps have awarded the plaintiff 70 *l.* or 1000*l.*, to which sum the damages were limited by the declaration, and it might be that a second jury would give more than 500*l.*—Rule refused.

COURT OF QUEEN'S BENCH.—(Sittings in Banco.)—*Doe, on the Demise of the Marquess of Anglesey, against the Churchwardens and Overseers of Rugeley.*—This was an ejectment, which had been brought for a forfeiture in the following circumstances:—The premises which were the subject of the action, and which consisted of a house and some acres of land, had been conveyed by an ancestor of the Marquess of Anglesey to the defendants as trustees for the poor of the parish, and they covenanted that they would use the house as a workhouse for the poor, and the land for their sole use, maintenance, and support, and that they would not convert the land or house to any other use or purpose whatever. The house continued to be used according to its original destination up to May, 1840, when the poor of the parish, in consequence of an order made by the Poor Law Commissioners, were transferred to the Union at Lichfield. The land, before the order of the Commissioners, had been used as a garden, and cultivated by the poor in the house; but since that time had been let out to a tenant, and the rent had been applied in aid of the rates for the relief of the poor. In these circumstances the action was brought, upon the ground that the facts of the case constituted a breach of the covenant, and a consequent forfeiture of the estate. The question in issue being principally a matter of law, the parties agreed upon a special case, which was lately argued in this Court. Lord Denman now delivered the judgment of the Court, to the effect that the covenant was substantially performed, as neither the house nor land had been converted to any other use than that of the poor of the parish. It was true that the house was not for the present used as a workhouse, but it could be so applied at any time when it might happen to become necessary to do so. The judgment would therefore be for the defendants.

SPORTING.

THE DERBY.—The perplexities of the betting world, induced by the postponement to an indefinite period of the "deciding heat" between Orlando and Running Rein, have been increased by the death of Mr. Crockford, who had a large account on the race. His book was compared at the usual time by Mr. Edward Crockford, who declared his intention to attend for the purpose of paying and receiving, and whose right to do so was admitted by the stewards of the Jockey Club. The settling, therefore, on Monday proceeded as usual. With respect to Orlando and Running Rein, it appears that, being anxious for the sake of the settling to bring the matter to as speedy a termination as possible, Colonel Peel, on Friday last, made a proposition, through the stewards, to refer it, under the recent act of Parliament giving arbitrators the power to examine witnesses on oath, to a barrister, to be selected by the Lord Chief Justice. This proposition was forwarded by the stewards to Mr. A. Wood, who refused to accede to it. On this the stewards considered themselves absolved from any further responsibility in the affair, and a communication to that effect was forthwith made to the different parties. Colonel Peel immediately placed the matter in the hands of his solicitor, and on Saturday notice of an action at law was served on the stakeholder. In the race for the Derby, Mr. Litchwald's b. c. Leander made the running for about half a mile, when he received a kick from Running Rein on his off hind-leg, which broke between the hock and the fetlock. He was instantly pulled up, and was destroyed on the evening of his accident, and buried the same night, at Ashted, and there, but for a frolic, his remains might have reposed undisturbed until everything connected with him had passed into oblivion. On Friday, however, at a merrymaking of Scott's friends, at Leatherhead, in the evening the conversation turned upon Leander, and it was determined to "have him up." Acting upon the impulse, the necessary implements were procured, the whereabouts discovered, and in a brief space the grave was reopened, when he was found to be minus the lower jaw. As this looked rather suspicious, the head was forthwith cut off, and on Saturday submitted to Mr. Bartlett, the veterinary surgeon, of Dorking, who, after examining the upper jaw, pronounced it to be the head of a four-year-old. It appears that Mr. Mitchell, of Worthing, cut the under jaw from Leander, in the presence of several persons, not, as he states, at the request of Mr. Forth, Mr. Lichtwald's trainer, but thinking, as the horse lay, it was the youngest mouth he had ever seen, and that it would be a satisfaction to Mr. Forth to show his friends. Mr. Forth showed the missing jaw to Mr. Field, of Oxford-street, and on his declaration that it had belonged to a four-year-old, made Messrs. Weatherby acquainted with the fact. It was considered strange that so experienced a trainer, with the knowledge that for months past the age of the horse had been in question, should have been so slow in satisfying himself upon the point, and stranger still, that this very horse should have received his death-blow from Running Rein—and that the Messrs. Lichtwald should be absent. Mr. Forth has since published a statement, to the effect that, in February last, having found Leander a very superior horse, he was anxious to satisfy himself with regard to the rumours concerning his age, and for this purpose had his mouth examined by Mr. Wood, the veterinary surgeon, of Arundel, of whom he received a certificate bearing his own and his clerk's signatures, that he was only three years old. This appeared a strong point in favour of Mr. Forth; but, it was asked, "Was the horse submitted to Mr. Wood for examination the identical Leander, or an animal, professedly Leander, of the age mentioned in the certificate?" Mr. Forth has met this by an affidavit on oath, that it was the identical horse. Notwithstanding this, in a case of so much suspicion, and opposed as Mr. Wood's opinion is by those given by Messrs. Field and Bartlett, the question is likely to occupy attention for some time in the sporting world.

BIRTHS.—On the 21st ult., at Hampstead, the lady of G. W. HARRISON, Esq., of twins—21st ult., in St. James's-place, LADY E. VESEY, of a son—21st ult., Mrs. STONE, of Christ's Hospital, of a son—21st ult., at 4, South-place, Kennington-common, Mrs. F. DEVON, of a daughter—21st ult., LADY JOHN BERESFORD, of a son and heir—22d ult., at Worlingham-hall, VISCOUNTESS ACHESON, of a son—23d ult., at 56, Hunter-street, Brunswick-square, Mrs. MARDON, of a son—23d ult., at Lymington, the lady of W. T. AGAR, Esq., of Elm Lodge, of a son—23d ult., the lady of C. EWENS, Esq., of a son—24th ult., at Temple Dinsley, the lady of T. P. HALSEY, Esq., of a son, which only survived a few hours—24th ult., the lady of ROBT. HORTON, Esq., late of her Majesty's 74th Regiment, of a son—24th ult., at the Priory, Wandsworth-road, Mrs. H. HARE, of a son—24th ult., at 19, Chester-terrace, Eaton-square, the lady of the Rev. M. COWIE, of a son, who lived only a few hours—24th ult., in Abingdon-street, the lady of W. CURREY, Esq., of a son, still-born—28th ult., in Portland-place, the lady of the Hon. Lieut.-Col. WILBRAHAM, of a daughter—28th ult., in Alfred-place, the lady of J. COLLYER, Esq., of a daughter.

MARRIED.—Recently, R. INCLEDON, Esq., eldest son of the late Captain Incledon, R.N., to MARIA TATHAM, daughter of the late C. H. Tatham, Esq., architect—20th ult., at St. George's, Hanover-square, VISCOUNT MELGUND, eldest son of the Earl of Minto, to EMMA E. E. HISLOP, only daughter of the late Gen. Sir T. Hislop, Bart., G.C.B.—21st ult., at St. George's, Hano-square, the Rev. H. COCKERELL, Vicar of North Weald, Bassett, to ELIZ. F. GORDON, eldest daughter of the late W. Hesse Gordon, Esq.—21st ult., at St. Andrew's Church, Pershore, Worcestershire, Capt. H. STROUD, R.N., to MARY A. CRUSE, daughter of the late E. Cruse, Esq.—22d ult., at Millbrook Church, Southampton, H. BERNARD, Esq., of Wells, Somersetshire, to MARY HAYNES, eldest daughter of D. F. Haynes, Esq., of Ashtead, Surrey—28th ult., at St. George's, Bloomsbury-square, C. MERCER, Esq., of Ashford, Kent, to ANNE M. JEMMETT, younger daughter of the late G. E. Jemmett, Esq., of Ashford—29th ult., at St. Giles's Church, the Rev. W. P. VINCENT, M.A., eldest son of J. P. Vincent, Esq., of Lincoln's Inn-fields, to ELIZ. H. BUDD, second daughter of the Rev. H. Budd, Rector of White Roothing, Essex, and grand-daughter of the late General John Hale, of Yorkshire—29th ult., at St. George's, Bloomsbury, C. J. F. BUNBURY, Esq., eldest son of Lieut.-Gen. Sir H. E. Bunbury, of Barton-hall, in the county of Suffolk, Bt., K.C.B., to FRANCES J. HORNER, daughter of L. Horner, Esq., of Bedford-place.

DIED.—On the 21st ult, at the Hague, Holland, WILLIAM GUSTAVUS FREDERICK, tenth Earl of Athlone, aged 64—21st ult., at Axminster, Devon, after a painful illness of four months, FRANCES F. HAYMAN, youngest daughter of C. Hayman, Esq., surgeon, aged 20—22d ult., J. DOUMALL, Esq., of 18, Trevor-square, Knightsbridge, aged 63—22d ult., at Mevagissey, in the county of Cornwall, J. PEARCE, Esq., aged 86—23d ult., Mr. R. WARNER, proprietor of the Bedford-hotel, Piazza, Covent Garden, aged 48—24th ult., at Southampton, L. G. FORD, Esq., late Physician-General of the Bombay Medical Establishment, Hon. East India Company's Service—24th ult., of consumption, GEO. HICKMAN, second son of Mr. E. Hickman, of the Old Kent Road—24th ult., the Rev. J COOK, of Newton-hall, vicar of Chalton, and of Shilbottle, all in the county of Northumberland, aged 85—25th ult., at Clifton, JANE WYLDE, the beloved wife of the Rev. C. E. Wylde, widow of the late Col. W. D. Knox, of Athol-crescent, Edinburgh, and eldest daughter of the late J. Waite, Esq., of Old Burlington-street—26th ult., PENELOPE GIBSON MALLESON, only daughter of Mr. Malleson, of Claremont gardens, aged 19—26th ult., after a few days' illness, and whilst on a visit at G. Alexander's, Esq., M.D., Sussex-terrace, Hyde Park, SARAH PAGE, relict of the late W. S. PAGE, Esq., of Rochester, aged 76—27th ult., JULIET SMITH, the youngest child of R. E. Smith, Esq., of Endsleigh-street, Tavistock-square—27th ult., HENRY W. WHITBY, only surviving child of the late W. H. Whitby, Esq., of 8, Powis-place, Queen-square, Bloomsbury—28th ult., at Chelsea, MARY TEBBS, widow of the late W. Tebbs, Esq., of Doctors'-Commons, aged 68—28th ult., at the residence of H. Smith, Esq., Great Russell-street, Bloomsbury, Vice-Admiral N. THOMPSON, aged 75—29th ult., at his house in Berkeley-square, T. THORNHILL, Esq, of Fixby Hall, Yorkshire, and Riddlesworth Hall, Norfolk, aged 64.

TWENTY YEARS' LOSS of HAIR, and WONDERFUL RESTORATION. Church-street, Whitby, Oct. 19, 1844.——Gentlemen,—Of the last supply of OLDRIDGE'S BALM OF COLUMBIA every bottle was sold immediately on receipt, and I have many more bespoke, only waiting for a further supply, which I hope you will send without the least delay. Orders have poured in more than ever since the powerful effects of the Balm have been so decisively demonstrated in the cases of several credible and respectable inhabitants of the town. One instance, among others which have attracted particular attention, is the case of a gentleman who had had little or no hair for 20 years; he had tried numerous preparations in vain, and ultimately had his head shaved, and wore a wig. At my recommendation he tried the Balm; and after using it according to the directions for a short time, the young hair appeared, and he has now as fine a head of hair as any person in Whitby. Yours, &c., JOHN KILVINTON.—To Messrs. Kennaby, Brothers, 10, Westmoreland buildings, Aldersgate-st., London

OLDRIDGE'S BALM prevents the hair turning gray, produces a beautiful curl, frees it from scurf, and stops it from falling off; a few bottles generally restore it again. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. *No other prices are genuine.* Ask for OLDRIDGE'S BALM of COLUMBIA, 1, Wellington-st., Strand.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*; extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

SILVER PLATED DISH COVERS. — A. B. SAVORY and SONS, Manufacturing Silversmiths, 14, Cornhill, opposite the Bank of England, submit for choice in their Plate-rooms, many patterns of SILVER PLATED DISH COVERS, of Sheffield manufacture, from 15 to 20 guineas the set, viz.:—

Double Dome Pattern.	Size.	£	s.	d.	*The Melon Pattern.*	Size.	£	s.	d.
1 Pltd. Dish-cover,	20 in.	5	13	6	1 Pltd. Dish-cover,	20 in.	5	17	0
1 „ Dish-cover,	18 in.	4	7	6	1 „ Dish-cover,	16 in.	4	14	6
2 „ Dish-covers,	14 in.	5	12	0	2 „ Dish-covers,	14 in.	6	6	0
Per Set.....		£15	13	0	Per Set.....		£16	17	6

The above have silver handles and mountings, and silver shields for engraving the crest or coat of arms. A price current, illustrated by drawings, and containing every information relative to the purchase of silver or Sheffield plate, may be had on application, or will be sent into the country, free of postage, in answer to a paid letter.

FELIX SUMMERLY'S HOME TREASURY OF BOOKS, PICTURES, TOYS, &c.; purposed to cultivate the Affections, Fancy, Imagination, and Taste of Children.

Toys just Published:

BOX OF 10 BEST COLOURS FOR LITTLE PAINTERS, with Hints and Specimens. 6*s.* 6*d.*

TESSELATED PASTIME, with numerous Patterns. 6*s.* and above.

Books just Published:

JACK AND THE BEAN-STALK A New Edition, with 4 NEW Pictures. 3*s.* 6*d.* and 2*s.*

THE PLEASANT HISTORY OF REYNARD THE FOX, told by Everdingen's 40 Pictures. 6*s.* 6*d.*

The *Athenæum* recommends them as a Bouquet of Flowers "immortals" as the Florists would call them; for they are not subject to change, and will be fresh and fragrant at Christmas, or on New Year's Day, or at Easter, or on any other or all holiday seasons.

In preparation:

PORTFOLIO OF PICTURES, Ancient and Modern, Coloured and Plain, for Copies, 7*s.* 6*d.*

BOX OF TERRA COTTA BRICKS, Geometrically made, 10*s.* 6*d.* and upwards.

Published by JOSEPH CUNDALL, 12, Old Bond-street, London.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane-sq.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, patronised by "Her MAJESTY," H.R.H. Prince ALBERT, the Royal Family, and the several Courts of Europe. A FRAGRANT WHITE POWDER, prepared from Oriental Herbs of inestimable virtue, for strengthening, preserving, and cleansing the teeth. It eradicates the factitious formation of tartar, and by the removal of that extraneous substance lends a salutary growth and freshness to the gums. It removes from the surface of the teeth the spots of incipient decay, polishes and preserves the enamel, substituting for discolour and the aspect of impurity, the most pure and pear-like whiteness; while, from its salubrious and disinfecting qualities, it gives sweetness and perfume to the breath, bestowing at once cleanliness, and the appearance and reality of health. Price 2*s.* 9*d.* per box, duty included.

CAUTION.—To protect the public from fraud, the Hon. Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus,—A. ROWLAND and SON, 20, Hatton Garden, which is affixed to each Box. Ask for ROWLAND'S ODONTO. Sold by them, and by Perfumers and Chemists.

*** All others are SPURIOUS IMITATIONS.

WANTED, as GARDENER, an active young Man, who is willing to work himself, and is competent to undertake the care of Vines, as well as to manage Forcing in all its departments. Wages 1*l.* per week.—Application to be made to Mr. WALKER, "The Hall," Wigan. A labourer's assistance granted when necessary.

WANTED to PURCHASE, a small-sized second-hand STEPHENSON'S COPPER BOILER, complete with stand and pipes. It must be sound and in good working order. Any other Apparatus for heating a small Greenhouse with hot water would not be objected to, provided the price was moderate.—Address, with full particulars, and the lowest terms, to Zeta, care of Messrs. Decastro and Peach, 65 and 66, Piccadilly.

WANTED a steady active young Man, from 25 to 30, to assist in a Nursery and Pot department. One that has had some experience would be required. For particulars, direct to P. P., and J. C., Post-office, Aylesbury.—Wages moderate.

TO AGRICULTURISTS.

WANTED for a Respectable Youth, 18 years of age, BOARD and LODGING in the family of a Practical Farmer, where he would have an opportunity of learning the science of Agriculture. Direct to A. B., Post-office, Canterbury-place, Lambeth, Surrey.

WANTED A GARDENER AND HIS WIFE.—The Gardener must be a middle-aged man, used to the improved management of a Conservatory and Vinery—a Kitchen and Flower Garden, and Walks, all of moderate size. His wife is wanted as Cook, where the Lady is her own housekeeper. She must be a very good Cook, and be able to make and bake bread, and have lived in families of respectability in that capacity. The family is small in number, the washing is put out, and a kitchen-maid is kept. The Gardener and his wife must be without children, and be of the Church of England. The wages for the two persons, who will both live in the House, will be Forty Guineas per annum: no perquisites of any kind are allowed. The most unexceptionable references as to ability and character will be required in both instances. Letters, post paid, may be addressed to L. Z., care of Mr. Mackie, Bookseller, Greek Street, Soho, London. The situation is close to a considerable market town, about fifty miles from London.

WANT PLACES.—All Letters to be post-paid.

AS FOREMAN AND PROPAGATOR in a Nursery, a middle-aged Man, who can produce good testimonials as to Character, &c.—Direct to A. B., care of Mr. Baker, 61, Tooley-street, Borough.

AS GARDENER, or GARDENER and BAILIFF.—A respectable married Man, 28 years of age, with very little incumbrance, who perfectly understands Horticulture in all its branches. Every satisfaction can be given as to abilities, sober habits, &c., from the gentleman he is now leaving, where he has been 12 months; likewise two years' previous character, if required.—Direct to J. F., No. 2, Marson-street, Philip's-buildings, Somers Town.

AS GARDENER.—A Gentleman wishes to obtain a Situation for his Gardener, whom he is about to part with, in consequence of some alteration in his establishment. He has a practical knowledge of his business in all its branches, and can manage a few acres of Land, if required. Age 45.—Direct to E. G. Mr. Jessop, Nurseryman, Cheltenham.

AS GARDENER.—A Married Man, without incumbrance, aged 35, who has had great experience in all the branches of Forcing and Flower Gardening; can be highly recommended from the gentleman he has left. Direct, H. B., Mr. Rawlingson's Nursery, Tooting, Surrey.

AS GARDENER.—A Gentleman wishes to recommend as Gardener a very respectable steady, and intelligent man, who has lived in his service for the last two years and a half. He thoroughly understands his business in the management of Conservatory, Forcing, and all its ordinary details; he is married, with a family. His wife, a most respectable person, could assist in a Laundry, if required. Direct, if by letter, to W. B., at Mr. J. C. WHEELER'S, Nurseryman, Northgate-street, Gloucester. Personal inquiries will be answered by Messrs. CHANDLERS, Nurserymen, Vauxhall.

AS GARDENER.—A single Man, aged 39, who has lived 10 years in his last situation, where he had an extensive practice in the cultivation of the Pine, Vine, Peach, and Forcing generally; who left in consequence of the decease of his employer, and breaking up of the establishment. Can have the most undeniable reference as to character and abilities.—Direct to T. M., at Mr. CUTHILL'S, Florist, Denmark hill, Camberwell, London.

AS STEWARD of a Gentleman's Property in any part of England.—The Advertiser will be happy to transmit his testimonials, and every information, in answer to applications directed to A. B., care of C. F. Williams, Esq., Palace-gate, Exeter.

AS GAMEKEEPER, an experienced person, aged 36, who perfectly understands the rearing and breeding of all kinds of game, and the duties of the kennel, &c. Satisfactory references will be given by the Nobleman he has lately left.—Direct to J. W., Post-office, Liphook, Hants.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND is desirous of receiving TENDERS from Innkeepers, or others, to CONTRACT for any one or more of the following SUPPLIES, at the ensuing Annual Country Meeting of the Society, to be held at Southampton in July :—

I.—A Hot Dinner for 400 persons, with Dessert, and a Bottle of Port, Sherry, or Bucellas, to each person, in the Victoria Archery Rooms, Southampton, on Wednesday, the 24th July, 1844.

II.—A Cold Dinner for 1200 persons, with a Pint of Port, Sherry, or Bucellas, to each person, in the Pavilion of the Society, on the Fairfield, Southampton, on Thursday, 25th July, 1844.

III.—Refreshments suitable for 200 Ladies, in the Gallery of the Pavilion, on the same occasion.

Printed Forms of Tender will be forwarded to parties applying to the Secretary, and must be returned to him, filled up, on or before Monday, the 10th of June, to the Office of the Society, No. 12, Hanover-square, London ; the Society not binding itself to take the lowest tender.—By order of the Council,

JAMES HUDSON, Sec.

HAMPSTEAD FLORIST SOCIETY.—The First and principal Exhibition for 1844 will take place on Thursday, June 13, in the grounds of J. Jackson, Esq., near Jack Straw's Castle, Hampstead Heath. The Exhibition will open at One o'clock to Visitors. Admittance One Shilling. A Band will be in attendance. WILLIAM GOULDING, Secretary.

GARDENERS' BENEVOLENT INSTITUTION.—At a General Meeting of the Subscribers to this Institution, held on the 4th June, at the Crown and Anchor Tavern, for the purpose of Electing Four Pensioners on the Fund, the following was the result of the ballot :—

ELIZABETH COLLYER	160 votes.
SAMUEL LYWARD	150 ,,
ALEXANDER UPTON	120 ,,
JOHN WELLARD	110 ,,
JOHN BLAYLOCK	101 ,,
ROBERT CRACKNELL	77 ,,
GEORGE MARTIN	56 ,,

The Meeting then declared that Elizabeth Collyer, Samuel Lyward, Alexander Upton, and John Wellard were duly elected Pensioners of this Charity.

97, Farringdon-street. E. R. CUTLER, Secretary.

THOMAS CRIPPS respectfully offers the undermentioned NEW FUCHSIAS.

PETUNIA PUNCTATA.

W. MILLER has a few good Plants of this beautiful Flower to send out at 5*s*., post-free ; also a few strong Plants in 60 pots, at 7*s*. 6*d*. each. Blooms may be had on application.—Providence Nursery, Ramsgate, June 6, 1844.

WOODLANDS NURSERY, MARESFIELD, near UCKFIELD SUSSEX.

WILLIAM WOOD AND SON respectfully invite the attention of Amateurs and their Friends to their extensive Stock of SUPERB NEW FUCHSIAS, consisting of upwards of 100 of the finest named sorts, which they are now prepared to send out, in very strong plants hardened to the open air). A few of the most esteemed varieties are enumerated below, and will be supplied at 12s. per dozen sorts, or one plant of each for 18s. Alata, Britannia, Brockmannii, carnea, Champion, Cormackii, Defiance, Eclipse, Enchantress, Eppsii, Exoniensis, Lancii, Majesticus, Noblissima, Paragon, Robusta, Rogersiana, Stanwehana, Transparens, Victory; or 50 extra-fine varieties, including the above, for 40s. Fine varieties can also be supplied at 6s. and 5s. per dozen, when the selection is left to W. W. and Son.

Also, Strong Plants of the following SUPERB VERBENAS, at 12s. per dozen varieties, or one plant of each for 20s. Amethystina, Atrosanguinea, Barnsii, Beauty, Bishopii, Boule de Feu, Bridesmaid, Elegans (Youell's), Formosa elegans, Fortuneteller, Harlequin, Howardiana, Laconii, Lilacina, Longiflora, Minstrel Boy, Prince of Wales (Wood's), Princess Royal (Youell's), Renown, Rival King, Rosy Queen, Speciosa, Tagliioni, White Perfection. Good named varieties at 5s. to 9s. per dozen.

ACHIMENES — grandiflora, longiflora, pedunculatus, and rosea, at 1s. each, or 9s. per dozen.

*** Catalogues of Camellias, Greenhouse, and Herbaceous Plants, Petunias, &c., will be forwarded on application.

NEW SEEDLING CALCEOLARIAS, &c.

MESSRS. DICKSONS AND Co., NURSERY SEEDSMEN and FLORISTS, respectfully inform the Nobility, Gentry, and Amateurs, that their unrivalled Collection of NEW SEEDLING and NAMED CALCEOLARIAS, for which a Silver Medal was awarded by the Royal Caledonian Horticultural Society at their last Exhibition, are still in full bloom, and will continue in perfection for several weeks; as also a large Collection of New and Select GERANIUMS, PANSIES, &c., which can be viewed every day at the Nursery Grounds, Leith Walk.

D. and Co. at the same time beg to inform those who wish to improve their Collection of CALCEOLARIAS, that they intend to send out in October the following NEW SEEDLING VARIETIES, raised by them, and which will be found upon inspection to be inferior to none yet offered. The names are—Sir Walter Scott, Competitor, Prince Albert, Favourite, Exquisite, Captivation, Beauty Supreme, and Duke of Wellington, 10s. 6d. each.

ECLIPSE Richardson's, very superior to Standishii, with fine habit, and a very distinct flower.

NE PLUS ULTRA (Shanklie's), rose-colour, beautifully spotted with crimson, and splendid form.

LEITH WALK BEAUTY (Shanklie's), pure yellow ground, beautifully striped and spotted with scarlet, with large and fine form.

GEM (Scott's), white ground, richly spotted and striped with crimson, very superior to the similar one called the Duchess of Buccleuch.

STANDARD OF PERFECTION (Ferguson's), cream-colour, very distinctly marked all over with maroon and rose-coloured spots, with peculiarly perfect form.

DUKE OF BUCCLEUCH, large white ground, with fine large purple blotch, superior to Lucy. 15s. each.

*** Separate Catalogues may be had on application, including all the New Varieties of Geraniums, Calceolarias, Pansies, &c.

D. and Co. have for a long series of years made it their particular study to add everything new, of merit, to their choice Collection of FRUIT TREES, EVERGREEN and DECIDUOUS FLOWERING SHRUBS, GREEN-HOUSE, STOVE, and FLOWER GARDEN PLANTS; and they flatter themselves their Stock will on inspection be found most extensive and complete in every department.

*** Noblemen and Gentlemen may obtain superior Gardeners, Land Stewards, and Foresters, on application.

Planting contracted for.

Nursery, Leith Walk, Edinburgh, 1st June, 1844.

DRYING BOTANICAL SPECIMENS.

W. AND J. BENTALL beg to inform their Botanical Friends that they continue to prepare their Improved PAPER for DRYING PLANTS, and hope still to enjoy their patronage and support.

For the convenience of Collectors of Foreign, as well as British Plants, the Paper is now prepared in three sizes, and is delivered free in London, on the following terms: 16 by 10 ins., (folded), 14s. per Ream; 20 by 12 in., 20s. do.; 16 by 20 ins. (double the first named size), 25s. do. Specimens forwarded on application, and all orders promptly executed.

Paper-Mills, Halstead, Essex.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND. SEEDSMEN.

THOMAS GIBBS AND Co., corner of Half Moon-street, Piccadilly, London, having had the honour of being officially appointed the SEEDSMEN to the "ROYAL AGRICULTURAL SOCIETY OF ENGLAND," beg to assure the Members of the Society, and their Agricultural Friends in general, that this renewed mark of confidence will stimulate them to continued and fresh endeavours to merit so high a distinction. Among other Seeds they beg to call attention to the following.

TURNIPS.

Purple Top Swedish Turnip (combining large produce with beauty of form and smallness of top).

Green Top ditto ditto (hardy and useful variety).

Gibbs's Green Top Yellow Hybrid (strongly recommended—will bear sowing later than Swedes, and next to the Swede in hardiness).

Gibbs's Red ditto ditto (same as the above, with red top).

Green Globe Turnip.

Early Stubble Turnip, and other varieties of known good qualities.

GRASS SEEDS,

For forming permanent Meadows and Pastures.

Mixtures of Selected Natural Grass Seed for the purposes above mentioned, proportioned and adapted to suit the nature of different soils.

Please address, THOMAS GIBBS and Co., the Seedsmen to the "Royal Agricultural Society of England," corner of Half Moon-street, Piccadilly, London.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane-sq.

HOTHOUSES, CONSERVATORIES, &c., made and fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8s. Garden-Lights made and glazed from 1s. per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road.

*** Reference given.

CURTIS'S BUDDING-KNIFE.—"This is the neatest Budding-knife we have seen. The ivory handle is shaped like the blade of a curved penknife, sharp, and turned up at the point, and is evidently extremely well contrived for the purpose it is intended."—Opinion of Professor LINDLEY, in the *Gardeners' Chronicle*, July 29, 1843.

GEORGE PLUM, Surgical Instrument Maker and Cutler, No. 262, Strand, London, and at No. 3, Dolphin-street, Bristol, begs to call the attention of the public to the above new and desirable article, manufactured solely by him. Sent free to any part of the kingdom, on receipt of 38 penny postage stamps, or a post-office order for 3s. 2d.

WM. JOHN CORMACK, AGRICULTURAL SEEDSMAN by Appointment to His Royal Highness PRINCE ALBERT, New Cross, Surrey, and Bedford Conservatory, Covent Garden, begs to call the attention of the Nobility, Gentry, and Agriculturists in general to his combinations of GRASS SEEDS for Permanent Pasture, the Alternate Husbandry, Parks, Lawns, &c. (as recommended and practised by his partner, the late Mr. GEORGE SINCLAIR, Author of the "Hortus Gramineus Woburnensis.") Upwards of 25,000 acres have been converted to permanent pasture by this establishment with the greatest success. Parties requiring Seeds are respectfully requested to state the nature of the soils. Mangold Wurzel, Carrot, and Turnip-seed of excellent sorts, saved from transplanted bulbs. Garden and Agricultural Seeds of the best quality and most approved kinds.

N.B.—Cormack's British Queen and Prince Albert Peas, at 3s. 6d. per quart.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries, either personally or by post.

THORNE, Shepton Mallet; and other leading SEEDSMEN in town and country. Wholesale Agents, DAVY, MACKMURDO, and Co., 100, Upper-Thames-street, London.

HORTICULTURAL BUILDING & HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, Manor-place, King's Road, Chelsea, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. Wire-work in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

Ward's Cases, or Domestic Greenhouses.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to Public Competition, on the Premises, Providence Nursery, Park Lane, Liverpool Road, Islington, on MONDAY, JUNE 10th, 1844, at One o'clock, by order of Mr Ciscell, about 1500 GREENHOUSE PLANTS, consisting of Geraniums of the best kinds, Acacias, Diosmas, Fuchsias, Myrtles, Balsams, Heliotropes, Hydrangeas, &c. Also an excellent Iron Roller, Truck, &c. May be viewed on Saturday, 8th, and morning of sale. Catalogues may be had on the Premises; of the Principal Seedsmen; and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to Public Competition, at the Auction Mart, Bartholomew-lane, on TUESDAY, JUNE 11th, and THURSDAY, 13th, 1844, at 12 o'clock each day, a fine Collection of DAHLIAS, comprising all the leading varieties. Also a splendid assortment of GERANIUMS, the newest varieties of FUCHSIAS and VERBENAS, HEARTSEASE, and a variety of other Flowering Plants.—May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

SYDENHAM, KENT.

MESSRS. PROTHEROE AND MORRIS will submit to public competition on the premises, BRIAR COTTAGE, near the Dartmouth Arms, Sydenham, on THURSDAY, 20th JUNE, 1844, at 1 o'clock, the Entire Stock of CHOICE TULIPS, the collection of the late Mr. William Granger Jackson, comprising all the esteemed kinds in cultivation. Also IRON HOOPS and CANVAS, One and Two-Light BOXES, HAND-GLASSES, GARDEN UTENSILS, Sundry HOUSEHOLD FURNITURE, and other Effects. May be viewed one day prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS

MESSRS. PROTHEROE AND MORRIS have received instruction from Mr. BUNNEY, to submit to public competition on the premises, KINGSLAND NURSERY, about the second week in July, in consequence of the Lease having expired, the whole of the RARE EXOTICS and other Plants in pots; also SEVEN GREENHOUSES, PITS, &c. &c., in good condition, a quantity of Bricks, York Paving, and other Fixtures. May be viewed prior to the Sale, and Catalogues may be had of the principal Seedsmen, on the Premises, and of the Auctioneers, Leytonstone. The whole of the valuable Nursery Stock will be submitted to public competition by Auction about the third week in October.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. J. KING begs to inform the public that he is instructed to sell by Auction on the premises, Acre Lane, Brixton, on Monday, 17th June, at 10, by order of Mr. DAWSON, a COLLECTION OF CHOICE PLANTS, viz:—Camellias, Ericas, Epacris, Barrones, Serulata, Oleanders, Azaleas, Cacti, Croweas, Euonymus, Daphne, Polygaleæ, and a variety of other Plants. May be viewed, and Catalogues had on the premises, at Mr. CLERK's, Seedsman, Bishopsgate Street, and of the Auctioner, Hackney Road.

SALE OF A SPLENDID COLLECTION OF HOTHOUSE, GREENHOUSE, AND OTHER PLANTS.

T. M. FISHER respectfully announces that he is directed by Mr. WM. LODGE, to Sell by Auction, on Wednesday and Thursday, the 19th and 20th days of June, at the Nursery Grounds, Broughton-lane, Lower Broughton, in consequence of his Removing to Broughton Park, Higher Broughton, the whole of his excellent COLLECTION OF PLANTS, consisting of fine specimens of Geraniums, a splendid collection of Fuchsias, Camellias, Ericas, Achimenes, Calceolarias, Cinerarias, Petunias, Verbenas, Chrysanthemums, Roses, Pentstemons, Carnations and Picotees in Pots; about 500 Dahlias, of the best varieties; two Beds of Tulips, and about 600 choice Pansies, all in beautiful condition.

May be viewed six days prior to the sale, and Catalogues had on the Premises or from the Auctioneer, 17, Princess-street. Sale to commence each day at eleven o'clock. Manchester, June 7, 1844.

TO FLORISTS, &c.

FOR SALE, by Private Contract, at a great sacrifice, (for the benefit of the Creditors of John Birch, late of Oxford), a CHOICE BED of TULIPS, consisting of 46 rows, to be taken up by the Purchaser or his Agent.—For Catalogue and price apply to Mr. HOBBS, 23 St. Giles's street, Oxford.

FARM TO LET, situate in the parish of Great Chart, in the county of Kent, and about three miles from the Dover Railway station at Ashford, consisting of 99 A. 3 R. 19 P., viz.:—

	A.	R.	P.
House, Garden, &c.	1	0	20
Pasture	32	0	0
Wood	1	2	8
Arable	60	3	2
Hops	4	1	29
Outbounds	99	3	19
Inbounds	89	3	0

The Farm is well supplied with buildings. The Landlord finds rough materials, and pays half the expense of workmanship, for Repairs.

Rent, 90*l.*; Tithe Commutation, 25*l.* Total, 115*l.*

No person need apply who has not sufficient capital to cultivate the land well and employ labourers. References required. —Apply to Mr. RICHARD GREENHILL, Ashford.

FARM TO BE LET on LEASE—110 acres—in the County of Wilts, and within a few miles of the City of Bath. It is in the highest state of cultivation, with luxuriant standing Crops of Wheat, Barley, Beans, and Clover, which may be taken at a Valuation, and entered upon immediately.

The Farm has every modern Agricultural improvement, and is adapted for Farming on scientific principles. Flemish Ox-stalls, Sheep-fatting Sheds, Lambing Skillings and Barton, Liquid-manure Tanks, and every other accommodation that can be required for complete Farming. Extensive free-stone Farm-buildings, &c. &c. It consists of about 66 acres of Meadow and Pasture, and about 44 acres of Arable, and is situated in a luxuriant valley, through which a rapid brook passes.

In addition to the above, another Farm of 100 acres, on the hill, and adjoining to it (principally arable) may be had next year, when the present Lease expires.

The Farms are well situated, in the County of Wilts, and within five miles of Bath, in the neighbourhood of Railways, Canals, good Turnpike-roads, and Markets.

No Tenant will be accepted who cannot command 2000*l.* capital.

Apply to Mr. THOS. EVANS, Estate Agent, &c., No. 46, Milsom-street, Bath; or (Thursdays) No. 2, Bridge-street, Bristol.

TO BE LET, a GARDEN & COTTAGE.—Kitchen-Garden, partially cropped, full of Apple, Pear, and Plum-trees, of the best sorts; a wall covered with Peach-trees; a single room COTTAGE, with fire-place; Pig-styes, Tool house, &c.; with or without about Five Acres of Meadow; situate in the Harrow-road. If taken by a Gardener, employment for two or three days a week throughout the year can be given in the grounds adjoining. For terms and cards to view apply at 3, Soho-square.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.—The Second Meeting will take place on Saturday the 15th of June; subjects for Exhibition must be at this Office on Friday the 14th; or at the Garden before ½-past 8 o'clock, A.M., on the day of Exhibition.

Exhibitors will be provided with a printed form in which they will state, for the information of the Judges, whether their plants, &c. have been shown previously during this season.

The gates will be opened at One P.M. Tickets are issued to Fellows at this Office, price 5*s.* each; or at the Garden, in the afternoon of the days of Exhibition, at 7*s.* 6*d.* each; but only to orders from Fellows of the Society.

N B. No Tickets will be issued in Regent Street on the day of Exhibition.—21, Regent Street.

The Gardeners' Chronicle.

SATURDAY, JUNE 8, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Wednesday, June 12	.	Society of Arts . . .	8 P.M.
Tuesday, June 18	.	Linnean	8 P.M.
Wednesday, June 19	.	Microscopical . . .	8 P.M.

COUNTRY SHOW.—Tuesday, June 11—Gardeners' Benevolent Institution.

THE TULIP SEASON is now rapidly drawing to a close, although there are collections in Lancashire, Yorkshire, and the northern parts of England, where the bloom is still prolonged. The period of blooming has been singularly propitious. Much less damage than usual has been done by either frost or hailstorms; the flowers have consequently been exhibited in fine condition—and though in many beds a large quantity of bulbs have not flowered, still, on the whole, our accounts from various parts of the country are satisfactory.

We allude to Tulips at this time, for the sake of noticing the sad confusion that has arisen among the new varieties constantly breaking into colour. For many years past great quantities of Breeders have been raised, and in many instances distributed over the country, without even a number being attached to them. The consequence is, that everybody who has one of these in fine character considers himself entitled to name it: such a bulb, so named, in the course of time gets, often at a serious cost, into the collections of buyers, who, after watching the bloom through its progressive stages of growth with intense anxiety, have the inexpressible mortification to find that they have one or two similar varieties, broken from Breeders already in their possession.

That one cannot have too much of a good thing does not justify the system of letting out nameless flowers; and it would be far better if the raisers would name each really good Breeder before they part with it. They would then get that credit of their own flower which they deserve, for it would retain its name if broken in fine character; on the other hand, if not worth growing when come into colour, both the name and bulb would be consigned to oblivion. This plan has been adopted by some growers in both the North and South; and if the far-famed Polyphemus had been named when its good qualities as a Breeder were first developed, we should not now be perplexed with such a string of "aliases."

We allude to this flower as a case in point, and there are numbers of others in a similar predicament, with from two to half-a-dozen names each. We remember a fine rose Breeder raised by Mr. Dixon, of Manchester, which, before he parted with, he styled "Arlette." It is now in the collections of fifty different cultivators, has been broke into colour by the majority of them, is known by no other name, and Arlette is Arlette still. On the other hand, we have purchased bulbs of a florist in the midland counties, known as a successful raiser of seedling Tulips, who when they first flowered numbered them, up to about two hundred and seventy varieties, but then as the stock increased discontinued doing so, and now his Breeders, breaking into colour in all directions, are obtaining fresh names in each locality, and will furnish as inextricable a mass of confusion to the midland as Clark's varieties do to the southern growers. That this state of things is lamentable enough will be allowed on all hands; but the worst of it is, that every season the maze gets more intricate. If, however, these suggestions are well received, they would in a great measure remedy the inconvenience in future. That some plan of the kind should be adopted is not less important to the grower than the purchaser, for there are hundreds of thousands of seedlings coming forward in this kingdom, many of which in the Breeder state cannot be distinguished.

Now that the standard of perfection is well known, and is acted on, even in remote localities, we trust that all stained cups, and varieties with ill-formed petals, will be thrown aside, along with all those varieties which have so long retained a place in collections, although they have such defects. Having lately officiated as censor in various parts of the country, we have had the opportunity of observing how rapid an improvement is taking place in public opinion in this particular, and how generally the correct principles of estimating the properties of a fine Tulip are appreciated by the whole body of Florists. Growers will save themselves an immensity of trouble by bearing this in mind. For it is a terrible waste of time, trouble, and garden-room, to say nothing of the mortification of it, to break a seedling Breeder, with extra fine flame or feather, and then to find that it is worthless, in consequence of having "prick-eared" petals, a foul cup, or some other defect, which cannot now be allowed in a first-rate flower. We have lately witnessed several instances where seedlings (Feathered Byblomens) have, to all outward appearance, been superb—the cup fine in shape, the white pure as snow, the feathering confined to the edge, and the breadth of the marking on Dickson's Trip to Cambridge Picotee, and of a shining jetty black; but, to our own sorrow, and the mortification of the raiser, the filaments of the anthers were as black as ink, and on examining the Breeder the same defect was observable. Had these flowers, after ten years' culture (which is the time, on an average, from sowing the seed to breaking into colour), been of very worthless, undecided character, the disappointment would not have been so great; but their being, as it were, within a hair's-breadth of the mark, and only cast for what, in some people's estimation, would be a trifling blemish, proves the necessity of adhering to first principles in the outset, by destroying, as soon as they bloom, all Breeders which do not come up to the standard.—*W.*

WE have before us an official report, by Mr. Griffith, on the state of the BOTANIC GARDEN, CALCUTTA, in 1843, with a complete list of the plants then actually existing in the garden, and of the library attached to it. Considering the reputation enjoyed by this great establishment, the liberal manner in which the East India Company has maintained it, and the glowing terms in which it was spoken of in 1823, by Bishop Heber, who described it as not only a curious but a picturesque and most beautiful scene, which more perfectly answers to Milton's idea of Paradise, than anything which he ever saw *, we were certainly not prepared for such an account of its present condition as we find in Mr. Griffith's statement.

He describes it as having no proper fence, but being accessible from all quarters; as wanting in methodical arrangement; as laid out partly in landscape style, and partly in an old and obsolete artificial style; as being choked with trees, many of them mutilated and some half-blown down; and as having an immense extent of borders which "are neither flower-borders nor shrubberies." The tickets to the few plants which are named, are described as being in Bengalee, intelligible to nobody but the clerk who wrote them, so that they are useless to the students of the Medical College in their weekly visits. Mr. Griffith states that (in Dr. Wallich's absence) the only person in the garden acquainted with the names of the plants is Buxoo, a head Malee—a person of abilities and extraordinary memory; but if any accident were to happen to him no evidence of the contents of the garden would remain. Moreover, the seeds for distribution, and the plants in the nurseries, are said not to correspond in names with those used by Mr. Buxoo; and, finally, it is reported that the collections do not contain above 250 species more than are mentioned in the catalogue published by Dr. Roxburgh 29 years ago. In another place we find the number of species contained in the garden set down at 3500 (p. 108).

This is certainly, if not too highly coloured, a melancholy picture of the decrepitude of a noble institution; it is some satisfaction, however, to know that vigorous measures have been already taken by the Government of India to renovate it. The official publication of Mr. Griffith's report indicates the intention of adopting at least the most essential of the measures of reform which he advocates; and our private correspondence informs us that very considerable improvements have already been introduced.

We learn that a garden on the natural system is preparing; that the beds for cuttings are rearranged and repaired with brick edgings and sand, and that glazed frames have been constructed for the shelter of those tender seedlings which perish during the cold season. A Teak plantation, described in the report (p. 109) as an entire failure, which has been felled with the exception of a few fine specimens, has produced the sum of 4000 rupees, which it is hoped will be applied to the construction of glass-houses, walls for Grapes, and other useful or ornamental buildings. In short, what with the reformation made, and the improvements contemplated, we understand that the whole features of the garden will be changed, and that in another year it will once more resemble the Paradise that delighted Bishop Heber.

We hope to be able, from time to time, to acquaint our readers with what is going on in the Calcutta Garden, which it is to be hoped will receive from Mr. Griffith's report as much advantage as has accrued to Kew from a similar investigation of the management of that institution some years since. Kew has arisen from its slumber with more energy and enterprise than ever. May Calcutta do the same!

* Indian Journal, Murray's Colonial Edition, p. 40.

REMARKS ON SAVING ROSE SEED, AND RAISING SEEDLINGS.

THE season is fast approaching when the English Rosaries will again present a scene of beauty, and many new and improved varieties of this favourite flower will doubtless meet the gaze of those amateurs who have recently improved their collections, or who may be disposed to visit those of more enthusiastic cultivators. In viewing these continual improvements, the result of continental skill, the question may probably have arisen in the minds of many—How is it that the raising of Roses from seed has hitherto engaged but little the attention of English florists? It is not unfrequently said, that the climate of England is not suitable for this branch of culture, in consequence of the double varieties scarcely ever perfecting their seed here. It may appear that if we can only save seed from the least double varieties—fulness being an essential qualification of a good Rose—we cannot reasonably expect any great measure of success. That our climate is less favourable for saving seed than that of the Continent, is readily admitted; but may we be allowed to ask, if that difference is sufficient to warrant us in concluding that our endeavours would not be reasonably rewarded? Practically speaking we may presume not; for the Roses Blairii, No. 1 and No. 2, George the Fourth, and numerous others we might mention, are of English origin. But few very double varieties seed here it is true; and this may also be said of some parts where many of our finest Roses were originated. Some of our best and latest new Roses have been produced from seed gathered from hybrids—Athelin and Celine—two varieties which seed abundantly here even in unfavourable seasons; and it is from these have sprung a portion of that beautiful class termed Hybrid Perpetuals. Presuming, then, there are good reasons to believe that varieties of standard merit may be raised here, let us mention a few kinds which seed freely in England, and appear well suited for female parents. First among the hybrid Chinese are—Athelin and Celine, Ne Plus Ultra, Duke of Devonshire, Chatelain, Princess Augusta, Henri Barbet, Globe White Hip, General Allard, Aurora, and others. These might be crossed with some of the freest-blooming Damask Perpetual or Bourbon Roses, to endeavour to obtain an increase of, and an improvement among the hardy autumnal Roses. The Ayrshire and Sempervirens, among which there is a paucity of high-coloured flowers, might be fertilised with the farina of some dark varieties, selected from those sections which approach nearest to them in natural character. Here Ruga, Splendens, and Leopoldine d'Orleans, might form the female parents. Among the Moss, the single Crimson, Du Luxembourg, and Eclatante, occasionally seed. Among the Briers, the Double Yellow and Harrisonii. Among the Bourbons, the Old or de Lisle, Augustine Lelieur, Dubourg, Gloire de Rosaménes, Emile Courtier, and Bouquet de Flore. Among the Chinese, Camellia blanc, Fabvier, Therése Stravius, Alba, Belle Elvire, Henri Cinque, and Madame Bureau. Among the Tea-scented, Odorata, Jaune, Hamon, Lyonnais, Hardy, Lady Granville, Caroline, Goubault, Belle Allemande, and Bardon. Many of the least-double Gallica Roses also seed freely. These, and many others, which, by seeding, have doubtless at some time struck their possessors, may be taken as female parents, and crossed with whatever varieties the fancy of the operator may suggest. How far the experiment of crossing the different sections may be carried into effect, it is not easy to determine; but the peculiarity of certain features existing in some varieties, and readily traceable to their parents, leads us to think the scene of action will not be found very limited.

As the female parent will in many cases be but semi-double, we should endeavour to counteract the probable results of this, by crossing with farina gathered from the most double varieties that we can collect it from. The plants intended to seed should be selected in a good state of growth, and never allowed to suffer from drought. Where they bloom in trusses, the backward flower-buds should be cut out, leaving not more than six of the plumpest and most perfect buds on one flower-stalk. We are no doubt indebted to accidental crossing, in a great measure, for the various novelties and improvements in the Rose tribe. Artificial crossing, however, appears the only probable method of obtaining an end in view; and although this is at first somewhat tedious, it will be found to increase in interest as we become familiar with its application. Just as the flowers intended to be crossed are expanding, it will be necessary to remove the anthers, or they will burst, and the flower thus become self-impregnated. They may be removed early in the day, with a small pair of scissors; and in a sunny hour, flowers should be gathered from the variety we intend to cross with, and the pollen dusted on the stigma of the flowers of the opposite parent. A truss of flowers may be crossed with one kind, and a gauze bag drawn over each truss when the operation is completed, to prevent the perversion of our designs by the countless millions which swarm in the air at this season of the year. The dusting of the pollen may be repeated once or twice, to make our purpose sure. If we wish to know the results of our crossing, and whence the seedlings spring, leaden numbers may be attached to each flower-stalk, and corresponding ones with the names of the parents affixed, be written in a book. Probably after crossing,

the seeds have seldom been kept separate, on account of the trouble it would occasion; nevertheless, raisers have been able, by tracing a little, and guessing a great deal, to acquaint us with the progenitors of their seedlings. But what might be known for certainty, thus often becomes a matter of speculation.

In autumn, as soon as the seed is ripe, it should be gathered and placed with the number in the gauze-bags previously used, and left in the seed-vessel till required for sowing. We may sow the seeds as soon as ripe, or, in spring, when some will germinate immediately; but the greater part will not until the year following. If the seed be kept a twelvemonth before sowing, it should be buried in the seed-vessels in boxes of sand or light earth kept moist, and not exposed to extremes of temperature. It may be sown either in seed-pans, in a frame, or in the open border; if the latter, an eastern exposure is most favourable, and, in all cases, the soil in which it is sown should be rich and light. We should sow thin, that the plants when growing may not crowd each other and become weak. The seed should not be sown too deep, and after sowing, the surface of the soil may be strewn with a light covering of Moss; as the seeds break through, this may be removed, and protection afforded against slugs and birds. It will also be advisable to shade and water them, and where too thick to transplant the weakest at an early stage of growth. Transplanting should, however, be avoided if possible, as it ordinarily retards the period of flowering. Some of the seedling Indicas will flower in the autumn of the same year, but for the mass we must wait one or two subsequent seasons. As winter approaches, some plan must be devised to protect them from frost, as the plants, in general being young, are more than usually tender. One advantage gained by sowing in pans or in a frame is, the efficient mode in which we can accomplish this, by removing the former to a pit or greenhouse, and affording protection to the latter in the usual manner. When sown in the border, they must be covered with Moss, or some protecting substance, to shield them from the frost.—*W. Paul, Nurseries, Cheshunt, Herts.*

THE CULTIVATION OF CACTI.

By L. ZAPF, Gardener, Leipsig.

THE treatment of Cacti during summer is simple and generally known. With sufficient water, not sparing it, as generally happens, and free access of air, they will take care of themselves, with the exception of unrooted offsets, Melocacti, and some Mammillarias. They thrive well in summer kept in the open air, without any covering, if they are allowed to have plenty of water. With this treatment there is little danger of the plants being attacked by red spider or scale. But should spider appear, I know of no better means of getting rid of it than by sprinkling the plants thickly with flowers of sulphur; and an abundant washing with clean water with a syringe helps to destroy the scale. The treatment of Cacti during winter is very different from that of summer. In their native country the dry time of year has the same effect upon those plants as winter has on ours, namely, it produces a state of rest. In this state, if they are to remain in health, and flower the following summer, they should not be removed to a cold greenhouse, for in their native country they do not arrive at maturity through cold, but by the dryness of their situation. Indeed, the experience of many years has taught me that they thrive well if they are kept in a hot-house.

When Cacti are removed in autumn from the open air into a hot-house, do not leave off watering them immediately, because that would interrupt vegetation too suddenly; but continue to water them regularly until nearly the end of the year, only not so abundantly as before, and stop it by degrees until the end of December, when it must be discontinued altogether. From this time to the period when the plants can be again placed in the open air they need no water, not even if they should begin to dry up or to shrivel, for there is no danger of their being injured by getting into that state; but great disadvantage would arise from watering them, and many specimens might be lost. No doubt when watering is discontinued roots are apt to die off, because being less succulent than the plant itself they soon lose their moisture, which cannot be replaced out of the dry earth. This, however, does not harm the plants in a dry state, but at a later period, when watering is renewed, it then may have disadvantageous consequences, for it is then found that the dead and withered roots easily decay, and this communicates itself by degrees to the centre of the plant, which then speedily perishes. It is, therefore, indispensable that the plants should be examined in order to see whether rottenness is beginning; for if this is discovered too late there is no remedy, and the decay will extend, and destroy the plants.

There is no great difficulty in the propagation of Cacti. However, there are many, especially among the better and rarer sorts, that are not easily propagated. If offsets do not in a short time strike out roots, the reason is because the cut surface is woody, and many months, and even years, may elapse before they again form new roots. I have succeeded in propagating Pilocereus senilis (Lemaire), Cereus Bradypus (Lehm), and C. senilis (De Cand.), in the following manner, by offsets: viz., I filled a pot with earth, and put it into a larger one, so that the edge of the outer pot stood nearly an inch above the inner one. The large pot, having the hole at the bottom stopped up, was filled with water until it was level with the earth in the inner pot; in this earth the offsets were planted; the whole was then covered with a piece of glass, and exposed to the rays of the sun. It is necessary to look after it frequently, in order to renew the water, if it should evaporate too much. In this way offsets of these made roots very soon. This treatment can also be applied with favourable consequences to the offsets of other Cacti, whose cut surface is much withered. It is necessary to keep the offsets continually damp; and in order to accomplish this they should be put into pots from 8 to 10 inches in diameter; and after every watering, which should be repeated as often as necessary, the pot should be covered with a piece of glass. The more common kinds propagate easily of themselves, and do not require much trouble or attention.

These observations are the result of 10 years' experience in the rich collection of Cacti belonging to Mr. Kob, in Leipsig, which contains, with the new and undescribed forms, about 450 sorts; amongst them are 150 Mammillarias, 90 Echinocacti, and a part of the most handsome Cerei.—*Abstracted from the Gartenzeitung.*

ROSE GARDEN.—No. XI.

(*Continued from page 357.*)

Labelling.—As each tree is budded, a paper or parchment should be fastened upon it, to mark the species;

and when the whole are finished, if they are in lines, the first and last tree of the lines may be marked as follows; if separate, each tree should be so treated:—Procure from the plumber a sheet of lead, the thickness of a sixpence or a shilling; cut it into long squares, upon which stamp the name of the species, and affix the label to the plant by means of a small piece of *copper* wire, which should not be twisted tight round the stock, but half or a whole inch left for it to swell out in. The punch to cut the hole in the label should be a shoe-maker's nipping-punch; and if the lead adheres to it, a little oil should be used—the thinner the lead the less likely to stick. The letters are procurable at any tool-shop, and should be small ones, as in the engraving. A pair of small nippers and pincers should be used to twist the wire, which may be cut into suitable lengths beforehand.

Body-Budding.—Budding upon the body, instead of upon the shoot of the tree, is peculiarly applicable to young and clean stocks, with round fruit, as their bark is less hard. It frequently succeeds half way down the stock, in preference to the upper part, (i. e. below all the shoots better than between them); and is advantageous when the shoots are not large enough to bud upon, or when they cannot be used without running the chance of depriving the tree of its support, which is always the case when they are not very healthy or strong, in which case the tree should be budded low down; and it has this advantage also, that it leaves but one wound to heal instead of two, and that closes over better, from the tendency of the new shoot to rise straight up and cover the injury; whereas, in shoot-budding, the wound is below the bud. It is also useful in case there be but one shoot to work upon, when another may be inserted in the body, opposed to that in the shoot.

In nurseries, where it is desirable to have every sort of Rose, and of every height, the small species of Briar, which is quite green at the age it is used, is planted in long rows, quite free, unsupported, and left almost to itself, entered in the ground with all the upper branches cut off similar to the others, and of a much greater length than desirable to use. These small briars push vigorously at the top; they are left to form what heads they please; and in July the buds desirable are entered, (with great care, for, being pithy, too deep an incision would cause them to break,) with buds of the most delicate sort, any distance desired below the head; and in March these heads are cut off an inch above the bud, the plant being young and growing, and the sap well fitted to the plant to spring from the bud. They generally make more appearance the first season, in proportion to their size, than large ones; and almost always cover their wounds better, but they do not readily attain the same size.

Home Correspondence.

Mexican Coniferæ.—The Leading Article in the *Chronicle* of May 18th has suggested to me that possibly the following evidence, deduced from observations in the Bicton (near Sidmouth) Arboretum, may not be uninteresting. The results are in some cases different from your own conclusions, but, taking the subject in a general way, are very similar. I have found Pinus oocarpa to survive two winters without injury, merely protected by a large sea-kale pot by night, and removed in the day, except in case of sharp frosts and cutting winds. P. leiophylla is one of the hardiest, having stood four years without the slightest protection, and has not been the least injured; it now measures 7 feet in height. P. pseudo-strobus was, by the early frosts of last autumn, much injured, and, to complete its destruction, was eaten off by deer and totally killed; I have again planted one for another trial. P. Teocote is quite hardy, having stood three winters unprotected; this appears to be a fast grower, making from 1½ ft. to 2 ft. in its young state, in the course of a season. P. Macrophylla has been planted two years, and has stood the last winter unprotected and uninjured. P. Devoniana has not been sufficiently proved to draw any conclusions as to its hardiness, it having been planted one winter, and covered by Croggon's Asphalte. P. Russelliana, apulcensis, and montezumæ, are equally hardy with macrophylla. P. patula is not in any respect damaged, although it has had no protection for two years, and is now making as vigorous shoots as any in the Arboretum: it stands 5 ft. high. P. Hartwegii would appear to be a Pinus of great promise, taking both its beauty and the fact that it proves hardy in most places; indeed, as far as my knowledge of it extends, I should be almost inclined to say it would rival the Scotch Pine in hardiness. P. Ayacahuite was totally destroyed by the early frosts of last autumn. P. Llaveana has not been fairly tried. Of the beautiful Abies religiosa, if the hardiness could be established beyond a doubt, we might be truly glad. I am quite of opinion that if planted in a rather poor and dry soil, it would so progress as to ripen its wood thoroughly, and, consequently, be so circumstanced as to defy the rigour of our ordinary winters; the plant here is so situated, and from present appearances leads me to believe, if left exposed next winter, would bear it with indifference; the protection of a sea-kale pot was afforded it last winter, which was quite sufficient, as the plant is looking perfectly healthy. Cupressus thurifera and Juniperus flaccida, though placed under similar circumstances, differ a little in their degrees of hardiness. The first is quite hardy, if four years' exposure without the slighest protection warrants the assertion. The latter (perhaps from its lower situation compared with the Pinuses, and consequent liability to earlier and later frosts) is a little cut, but not so as to disfigure the plant. The soil on which these are planted is a dry sandy loam, on a substratum of red sand, sloping to the south-east, and although situated rather low is exposed to every wind, excepting one part, which is a little sheltered from due north. This situation will undoubtedly suit Coniferæ in general remarkably well, as may be inferred from the vigorous growth of some established plants, amongst which may be mentioned Pinus insignis, which has been planted five years and is now 20 ft. in height, and particularly handsome; four cones are showing on its leader. Abies Douglasii, 11 ft.; A Menziesii, 6 ft.; Picea Cephalonica, 8 ft.—this is undoubtedly one of the finest plants of its kind in this country; and Cedrus deodara, 10 ft. in height. All the species of Coniferæ procurable have been planted here, and are making great progress. This will form an interesting part of the whole collection of trees and shrubs, and every successive year will add greatly to its beauty.—*N. Mitchell, the Arboretum, Bicton.*——Sir, Charles Lemon informs us that at Carclew, near Penrhyn, Abies religiosa proves perfectly hardy. On the 22d of May its buds were only pushing off their winter covering, and since there are no autumn frosts in Cornwall, as there are in Middlesex, this beautiful species does not, in the former county, suffer at all from growing late. It is even slower in spring growth than A. Morinda, or Webbiana.

Gooseberry Caterpillar.—This year, owing to the long-continued dry winds, has been particulary favourable to the production of myriads of the Abraxas Grossulariata (the Gooseberry Caterpillar and Currant Moth), which in all parts of the country appears to be more than usually numerous. In general, as yet (25th May), the caterpillars are in the egg state, but in early sheltered places they are transformed into the caterpillar, and are nearly approaching the chrysalis state, so that by the time they are in that condition they are scattered over a considerable extent of the bush, stripping it entirely of its summer foliage, to the utter destruction of the fruit. Now, while all this is going on, very often the owner, much to his loss and disappointment, allows these depredators to carry on the work of destruction, enjoying themselves at his expense, while he inquires of every one if they know of any cure for the caterpillar? But, in general, he is made but little wiser. To such I would offer a few remarks on the safest method of getting rid of these unwelcome visitors. As the eggs of the Gooseberry Moth are laid in lines on the back of the leaves, they are easily destroyed on the bush while in that state, without injuring either the bush or the fruit; and, as there may be a

succession of young larvæ for a considerable length of time, we should need to repeat the cure every other week, which would perhaps be troublesome, as well as expensive. From experience, I have found hand-picking the surest plan in the end, if judiciously done. My plan is this:—I go round and examine the centre or heart of the bush; by this view of the bush you can easily perceive the leaves that are attacked by caterpillars, as they will be seen perforated with small holes, as if pierced with a pin. Yet after these are all off the bush, you have not finished your labour, as there may be a great number of leaves with the caterpillar in the ovum or egg state in hundreds on the back of these leaves, ready to sally forth in a few days and devour the foliage; therefore you must go round and lift up the branches one by one, and look upward, on the back of the largest and most detached foliage; you may there see the eggs laid in great numbers on the back of the leaves. If one single leaf in this state is pulled off, what a saving of labour and vexation is gained! Besides, if the caterpillars had been left undisturbed, perhaps for a day or two, you would have had to seek them throughout the whole, or a considerable portion of the bush. As Necessity is frequently the mother of Invention, I lately fell on a plan which facilitates the work a great deal; the plan is as simple as it is successful, and although it may be thought rather a novel method, yet if one once becomes accustomed to it, it will be found of great service in getting a proper view of many parts of the bush that could not be got at otherwise:—Take a common hand-mirror, or looking-glass, and with one hand hold it under the leaves of the bush, near the ground, and move it in different directions under the branches, and by looking into the glass you will get a view of the back of the leaves on all the bush, where you would not otherwise see under them; then, while looking into the glass, you will see the eggs on the back of the leaves, while by your eye you can direct your other hand to the proper leaf; and by picking off the caterpillars on the leaves in this state, what a world of future labour is saved! as I have frequently counted from 80 to 150 on the back of a single leaf.—*A. Walker, Muiryfold Grange, Banffshire.*

The Weather.—Many years ago, by constant observation, for almost forty years past, that I have kept a weather journal, I have noticed in settled frosty winters, and in dry winds, that there is a more humid cloudy atmosphere on the 4th and 5th days after the new and full moon; and though subject to various modifying causes connected with the phenomena of the weather, I have still been able to trace the existence of more vapours after the subsidence of the great tide of the full and change of the moon. The peculiarity of the present season had induced me, the last change and full moon, to take particular notice; and I predicted, with success, the increased moisture of the air, and sent a communication, signed "W." to the editor of the *Worcester Journal*, a fortnight ago, and again in the publication of this week,* and I should like to hear the opinion of learned Meteorologists on this matter. The surface of the Great Tank, the Atlantic Ocean, as Mr. Kirwan has said, is the great arbiter of our seasons, yet no Meteorological Society takes notice of it! From the information I have received of unusual rains in Andalusia and along the coast of Algiers, I attribute to them the long continuance of the N.E. winds in England and France. When the Duke of Wellington was in Spain, about 1809, when his dispatches mentioned the bad state of the roads, owing to rains, I noticed we had northerly winds in England; and I have afterwards recorded in my weather journal, a current of air towards any place where there has been a great precipitation of rain or snow.—*John Williams.*

Pine Apples.—Various experiments have led me to believe that partially intercepting the rays of the sun for a few hours in the middle of very bright days, and occasionally dewing the plants in fruit in the early stages of their growth, does not injuriously affect the flavour of the fruit, provided that water is entirely withheld three weeks previous to the time that the fruit changes colour. The Providence, Enville, and Antigua I never water nor shade six weeks after they have bloomed, and such as the Montserrat, Jamaica, &c., I do not water after seven or eight weeks, as these sorts are longer in ripening. So rapid has been the growth of the three former varieties, round in that time, and increased in weight from 16 to 20 ounces per week. I have hitherto made it my study by artificial means to surpass a tropical climate, by imitating a moist and dry atmosphere in the same house, and at the same season. This I accomplish by so arranging the plants that I can sprinkle and shade those that are growing, whilst those that are maturing their fruit have the benefit of all the light and sun, and thus I effect one of the most important objects of Pine culture, namely, encouraging rapid growth in one set of plants, whilst others are ripening their fruit. By thus deviating from a natural climate, I manage to cut at least eleven months out of the twelve, whereas, if I was to imitate a tropical climate, my fruit would be all produced at one particular season. I have tasted a great number of my Pines every season, and have therefore had an opportunity of attesting the results of my experiments. Some seasons I have never shaded nor sprinkled those in fruit, whilst in other seasons both shading and sprinkling were practised, and the fruit in both cases were equally delicious; therefore my opinion is that the flavour does not so much depend on a scorching sun as on the health and vigour of the plant. In this opinion I am borne out by the fact that my largest fruit were invariably the most juicy and delicious in flavour. I may further state, that since I commenced my present system, the flavour of the fruit has been more than ever applauded; and I imagine that the cause of this superiority in flavour arises from the increase of the minute fibres, for the more minute and numerous those agents of absorption are, the more abundantly will the plant be supplied with wholesome food, which will of course aid the swelling of the fruit and lessen the size of the crown. I have cut fruit upwards of 6lbs. with tops not more than 3 inches long. While I have been at Thornfield, I have been so unfortunate as to burn the roots twice during the last six years, owing to the valves of the heating apparatus getting out of repair, and any experienced Pine-grower will guess the consequence, namely, small fruit with immense tops, and of course inferior in flavour. Fruit of this description may be observed at our Manchester Horticultural Exhibitions, and also in the fruiterers' windows: they resemble men's heads with baby faces, particularly the Montserrats, which rarely exceed 3lbs. in that locality. The readers of the *Chronicle* will thus see how it is that I am considered an enemy to gardeners in that neighbourhood, because in publishing my book their ignorance and indolence are exposed by the statement there made, viz., that I have grown the Montserrat from 6 to 7lbs. and upwards. In conclusion, I beg to state that I shall ever feel grateful for the trouble that has been taken in investigating the truth of the affair, and thereby preserving my reputation and character.—*Joseph Hamilton.*

Morphology.—One of the most conclusive proofs of the truth of the doctrine of Morphology, which has ever come under my notice, occurred here last season. Some small branches on an Epacris nivalis flowered to the very extreme point, and in three different instances the pistil or female organ of the most terminal flower reverted into a branch, and for months afterwards the cup of the flower might be seen encircling the young branch. These branches, or if you please, elongated pistils, remained fresh until the branches were gathered, at which time they were from four to ten inches long; and I believe that had they been left upon the plant, they would have continued fresh until the present time. Now, although anti-morphologists admit, that by a proper modification of external agencies, it is in the power of the cultivator to make a plant produce either flowers or branches, yet they contend that when the flower buds are once formed, they never revert into branches. Here, however, is a proof of the contrary; and as the same plant has produced a number of similar examples this season, some of which I forward with this communication, I shall be proud, for the furtherence of science, to allow any one who may think proper to call at this place, to examine for himself as to the truth of this statement. On one of the specimens sent are two flowers with the young branches, each about an inch long, and on the other several branches are just peeping from the flowers, and in others some of the pistils are in the transition state, with the first leaves of the future branch just perceptible. Another singular proof of the truth of Morphology came under my notice a few days back, on a plant of Fuchsia Venus Victrix, one branch of which was so transformed as to produce some of the flowers half leaves, and other leaves half flowers, with petals at the top of the stamens, and another at the top of the petals, and a number of flowers metamorphosed into one. Now if these things do not prove that leaves and flowers are one common organ, and that fruit are stunted branches, how does it come that the flowers of the Fuchsias were part leaves, and some of the leaves part flowers; and that, in the case of the Epacris, the very part that would have formed the fruit reverted into branches, of which I have now about twenty growing specimens upon the plant? There is no disease here, and the plant from which the specimens are taken is as healthy as a plant can be, and the flowers were in every respect perfectly formed before the metamorphosis took place. Can anti-morphologists explain this, not by mere assertion, or declamation, but by sound reasoning? If, as they assert, all things were created perfect, and if those who assert that all things proceed from "imperfection to perfection," are to be stigmatised as Atheists, what kind of persons must Florists be?—for they are not satisfied with the fair forms of Nature, but by hybridising and cross-breeding have brought into existence thousands of varieties in the vegetable kingdom, which most assuredly were not created when all things were "made perfect;" and more especially what an Infidel must that man be who, not content with finding fault, must e'en set up "standards of perfection," which Nature must approach before she can be perfect?—*W. P. Ayres.*

Whitney's Composition.—My experience of Whitney's Composition, and of the effect of covering wall-trees, very nearly agrees with that of your correspondent "Rambler." I did not find the composition go half as far as I was led to expect. I prepared with it one half of a frame, twelve feet long and six wide, dressing the other half with the composition recommended by "Devoniensis," at p. 301 of 1843, adding, however, one ounce more of resin and half an ounce of sugar of lead to the quantities he recommends. Both halves are equally transparent and equally waterproof; the only difference is in the expense, which is very greatly in favour of "Devoniensis." The fruit (Peaches and Nectarines) set abundantly and well, and is swelling favourably; but the leaves are blistered, though not more so than in ordinary seasons. I am much subject to it. I mean to apply the frames again to my trees next spring.—*Lignemont.*

Strawberry.—Observing a notice lately respecting ripe Strawberries gathered at Forton Cottage, Lancaster, on the 26th of May, I beg to say it will, to all appearance, be at least a fortnight before they are ripe in this vicinity, even in the most favoured situations (rubble-stone beds may be an exception). I may also observe, that having cultivated Myatt's British Queen from the first of its being let out, having at this time between one and two acres of that variety, I have now some single plants not two years old, with an average of 20, some 30 trusses of fruit on each plant, and all, even the smallest runners, producing fruit. I feel confident that, with proper culture, they are as prolific as any Strawberry grown, Prince Albert excepted.—*Y., Manchester.*

Pea.—On the 7th of December, 1843, I sowed the Prince Albert Pea, Shilling's Early Grotto, and the Old Early May. The Albert was first ready for table. I gathered a good dish on the 20th of May, but the pods were small, with only three or four in a pod. Shilling's Early Grotto was next; it is by far the best, although five days later: it has a good pod, with five or six Peas in it. The Old Early May, which for cropping is preferable to either, was ready on the 28th of May; all the three varieties were sown under a south wall, and had the same treatment.—*Bath.*

Anecdote of a Tomtit.—About three weeks ago a tomtit built her nest in the post-office-box, where letters are hourly put in, and taken out twice a day. Three times was it taken out; the fourth time she was allowed to have her own way, and has now four young ones going out and in regularly at the hole where the letters are put in. The post-office stands close to the school in Frampton, the property of R. B. Sheridan, Esq., and is on the main road leading from Dorchester to Taunton.—*Wm. Brewis, gardener to R. B. Sheridan, Esq.*

Prolific Cowslips.—This season these have produced prodigious heads of full-blown flowers upon single stems. In Forton Cottage Garden I was induced to count the number of full-blown flower-pips upon two separate stems; upon one of them there were 108 pips, and on the other were 120 pips, and several of them were double pips, similar to the one here inclosed; and there has been one grown in the Rectory garden, at Standish, with 146 pips upon it; another, in the garden of Mr. Smith, of Preston, produced the surprising number of 158 pips. These numbers far exceed any I have ever met with before.—*Facile.*

Paper for Drying Plants.—I have had an opportunity of trying the new paper for drying specimens of plants, manufactured by Messrs. Bentall, of Halsted, and advertised at p. 293 of the *Gardeners' Chronicle*, and find it to be excellently suited for that purpose. It is well deserving of the attention of botanists who desire to possess well dried specimens, retaining the colour of their flowers and foliage.—*Charles C. Babington.* [We quite agree in this opinion. The paper is as good as possible.]

Bees and their Nightcaps.—I send a glass of honey in the comb, and beg the opinion of the Editor of the *Gardeners' Chronicle* as to its quality. The weight is six lbs. I also send with it a short account how it was procured. On the 14th of May, 1844, this glass of honey in the comb was taken from a hive of bees, from an apiary about 10 miles from London. I was induced to take it from observing, on the day previous, several drone bees flying about in front of the hive, rolling their eyes about; one in particular winked one or both eyes, which I took to signify that he meant to taste it. As all Entomologists know that the eye, in the bee tribe, is a fixture, this rolling their eye about was quite enough to raise my suspicion. This was seen through a Wrotham telescope. The peculiar flavour of this honey is easily accounted for, that is, if we readers of the *Chronicle* have not been misinformed. The bees have collected the honey from the flowers of the Polyanthus, Roses, Pinks, and Lilies—I forget which of the Lily tribe—perhaps the Lilies of the Valley. This can be known by referring to the catalogue of bee flowers furnished by "Apius." Another, and to me rather a remarkable thing is, that the honey was not collected by slave or factory bees; none of the bees work more

* "I long since came to a conclusion that there is an addition to the moist state of the air on the fourth and fifth days after each full and change of the moon, and that such addition of aqueous vapour often occasions rain, snow, or cloudiness on these days; but there are so many complicated processes instituted by the Great Author of all things, which have an influence on the atmosphere, that the above changes are subject to modification in various ways; and, without taking these into account, the addition of aqueous vapour on the days I have notified may not be perceptible to a casual observer. I will give one instance: a S. or S.W. wind and damp atmosphere may prevail on the first, second, or third day after each change of the moon, and a N.E. set in on the fourth or fifth day; here it might be said there is no perceptible addition to the moisture; why? because the addition is in mixture with a drier atmosphere. I believe the frequent remarks I have made of moisture occurring on the days I have noticed to be caused by the subsidence of the atmospheric great aerial tides, which have been attracted by the moon's influence, and which accompany her path round the globe, where some portion of warm equatorial air, loaded with vapour from those regions, subsides and rolls down towards the more polar parts of the earth. Whether I may be right or not in my conjecture I have no doubt of the fact.—*W., May 22, 1844.*"

"I beg to draw to your recollection the conversation I had with you some days ago. You asked my opinion of the weather. In reply, I said I expected an addition of moisture to the atmosphere on the following Tuesday and Wednesday, being the fourth and fifth days after the full moon, but that I would not positively assert that it would produce rain. To test my predicted addition of vapour on the day I have named, I tried the dew-point on Monday, and found it at 43°; on Tuesday, it rose to 49°; and this morning to 56°. It produced a slight fall of rain about 6 A.M., but so slight that it soon dried up; otherwise, had the surface of bare land, turnpike-roads, &c. been thoroughly wetted, the dew-point would probably have been above 60°. The barometer fell last night from 30.0 to 29.90.; but this last I consider, from long observation, a fair-weather point. Since 8 A.M. this morning, however, it has fallen to 29.88.; and should it continue to fall below 29.80., I should then have little doubt of an abundant fall of rain.—*W., June 5, 1844.*"

than six hours a day (I hope soon to introduce them to Lord Ashley.) When I took the honey, half the bees were taking their naps, and the officer bees were just relieving guard, so that very few knew it was gone; certainly only those that were wide awake. As a proof that I awoke some, you will find on the paper of the glass some thin waxen caps, such as bees ordinarily use for closing up their cells; but we must now believe them to be nightcaps. I do not recollect if the bees in the neighbourhood of Woolwich sleep in caps, but I am sure my bees do not sleep without caps; and in the confusion I had caused them, they had forgotten to put them away. Perhaps some correspondent will inform me whether they keep bees that sleep, and how, and when, and in what way—whether with their eyes open or shut. —*Mel.* [We and our honey-tasters, of whom several have been consulted, are of opinion that Mr. Mel's honey is perfection. No extract of Roses, Pinks, and Lilies could be better. Some of our apiarian friends will doubtless be curious to know what sort of citadel this six-pounder was taken from, and we hope Mr. Mel will tell us. Either Surrey or Cumberland might be proud of such a garrison.]

Bees.—Your correspondent "Apius," and the party with whom he has been arguing respecting the flowers resorted to by Bees, are, I have no doubt, both correct in their statements relative to the Polyanthus, the one maintaining that his Bees never touched these flowers, and the other that the inmates of his hives always resorted to them in the early part of the season. I am of opinion that there is a great variety of taste amongst the race of hive Bees in selecting the sources of obtaining nourishment for the support of life. In confirmation of this opinion, I may observe that I have a bed of Pansies, and another of Polyanthuses, commencing within one yard of the front of my hive, and although profusely covered with flowers, I never observed my Bees alight upon them for the purpose of collecting honey during the last or any part of the present season, the various species of the Humble Bee having been allowed to ravish their sweets undisturbed. On the 2d of May, from 5000 to 6000 Bees appearing in the side-box of my hive, with plenty of honey in the combs, and drones having become numerous amongst the Bees passing out and in, I thought I would endeavour to make an artificial swarm, by moving the side-box with its contents at night, and attaching it to an empty straw hive about three yards distant. I accordingly moved the box, and substituted an empty one to the parent hive; but the following morning, the Bees, with the exception of a few left as guards, returned to their original residence, and in the afternoon took possession of the empty side-box, the guards joining them in the evening. On the 4th of May the guards resumed their duty at the removed side-box, and in the afternoon the Bees commenced carrying propolis, and joined the side-box to the bottom-board, and if the cold north wind had not set in in the early part of the month I have every reason to believe my Bees would have swarmed in the usual manner, and taken possession of the residence I intended for them, which they may yet do when the weather becomes warmer. At present (May 28) the whole of my Bees have retired into the parent hive for warmth, although they have fine new combs formed this season, and a good supply of honey in their side-box. It is worthy of remark that, on the cold weather commencing, they extracted all the honey out of the combs in the removed side-box, and deposited it in their newly-furnished storehouse attached to the original hive. It was on the 3d and 4th of May, when the Bees on guard in the side-box were attacked by the Bees of a strange hive, and nobly repelled the invaders, killing upwards of 50 of their enemies, that I observed, when watching the movements of the strangers, that they searched my Pansies for honey (the Polyanthus having ceased flowering), and appeared as industrious and persevering on that flower as I have observed my Bees, when collecting their honey from the Crocuses, Columbines, and Canterbury Bells, and other favourite flowers of theirs growing in my garden; and I therefore naturally concluded that the Bees of particular hives are fond of and decidedly prefer particular flowers, and that both your correspondents might be fully justified in their observations regarding their respective industrious winged lancers.—*John Grant.*

Miscellaneous.—*R. A.*, a known correspondent states that, from a bed 5 feet wide and 14 feet 6 inches long, he cut 77 Cucumbers, between the 29th April and the 29th May, measuring in all 1173 inches in length. He remarks that the plants continue in good health, and promise to produce fruit through the whole season.

Societies.

HORTICULTURAL SOCIETY.

June 4.—Sir C. LEMON, Bart., M.P., in the chair. —Miss E. Holmes, and S. Lowdell, Esq., were elected fellows; and Dr. R. Wight, Dr. A. Gibson, Dr. H. J. Giraud, Dr. Riedel, Col. Sheil, Major Rawlinson, W. Griffith, Esq., and G. Gardner, Esq., corresponding members.—Among ORCHIDACEÆ were some remarkable things.—Mr. Rollisson obtained a Knightian Medal for a very fine new Aerides, from Bombay, something like A. crispum, but with branched inflorescence, and some bright purple spots on the petals; it will be named A. maculosum.—A specimen of the rare and curious Oncidium concolor, from W. C. Alston, Esq., of Birmingham, received a Banksian Medal. This remarkable plant has fine yellow flowers, of considerable size, and perfectly destitute of spots of any kind.—A good specimen of Oncidium pulvinatum was shown by Mr. A. Scott, gr. to Sir G. Staunton, Bart.—Finally, some glorious things came from Messrs. Loddiges, viz., the new Dendrobium Dalhousieanum, with the habit of D. calceolus, but with the labellum stained with a broad blotch of the richest velvety purple; a large mass of Cattleya Mossiæ, and the lovely Lælia majalis, that alpine species which, because it blooms in May on the Oaks of the Mexican highlands, bears among the flower-loving natives the name of *Flor de Maio*; to these a Knightian Medal was assigned.—Some very remarkable Stove and GREENHOUSE PLANTS decorated the tables, foremost among which was Epacris miniata, a most lovely new shrub from Messrs. Loddiges, with rich vermilion flowers like those of E. grandiflora; it was of Van Diemen's Land (Tasmannian) origin, and received the Large Silver Medal. Rivals of this were to be found in some rare plants from the Royal Botanical Garden at Kew, to which, however, by the desire of Sir William Hooker, no Medals were assigned; they consisted of Thunbergia chrysops, a new species from Sierra Leone, with large flowers of the most intense purple, enlivened by a golden-yellow eye; it will be a treasure to gardeners, and beats all the other Thunbergias hollow. Another was the Franciscea hydrangeæ-formis, a valuable stove shrub, from Brazil, with heads of fragrant violet blossoms; a third was the charming Gloxinia (or rather Gesnera) tubiflora, with long white trumpet-shaped blossoms, the colour of the richest cream; the latter is one of the best of modern greenhouse plants. The old, but beautiful Alpinia nutans, with flowers like white and yellow shells, came from the garden of W. Everett, Esq., of Enfield. And Mr. Glendinning, of the Nursery, Turnham Green, exhibited three seedling Gloxinias, with rose-coloured flowers. For two of them, with a charming mixture of white and deep rose, in well defined limits, the Banksian Medal was given; the third, a Self, was not included in the award.—Nor were FRUIT and VEGETABLES absent. Mr. Chapman sent some good British Queen Strawberries, and Mr. Fleming, gr. to His Grace the Duke of Sutherland, three handsome Cabul Melons, with the appearance of the Hoosainee; they were well grown, but as they were not to be tasted, their quality could not be ascertained. Mr. Fleming reported that they would have been far better had he not allowed them to set before his Vines were as strong as they should have been.—Mr. Fish, gr. to H. Oddie, Esq., of Barnet, produced a capital green-fleshed Melon, highly fragrant and weighing nearly 5 lbs., for which a certificate was given; and a bunch of Grapes that appeared to be quite new; the variety had been obtained by Mr. Fish, between the White Frontignan and Dutch Sweetwater, and exhibited the long narrow bunch of the former with the larger berries of the latter; when tasted it proved to have an agreeable Muscat taste, and was considered a good sort, well deserving the certificate that was allotted to it.—Finally, Mr. W. Dunsford sent from Mr. Everett's garden at Enfield, specimens of a new sort of Kidney Bean, the Dolichos sinensis, with young eatable pods, two feet long; they were described as being of an excellent quality when cooked like Kidney Beans, which is also the reputation they bear among Europeans in India; but to procure them they must be grown in heat (those exhibited were from the trellis of a Cucumber-house), and, therefore, the plant being a climber, and occupying a good deal of room, they could only be regarded in the light of a curiosity. —Among various things from the Garden of the Society, was a French watering-pot, for watering plants in sitting-rooms, or small thumb-pots, where great nicety in the application is required. It consisted of a hollow spindle-shaped tube, open at both points, one point being small, the other larger. When used, it is plunged into water, which drives all the air out; the thumb is then placed over the wider aperture, and the lower is presented to the plant that is to be watered; so long as the thumb is pressed upon the upper aperture, the weight of the atmosphere is kept off, and no water will run out; but as soon as the thumb is lifted up, a stream descends upon the plant, and will continue to do so till the thumb is replaced or the vessel is emptied. It was an ingenious adaptation of an old and well-known principle.

ROYAL BOTANIC SOCIETY OF LONDON.

June 4.—The second Exhibition took place at their garden, Inner Circle, Regent's Park. The plants, generally speaking, were in excellent condition. The Heaths were numerous, and attracted much attention; well-grown specimens of that beautiful tribe composing the greater part of some miscellaneous collections. Orchidaceous plants in general were not remarkable, few specimens exceeding mediocrity. There was, however, a beautiful plant of Barkeria spectabilis, covered with delicate lilac blossoms, from Mr. Brewster, gr. to Mrs. Wray of Cheltenham; a most beautiful dark variety of Stanhopea tigrina, having numerous pendent spikes of large flowers, from Mr. Robertson, gr. to Mrs. Lawrence; and a large specimen of Dendrobium densiflorum, finely in flower, from Mr. Mylam, gr. to S. Rucker, Esq. In addition to this, Mr. Mylam exhibited Aerides odoratum in wonderful health, Oncidium pubes, Epidendrum cochleatum, in good condition; Saccolabium guttatum, having four charming racemes of delicate purple blossoms; a small Oncidium Lanceanum, together with a well grown plant of Epidendrum crassifolium, the beautiful Phalænopsis amabilis, and Oncidium flexuosum. In the same collection were also Maxillaria vitellina, Stanhopea saccata, Aerides odoratum, producing a fine spike of bloom; Odontoglossum hastatum, a Brassia, and two Epidendrums.—Mr. Hunt, gr. to Miss Traill, sent good specimens of Maxillaria aromatica, Aerides odoratum, Oncidium luridum guttatum, Vanda Roxburghi, Calanthe veratrifolia, Oncidium Phillipsianum, having fine spikes of yellow and brown blossoms; Gongora atropurpurea, in excellent condition; together with Broughtonia sanguinea, Brassia Henchmanni, a pretty Stanhopea oculata, and a good Aerides odoratum.—From Mr. Barnes, gr. to G. W. Norman, Esq., were Stanhopea tigrina, S. insignis, and S. quadricornis; also Aerides odoratum, Vanda Roxburghi, and the handsome Cattleya Mossiæ.—Collections of Orchidaceæ were also supplied by Mr. Redding, gr. to Mrs. Marryatt, and G. F. Cox, Esq., of Stockwell.

Of Heaths, Mr. Barnes produced E. vestita alba, blooming profusely; a dwarf bushy E. ampullacea, E. depressa, well cultivated, and a beautiful E. perspicua nana, together with a large E. grandinosa covered with blossoms, E. mundula, E. Cavendishii, and a dwarf bushy E. tricolor. —Mr. May, gr. to E. Goodheart, Esq., Beckenham, sent a collection, comprising among others, Erica vestita, E. perspicua nana, in a lovely state; E. odora rosea, small but well-grown; E. propendens, well cultivated; the old E. splendens, and a large bush of E. daphnæflora; the handsome E. ventricosa alba, and a good E. hybrida. —In a group contributed by Mr. Bruce, gr. to B. Miller, Esq. was a fine Erica Cavendishii, small plants of E. splendens and tricolor, the beautiful E. ventricosa superba, the small neat-flowering E. Bergiana, and E. ventricosa coccinea minor.—Mr. Jackson, of Kingston, exhibited among others, Erica depressa, in fine condition; E. ventricosa breviflora, well grown; a fine specimen of a new E. tricolor, a well-grown E. elegans, together with E. vestita coccinea, E. inflata rubra (a beautiful variety), and a pretty E. Cavendishii. Mr. Jackson also showed a beautiful large seedling Heath, named E. Eassoniana.— Mr. Brazier, gr. to W. H. Storey, Esq., sent E. ventricosa alba, E. depressa (in excellent health), E. ventricosa superba (blooming profusely), fine plants of E. vestita alba, E. Cavendishii, and E. gelida, the latter covered with bloom. In Mr. Brazier's collection were also E. intermedia, E. floribunda and E. vestita purpurea, the latter very handsome.—The collection by Mr. Green, gr. to Sir E. Antrobus, Bart., contained beautiful specimens of E. perspicua nana and E. depressa; also E. intermedia, in excellent condition, and E. gelida, together with E. ventricosa superba, the beautiful small flowering E. propendens, E. ventricosa carnea, and E. dilecta.—An extra prize was awarded to J. Wells, Esq., Bromley, for four Heaths, in good condition.—Mr. Dawson, of Brixton Hill, showed E. perspicua nana, laden with flowers; also E. Massoni, the almost ever-flowering E. mutabilis, a fine E. prægnans, and E. odora rosea, well cultivated, together with E. Humeana, and E. depressa, the latter in excellent health.—In the collection sent by Mr. Frazer, of Leyton, was E. pendula, a well-managed E. ventricosa globosa, E. perspicua nana in a lovely state, and many other species equally well managed.—Mr. Brazier sent a collection of hybrid Vestitas in fine condition, in which were some good varieties, especially one named E. floribunda, having long pale-yellow blossoms.—Among single specimens of Heaths, there was a large well-grown E. depressa, particularly noticeable, from Messrs. Veitch and Son, of Exeter.—Mr. Fairbairn, of Clapham, contributed small but well-grown specimens of E. intermedia, E. tricolor in fine health, a beautiful ventricosa carnea, and other varieties of ventricosa, in equally good condition. Mr. Clarke, gr. to W. Block, Esq., exhibited E. dilecta, E. ventricosa superba, in profuse bloom; and a large E. vestita fulgida.—From Mr. Pawley, of Bromley, was Erica mundula, finely in bloom; a beautiful E. perspicua nana, E. vestita coccinea, E. depressa, in remarkable health; and several other species that equally indicated good management.

Of collections, that exhibited by Mr. Barnes contained many good specimens, and among others a thriving plant of Leschenaultia formosa, a fine Boronia denticulata, Aphelexis humilis, in good condition; Ixora coccinea, well managed; a good Rondeletia speciosa, Clerodendrum squamatum, large and fine; Leschenaultia biloba, producing its azure blossoms in abundance; together with Phœnocoma prolifera, and Aphelexis sesamoides, which was rich in blossom.—Mr. Hunt showed, among other plants, a beautiful Leschenaultia formosa, covered with bloom; a good Clerodendrum squamatum, a large Euphorbia splendens, a pretty Pimelea rosea, a fine plant of Ixora coccinea, together with a well-managed Gompholobium polymorphum, trained on a wire trellis; and a beautiful Pimelea decussata. In the same collection were Eutaxia myrtifolia, a beautiful Chorozema cordatum, Clerodendrum squamatum, in excellent health; a pretty Polygala cordifolia; also Oncidium flexuosum, a large Chorozema cordatum macrophyllum, and a good Russelia juncea.—Mr. Atlee sent Sprengelia incarnata, a large Boronia denticulata, Ixora coccinea, Polygala oppositifolia, in good condition; Epacris grandiflora, and a pretty plant of Genista rhodopnœa.—From Mr. Slowe, gr. to W. R. Baker, Esq., Bayfordbury, was a large Mimulus glutinosus, a fine Selago Gillii, Calanthe veratrifolia, producing several spikes of white blossoms; Cactus Jenkinsoni, in good condition; a well-grown Siphocampylus betulifolius, and a well-managed Hardenbergia longiracemosa. Mr. Slowe also exhibited Bossiæa linophylla, a large Vinca alba, Nerium splendens, and a seedling Calceolaria, about four feet high.—Mr. Green exhibited, among other plants, Gnidia pinifolia, a well-grown Chorozema Dicksoni, a tolerably good Dillwynia speciosa, a pretty Siphocampylus betulifolius, Stephanotus floribundus, trained on an upright circular trellis; Pimelea linifolia, a beautiful Azalea lateritia, Chilodia scutellaroides, a well-grown Lesche-

naultia biloba, in good condition; Azalea variegata, covered with blossom, and a beautiful large Coleonema rubra, in fine health.—From Mr. May was a collection, in which was Leschenaultia formosa, particularly good; a well-cultivated Ixora coccinea, pretty plants of Azalea variegata, and A. lateritia; a large Pimelea hispida, and a fine specimen of Cactus Ackermanni.—Mr. Bruce sent Aphelexis humilis, in fine condition; good plants of Oncidium flexuosum, Leschenaultia formosa, and Adenandra speciosa, together with Ixora coccinea, and a noble specimen of Pimelea spectabilis.—From Mr. Clarke was a pretty Gesnera splendens, Oncidium flexuosum, producing fine spikes of flowers; a large Euphorbia splendens, Abutilon striatum, trained over a wire trellis; a pretty plant of Fuchsia fulgens, and a small Aphelexis humilis, densely covered with flowers.—An extra prize was awarded to Mr. Taylor, gr. to J. Coster, Esq., for a good Siphocampylus betulifolius, a large Diplacus puniceus, and some Heaths.—Mr. Pawley sent, among other plants, Aphelexis sesamoides; well-grown Boronia viminea, covered with small pink blossoms; Gesnera reflexa, with large scarlet flowers; and a good Nerium splendens.—In Mr. Frazer's group was Philibertia Cunninghamii, covered with bright-yellow blossoms; a small Boronia serrulata, evincing good management; a good Epacris pulchella, a noble plant of Statice arborea, and a large Euthales macrophylla.—Mr. Catleugh had, among other plants, a beautiful Azalea called Fulgens Superba, with large, showy, bright-red blossoms; a good Azalea variegata, grown as a standard; Plumbago capensis, exceedingly well managed; a fine specimen of Fuchsia exoniensis, about five feet high; and a pretty plant of Cytisus canariensis.—Collections of *Climbing Plants* were shown by Mr. Green, Mr. Frazer, and some single specimens by other growers. Mr. Green's plants were Tropæolum azureum, trained on a wire trellis; a pretty T. tricolorum; T. edule, with pretty yellow flowers; and a good T. tricolorum grandiflorum. Mr. Frazer's were Sollya angustifolia; a beautiful Gompholobium versicolor, twining over a wire trellis; G. polymorphum, Hardenbergia longiracemosa, H. monophylla, exceedingly well managed, and a good Sollya heterophylla.—Collections of *Cacti* were contributed by Mr. Clarke, Mr. Green, and Mr. Upright, gr. to Mrs. Ridge. Mr. Clarke's group contained, among others, fine plants of Cereus Scottii, C. speciosissimus, C. Ackermanni, and C. speciosus.—Mr. Green showed a fine Cereus speciosissimus, a beautiful Epiphyllum speciosum, E. splendens, with very large bright scarlet flowers, and E. Ackermanni, in fine condition.—Mr. Upright sent a noble Epiphyllum speciosum; also E. Jenkinsoni and E. speciosum.—Among *New Plants*, Messrs. Veitch and Son showed Pentas carnea, Hindsia violacea, and Centrosema coccineum.—G. F. Cox, Esq., sent a specimen of Mimosa on a trellis.—From Messrs. Lane and Son was Hydrangea japonica. Of *Single Specimens* the following were the most remarkable, viz., an excellent Boronia serrulata, in great perfection; a large Pimelea spectabilis, in good condition, from Mr. Hunt; a beautiful large Ixora coccinea, from Mr. Barnes; a good Statice arborea, from Mr. Redding; and a Gesnera tubiflora, with long cream-white blossoms, from Messrs. Henderson, of Pine-apple-place.—Of *Roses* in pots, Mr. Dobson, gr. to Mr. Beck, showed well-grown plants of Madame Nerard, Comte de Paris, Armosa, William Jesse, Triomphe du Luxembuig, Charles Duval, Aubernon, Bourbon Queen, Bouquet de Flore, and Great Western.—The collection from Messrs. Lane and Son contained exceedingly well grown plants, which were remarkably clean and healthy. The varieties were *Tea*—Diana Vernon, very fine, Niphetos, Caroline, Elise Sauvage, Triomphe du Luxembourg, Devoniensis, La Pactole, and Princesse Marie. *Hybrid Perpetual*—General Allard, Aricie, and Louis-Bonaparte. *China*—Tabvier, Augustine Hersent, Napoleon, Miellez, Abbé Mide, and Eugéne Beauharnais. *Bourbon*—Armosa and Boulogne.—Messrs. Paul and Son, of Cheshunt, obtained a 2d prize for a collection of Roses in pots; they also sent cut specimens of Roses, as did also Mr. Milne, gr. to C. S. Chauncey, Esq., and some others.—From Mr. Dobson, was the larger variety of Oncidium ampliatum, and four species of Achimenes, in good condition.—Mr. Forrest, of Kensington, sent specimens of Martynia fragrans, and three plants of Statice macrophylla, in bloom.—Several groups of British Ferns were contributed; in that by Mr. Smith, gr. to J. Anderson, Esq., we noticed Hymenophyllum Wilsonii, H. Tunbridgense, Trichomanes brevisetum, and T. speciosum, as being rare species.

The *Pelargoniums* occupied a considerable space in the tents, and added much to the splendour of the scene by their gay and lively decorations.—Mr. Parker, gr. to J. H. Oughton, took the first prize in the Amateurs' class, for 12 plants admirably trained and bloomed; they consisted of Priory Queen, Lord Mayor, Comte de Paris, Rosalie, Hebe, Mrs. Stirling, Ovid, Master Humphry, Annette, Bleda, Jupiter, Grand Duke, and Prince Albert. The collection that had to contend with these was very inferior, from Mr. Bell, of Chelsea College; it received the second prize: Comte de Paris, Superb, Priory Queen, Coronation, Grand Duke, Enchantress, Una, Camilla, Erectum, Mrs. Stirling, Gem of the West, and Flash.—The contest in the *Nurserymen's Class* lay between Mr. Gaines and Mr. Catleugh, the former taking the first prize, for Juba, Albion, Pride of Surrey, Erectum, Mabel, Lady Sale, Arabella, Caroline, Comte de Paris, Lifeguardsman, Victory Superb, and Rising Sun. Mr. Catleugh's collection contained Dido, Flamingo, Hannah, Lord Mayor, Queen of Fairies, Coronation, Jessie, Tasso, Madeline, Nymph, Hebe, Prince of Waterloo, and Selina.—In the class composed of new and first-rate varieties, in pots of 24 to the cast, the 1st Prize for Amateurs was taken by Mr. Dobson, gr. to Mr. E. Beck, of Isleworth, for the following well-selected plants:—Luna, Conflagration, Flora, Evening Star, Erectum, Meteor, Dido, Leonora, Sir R. Peel, Susanna, Matilda, and Cleopatra.—Mr. Cock, of Chiswick, received the 2nd Prize for the following 12 finely trained plants:—Symmetry, Erectum, Emma, Hebe, Sapphire, Rachel, Tasso, Unit, Jubilee, Luna, Sylph, and Maid of Honour. The 3rd prize was obtained by Mr. Stains, Middlesex Place, Edgeware Road, for the following collection, grown in his peculiar style: Coronation, Jubilee, Witch, Vanguard, Beauty, Hebe, Rising Sun, Enchantress, Fair Maid of Devon, Ivanhoe, Superbum, and Duke of Cornwall.—In the *Nurserymen's Class*, Mr. Gaines took the 1st Prize with Clio, Pilot, Orange Perfection, Princess Royal, Hermione, Sir R. Peel, Spartan, Phyllis, Augusta, Rising Sun, Lady Prudhoe, and King of Beauties.—Mr. Catleugh was awarded the 2nd prize for Favourite, Luna, Laura, Rachel, Wizard, Unit, Nestor, Maid of Honour, Madeline, Rir R. Peel, Gypsey, Queen of Fairies.—In collections of 8 for Amateurs a 3rd prize was awarded to Mr. Slowe, gr. to W. R. Baker, Esq., for Annette, Amulet, Evadne, Beauty, Madeline, Bridesmaid, Proserpine, and Evelyne.—Mr. Henderson exhibited a large collection of *Calceolarias*, which were not sent for competition, containing the following sorts:—Queen of Beauties, Corymbiflora, Lady of the Lake, Meteor, Princess Royal, Magician, Milo, Andromache, Royal Standard, Sir R. Peel, Lady Constable, Grandiflora, Sunbeam, Bride, Modesty, Premier Peel, Speciosa. In collections of 8 the 1st Prize was awarded to Mr. Henderson (?) for Sir Robert Sale, Prince Albert, Fruticosa elegans, King, Magician, Lady Sale, Standishii, and Delicatissima; these were well bloomed.—The second collection was from Mr. Gaines, but these were evidently on the decline: Cyrus, Queen, Lady Elcho, Mag. grandiflora, Magnet, Sunbeam, Candidate, and Lady of the Lake.—The *Fuchsias* generally were attractive, although several of them had not attained their full growth, nor were they in full bloom. The 1st Prize was awarded to Mr. Catleugh, for Decora, Eppsii, Unknown, Cormackii, Conspicua arborea, Rosea alba, Monarch, Victorine, Hutchinsonii, Exoniensis, Majestica, Stormontii. 2nd Prize: Mr. Cole, gardener to G. Lewis, Esq., Excelsa, Eppsii, Britannia, Insignis, Defiance, Champion, Majestica, Gem, Curtisii, Venus Victrix, Brockmanni, Victorine.—Mr. Smith's collection, of Dalston, consisted of Gigantea, Modesta, Eclipse, Nimrod, Defiance, Alata, Mars, Coronet, Achilles, Magniflora, Vesta, and Floribunda.—An extra Prize was awarded to Mr. Gaines for his collection, for Gem, Decora, Champion, Conspicua, Moneypennii, Ilicifolia, Pulcherrima, Majestica, Rogersonii, Defiance, Enchantress, Britannia.—*Cinerarias*.—The 1st Prize was given to Mr. Taylor, gardener to J. Coster, Esq, for Rival King, Eclipse, Seedling, Dr. Dodd, King of Prussia, Youngii, Emperor, Delicata, Royal Blue, Carmina, Prince of Wales, Miss Emma. 2nd Prize: Mr. Catleugh, for Sinclairii, Enchantress, Violacea, Eclipse, Delicata, Napoleon, Wizard, Royal Blue, Splendida, King of Prussia, Youngii, Marie-Louise. 3rd Prize: Mr. Fairbairn, of Clapham, Decora, Delicata, Emperor, Carmina, Regulator, Enchantress, Regina Victoria, Royal Blue, Pride of Peckham, Splendida, Ceralia grandiflora, Alba purpurea.—Several Stands of *Heartsease* were exhibited; the 1st Prize was obtained by Mr. Brown, of Slough, for a fine stand of the following 36 varieties:—Brown's Prior, Orlando, Julia, Modesty, Morpheus, Curion, Black Bess, Charity, Mulatto, Target, Jeannette, Maid of the Mill, Warrior, Duchess of Beaufort, Eclipse, Success, Arethusa, Cotherstone, Viceroy, Fairy, Hannibal, Cyclops, Prospero, Thompson's Regulator, Sulphurea elegans, Exquisite, Cook's Prince Albert, Mulberry Superb, Hooper's Prince Albert, William Tell, Rufus, Fair Maid, Duchess of Richmond, Hale's Dark, Carpenter's Princess Royal, Bathonia. 2nd Prize: Mr. King; and extra Prizes to Messrs. Parsons and Wren.—SEEDLINGS.—*Seedling Pelargoniums* were exhibited by Mr. Whomes, gr. to E. Foster, Esq.; Mr. Dobson, gr. to Mr. E. Beck, Mr. Gaines, and Mr. Pamplin. Those selected for 2nd Class Prizes were:—Orion, and Miss Peel, exhibited by Mr. Whomes, and Hector, exhibited by Mr. Cock, Chiswick.—A Certificate was awarded to Mr. Smith, of Dalston, for the best Scarlet Geranium, named Eclipse; the same Prize was also obtained by Mr. Whomes for the nearest approach to scarlet in the Pelargonium, for one named Conflagration. A Certificate was awarded for a Seedling Fuchsia, named Princess Alice Maud, from Mr. Wright, gr. to the Hon. Mrs. Rushout, Wanstead.—A like Prize was awarded to a Seedling Calceolaria, named Guercim; and an Extra Prize for a Cineraria, named Eclipse, from Mr. Brining, of Stratford.—Mr. Baile, of Hammersmith, received the 1st Prize for scarlet Geraniums, for a variety named Globe Compactum.—Mr. Gaines exhibited a specimen Pelargonium, named Mabel; this plant was admirably grown and trained; the branches were brought down, and covered the top of the pot; the symmetry was perfect; it measured full 4½ feet in diameter, and the plant was regularly covered with large trusses of flowers.

Rebiews.

Monograph of Pelargoniums (*Monographie du Pélargonium*). By J. de Jonghe. 12mo. Brussels.

THIS is a little treatise of 144 pages, by a well-known enthusiastic writer on Gardening in Belgium, of whose talents we have occasionally availed ourselves. The object of the author is to give what he regards as the best mode of growing and propagating Pelargoniums in Flanders, to which he has added an extract from Loudon's "Encyclopædia of Plants," explaining the botanical classification of the species. M. de Jonghe does ample justice to the skill of English gardeners in managing this beautiful genus, and we have no doubt his work will be found useful by Amateurs.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BERBERIS TENUIFOLIA. Thin Ash-leaved Berberry. (*Greenhouse Shrub.*) Berberaceæ. Hexandria Monogynia.—This very rare plant was found by Mr. Hartweg, on his first arrival in Mexico, at a place called Zaquapam at the foot of Orizaba, and was raised among the first collections that he sent to the Horticultural Society. Considering the warm climate of which it is a native, it was expected to prove tender, and the event has shown it to be so; for we have no species yet in our gardens so impatient of cold. In fact, it must be regarded strictly as a greenhouse plant, to which any amount of heat would be fatal. It is a hard-wooded graceful plant, very apt to run up with a single stem, without producing lateral buds, unless that should happen to be broken off, when its beauty is much impaired. In that case, indeed, it remained in that state in the large collection of the Horticultural Society. At last, by binding it down, so as to check the rise of the sap, the lateral buds were enabled to expand, and now the specimen is well furnished with branches, and is above six feet high. Its flowers appear in the latter part of the year (October to December), and are agreeably sweet-scented. So far as experience has gone, it appears to be the most easily propagated by cuttings of the half ripe wood, or by grafting on the Mexican kinds. Per se it seems to like sandy loam and peat. *Nat. Ord. Mr. Hartweg.*—A Mexican plant from the eastern declivity of Orizaba, from the sugar farm of Zaquapam, at an elevation of 3000 feet above the sea, where it is found, though not very plentifully, in the outskirts of the woods bordering on the savannahs, attaining the height of ten feet.—*Botanical Register.*

SCHOMBURGKIA CRISPA. Crisp-flowered Schomburgkia. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—The yellow-brown flowers of this plant distinguish it from all the other species. In cultivation it demands the same treatment as many of the genus Cattleya. It may either be potted in turfy peat, in the usual way, or tied to a block of wood with a little sphagnum to retain moisture and suspended to a rafter in a stove. In any case, care should be taken not to water over-head when the plant is in a growing state, otherwise the glutinous substance on the scales which surround the young shoots will retain the water and cause them to damp off. In summer the plant should be slightly shaded, and the house kept as moist as possible at a temperature of 80° by day and about 65° at night. In winter, when little water is required, the temperature need not be raised above 56° by artificial means.—*Botanical Register.*

LONICERA DIVERSIFOLIA. Various-leaved Fly Honeysuckle. (*Hardy Shrub.*) Caprifoliaceæ. Pentandria Monogynia.—In many respects this Himalayan shrub is much like the common Fly Honeysuckle (L. Xylosteum); from which it principally differs in its flowers being nearly or quite stalkless and much larger. Dr. Wallich first received it from the mountains of Gurwhal, he afterwards procured it from Kabool, according to Dr. Royle, it is common on the mountains of the north of India. In a wild state it sometimes becomes small-leaved, and approaches the common Xylosteum, but its stalkless flowers still distinguish it. By some mistake it is included by De Candolle among his Nintooa, a set of climbing, 2-flowered species, which belong to the genus Caprifolium. This is a hardy moderate-sized shrub, which thrives in any good garden soil, and flowers during the months of May and June. It is easily increased by cuttings of the half ripe wood, if treated in the same way as those of the common Honeysuckle. It was raised from seeds received from Dr. Royle from the North of India.—*Botanical Register.*

Miscellaneous.

Seckel Pears on the Apple-stock.—At a late Exhibition of the Cincinnati Horticultural Society some very large and beautiful Seckel Pears were exhibited, grown on a tree grafted on the Apple. Specimens were also shown from the Crab-stock. The committee, in their report, state that those from the Apple-stock had the least flavour. In regard to appearance, however, no remark is made, and we are hence to infer that they were equally as beautiful as if grown on the Pear-stock. This high-flavoured Pear can afford to lose some of its aroma, if an equivalent is gained by large size. We should like to see the experiment fairly tested. All large and overgrown specimens of fruit have less of the true character of the variety than when they only attain to an average size; and perhaps large Seckel Pears from a tree on its own stock would be as deficient in flavour as those from the Apple. We would advise amateurs to institute experiments to test this. The only objection to the Seckel Pear is its small size. But if it can be grown to measure 6 or 8 inches in circumference on the Apple, and retain its good qualities, the fact should be generally known.—*Hovey's Magazine.*

Horehound.—The value of Marrubium vulgare (Horehound), in some cases of pulmonary disease has not been overlooked by old writers; nevertheless, it has been discarded very unjustly from the Pharmacopœia, while other substances of no utility, or at least of doubtful efficacy, have been retained and introduced. In the rural districts the Horehound has long been a popular remedy for coughs; and whenever the belief in any herb is found general, there are good grounds for presuming it possesses virtue. I have for many years been in the habit of employing the Horehound, in the subjoined form, in cases of troublesome chronic cough, particularly in that species which is found so frequently after attacks of influenza and other severe forms of cold, and have invariably found it has restored the tone of the stomach, and subdued irritation, after other more valued remedies have been employed in vain.

℞—Decoctum Marrubii	. . .	℥ vss.

Acid. Hydrocyan, L. P.	. .	℥ⱼ.
Syrup. Papaveris	. . .	℥ⱼⱼⱼ.

Misturæ sumat cochl. ampl. i. vel. ij. ter in die. The decoction is prepared by boiling four ounces of the recent plant in a pint-and-a-half of spring water, till reduced to half the quantity.—*W. H. Kittoe, M.D., in the Chemist.*

A Garden Poet.—We learn from a circular that Mr. Joseph Melony, gardener to W. F. L. Stone, Esq., of Tetsworth, is preparing for publication a volume of Poems, "for the benefit of a tender family."

CALENDAR OF OPERATIONS
For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

LARGE stoves are difficult to be kept sufficiently moist now that the doors and ventilators are to be kept longer open for ventilation. Among the contrivances to keep up more moisture, some growers throw fresh Moss loosely between the pots; and when this is done neatly, it looks pretty well; and after the Moss is well damped, it gives out a constant supply of moisture, to the great benefit of the plants. Give the plants as much room as possible by removing the hardier and less-esteemed sorts into vineries, &c. for two or three months.

Conservatory.—Mr. Wood's plan (see page 355) of planting out Fuchsias, &c. to be taken up in autumn to furnish the conservatory is an excellent practice, which cannot be too much enforced. This is about the right time to get out such plants. Leonotus leonurus thus treated will produce double the quantity of flowers that it would under pot-culture; the Brugmansias also do well in this way. Luculia gratissima delights in this treatment: but about the beginning of July will be time enough to plant it out. Pot Rhododendrons and Azaleas that are not vigorous, or that do not bloom freely, are often brought round to make fine specimens by being turned out in the same way; and lastly, Gardenia florida and radicans improve more under this system than any plants that I know; turn them out about the beginning of July in peat mixed with one-third of leaf-mould; and they need not be taken up until the appearance of frost in October; then let them be put in a close cold frame for wintering, whence they are brought to the forcing-pits in succession. Watering and training, with attention to shading, are the principal points to attend to now in this house; of course remove all flowering-plants as soon as the bloom begins to fade.

Greenhouse.—I do not recollect anything particular under this head that should be done in the meantime.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-Door Department.—While I am writing the rain is falling beautifully: and with a south-west wind, and a falling barometer, I think that our wants in this respect will soon be satisfied. Where the beds in the flower-garden were prepared for planting out, as directed some weeks past, it will be necessary, after the ground is properly moistened, to hoe them over, distribute the soil from the sides over the surface of the beds, and then regulate the plants for the season. Make good all failures, and in pegging the plants down, place them as much as possible with their heads pointing to the north, which will cause them to be drawn upright by the sun more effectually than if they were pegged out at random. Insects and caterpillars are becoming very numerous, therefore keep a sharp look-out, and frustrate all their attempts at colonisation. Ammoniacal liquor very much diluted is an excellent specific for most insects, but it requires to be used with great caution, or it will destroy the plants also. As the strength of gas water varies very much, it is impossible to give any proper directions for using it; but the most sure plan is to make the experiment of its strength on some worthless plant before using it for the general stock. Fresh planted trees will yet occasionally require a drenching of water, and plants on Grass may be watered by placing large flower-pots filled with water around them, with some gravel in the bottom of the pots, to allow the water to percolate slowly through it.—*W. P. A.*

III.—FLORISTS' FLOWERS.

As soon as the leaves of seedling Tulips become withered, take up the bulbs; great care must be observed not to injure them, as in most cases they push a bulb down several inches into the ground; let them dry gradually in the shade. *Ranunculuses.*—The buds should be frequently examined, as a green caterpillar, scarcely distinguishable from the stalk, often lodges just beneath them. They are also much infested with the Cuckoo-spit (*Cicada spumaria*), both which are seriously detrimental to the blooms. Where the flowers are sufficiently advanced, a light awning may be put over them. *Carnations.*—Still persevere in the extermination of the green fly, either by brushing off, or using Scotch snuff—puffing it on the buds by means of a small Indian-rubber bottle, with a tube in the neck. Take off laterals as they appear, and reduce the stems thrown up by strong-growing seedlings to one, so that the energy of the plant may be directed to the proper formation, and for the purpose of strengthening those buds which are left for blooming. *Pinks.*—If you examine the buds closely, you will find some attacked by a small gray grub, which eats its way through the lower part of the calyx, and devours the inside. We find the ravages of this insect more extensive in our collection this year than usual. If the buds are not reduced in number, let it be done immediately. An infusion of sheep manure will prove highly beneficial to the plants, by being poured on the surface of the bed occasionally. *Pansies.*—Continue to propagate by slips or cuttings, and all seedlings of inferior character, or which are not a decided improvement on the varieties already in cultivation, may be pulled up as they appear.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Where the renewing the beds with tan or leaves, and the repotting the plants, has not already been done, it is now time that it was. It is become a common practice to repot Pines at any season when they require it; and this is far the most rational practice; but as this is not yet the general plan, owing to the inconvenience of it in large establishments, where a great quantity of plants are grown in one pit, I may observe that in such places as the latter, now is a good time to go through the stock. Shading the newly-potted plants will be necessary. Keep the atmosphere as moist as possible during the day. In renewing the tan, care should be taken not to add too much, lest the heat become too great.

Vineries.—Where Grapes are ripening, keep a high temperature during the day, but at the same time a free circulation of air; and to admit of this, it will in dull weather be necessary to have recourse to heating the flues or boilers. Keep a constant look-out for the red spider, which will now be getting numerous if not checked. Thin the Grapes in the late houses. Remove partially the litter from the outside borders.

Peach-house.—The trees from which the crop has been gathered should be well syringed once a-day, and supplied with sufficient water to enable them to complete their growth. The trees in the second house will require to be kept free from insects, the shoots regularly tied in, and the borders properly supplied with water till the fruit begins to ripen, when syringing must be left off.

Fig house.—In the early house the second crop will now be advancing, and the trees will require to be well supplied with water, and to be regularly syringed.

Cherry-house.—The trees in pots and boxes, that have done bearing, should now be removed to a sheltered place in the open air. Give abundance of air to those planted within the house, and keep them free from insects.

Melons.—If the weather should become dull, renew the linings; and to do this the more readily, there should be some warm litter always in readiness. See that the fruit lays upon a dry surface, and keep the shoots thin.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Filberts.—Remove all suckers from the plants as they appear, examine the young fruit, and look after caterpillars, as they are making sad havoc in some places. *Currants and Gooseberries.*—Shorten and remove the summer's wood in the manner recommended for fruit-trees lately. Allow the leading shoots to grow a fortnight or three weeks longer before stopping them; the result will be superior fruit, finer swelled and better ripened buds for next season. *Peaches and Apricots.*—Give the fruit its final thinning, nail the young shoots close to the wall, leaving no more than can be fully exposed to light, recollecting that now and not next spring is the period for removing all superabundant shoots. Water and mulch the borders where necessary; as, if now allowed to become dry, and a wet autumn should succeed, we may expect gummy and cankered wood next spring. *Strawberries.*—Water if possible the forward crops, and tie up the fruit-stems to small twigs, which will improve the fruit in size and flavour.

Sow *Cape and Grange's Broccoli*, and any other sorts; Cabbage, Savoys, Scotch Kale, &c., for succession; Marrow Peas and garden Beans for about the last time, and a good breadth of Cauliflower for late autumn use. Water the ground after sowing, and cover with hurdles or mats. *Routine.*—Keep the water barrel in exercise, stir the soil among all growing crops, and keep the borders and walks neat and clean.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—After the bark season is over and the woods are cleared of the timber, loose branches, &c. there will be little to do for some time.

Coppice.—When these are cleared of all the stuff cut during the winter and spring, and the fences put in good repair, they should be gone over occasionally for the purpose of summer pruning, training, and regulating the young shoots of the present and previous year's growth.

Young Plantations.—Great attention should still be paid to those planted during the last season; keep alive as many as possible, by cutting them in or heading them down; water and shade all that can be done conveniently.

Nursery Work.—Watchfulness and care are still necessary during the present dry parching weather; shade, water, &c. or great losses will be sustained; do not omit the summer training and regulation of the young strong shoots; pinch off a part of some, and rub others off by the finger and thumb; gather Elm seed as it ripens.—*W.B.*

State of the Weather near London for the week ending June 6, 1844, as observed at the Horticultural Garden, Chiswick.

May		Moon's Age.	Barometer. Max	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain

The highest temperature during the above period occurred on the 12th and 13th, 1842—therm. 90°; and the lowest on the 9th, 1838—therm. 35°.

Notices to Correspondents.

BOOKS.—*Killough.*—If you want to know how to conduct chemical analyses in agriculture, you had better procure Johnson's "Lectures on Agricultural Chemistry."

CUTTINGS.—*Know Nothing.*—We cannot go into a long story about the way to strike cuttings in general. From time to time you get special information upon the subject, and to that we must refer you, or to the "Theory of Horticulture." At the same time, we may perhaps promise hereafter to say something on the subject, useful to "Know Nothing." Full information about the management of Pelargoniums will be found in our volume for 1841, and we shall almost immediately publish the French way of managing such plants. Do not shift your Pelargoniums now. It will be quite time enough before they begin to grow next year. They ought to have been turned out by this time, if they are to flower in the borders during autumn. If you give them too much water you will be very likely to get the "spot." It is a bad plan to fill their pans with water, unless they have to grow for some time in the hot sunshine.

GARDENS.—*A Constant Reader.*—As far as we can judge of your case, a geometrical garden would be suitable. If this sort of arrangement is well managed, nothing is prettier; but it requires much taste in the design and the greatest neatness in keeping it. It should, moreover, be assisted by vases, statues, or some such objects, in order to produce the best possible effect. All such gardens should be surrounded with shrubs and trees, which give the requisite finish to their boundary.

HEATING.—*An Inquirer.*—A Stephenson's boiler will do, and if you burn coke you will make little smoke. For price, &c., you must apply to the vendors. If your Salisburia does not grow, the soil must be in fault; give its roots a little fresh loam, without manure.

INSECTS.—*Bernard Saunders.*—I cannot discover the least vestige of an aphis, or any other insect, upon your leaves; and, being unacquainted with the disease, I am unable to help you. The punctures look like those of a Curculio. *R.*——*P. T.*—Your bees are a species of Halictus, possibly the females of H. flavipes; but the specimens are discoloured by grease secreted in their bodies, which prevents me deciding with certainty. Such bees form their cells in the earth; and the history of all the species is admirably given in Kirby's "Monographia Apum Angliæ." *R.*——*Alpha.*—Your insects are the sexes of Aleyrodes Phillyreæ of Curtis's Guide Gen., 1044. 1. The scorpion-like animal is a Chelifer, which lives upon mites and minute insects. *R.*

LIABILITY.—*A Poor Widow.*—The widow who takes the goods of her deceased husband is liable to pay his funeral expenses and debts to the extent of the value of the goods so taken.—*W.*

MORPHOLOGY.—*J. F. D.*—Your Centaurea offers an excellent illustration of this subject. All the scales that form its involucrum are leaves capable of producing buds in their axils; but in general they do not produce them. Here, however, the natural tendency is resumed, and young branches have sprouted from the axils of many of the scales. The "Hen and Chickens" Daisy is an analogous case, but is not so striking as this of yours.

NAMES OF PLANTS.—*Zephyrus.*—Isatis tinctoria.——*W.*—Some Gypsophila, and apparently G. repens.——Γεωργος.—Tourretia lappacea. We find Humphreys's Compound so strong that the less of it which is applied appears to be the better.——*J. S. W.*—Some Plectranthus; but who shall say which, from such a fragment! Gardenia tetrasperma is a dwarf Indian plant, with greenish-white flowers. This is all we know about it.—*Henry Cottrell.*—The chapter on Nomenclature and Terminology, in Lindley's "Introduction to Botany," will give you the information you desire.——*B. T. S.*—Geranium disectum, and Columbinum.——*A. H.*—Orchis latifolia and militaris are perfectly distinct species. We know nothing of Cypripedium bulbosum.——*A. S.*—Some say that the Shamrock is White Clover; but the more probable opinion is that the Wood-Sorrel is the plant intended, and we think so. What you have sent is neither one nor the other, but Trifolium minus.

ORANGE-TREES.—*Citrus.*—Repot your miserable Orange-tree in very rich soil, containing one third of charcoal; cut it well in, and give it a smart bottom-heat, if you can.

STRAWBERRIES.—*J. Halley.*—Unless your seedling improves very much it will be worthless. The flavour is not good, it is far too acid, and the specimens are ugliness itself.

SYCAMORE TREE.—*A. P.*—Although the old bark of this tree is always dying and cracking, there is plenty of living bark below it. There is no objection to your scraping off all the old cracked bark if you think it worth while, provided you only remove that which is loose. It is better not to tear off that which still adheres to the living matter beneath it. Now is the right time for the operation.

THE GOLDEN PIPPIN.—*W. T. B.*—It is too true that the Golden Pippin is becoming extinct, and that very many old trees are perishing, so that from natural causes the perpetuation of this variety by grafting is impracticable. But there is no probability that, by protecting the blossoms from the promiscuous inoculation of bees, and the pollen transferred by hand, the seed so obtained would insure the reproduction of exactly the same variety of Apple.

MISCELLANEOUS.—*M. H.*—If your fruit is at 21, Regent-street, by 7 o'clock, P.M. (not later), it will be taken to the gardens on the same evening.‡——*Fidget.*—We really do not possess the gift of prophecy; and, with due submission, we see no kind of advantage in speculating about what *may* happen. All such guesses as you would have us make are better indulged in by each man for himself. In our own neighbourhood there is plenty of fruit, and all such good things, with a fair prospect for everything but Strawberries. Very likely your neighbourhood will tell a different tale.——*Kitty.*—By means of a Papin's digester, a temperature considerably above 400° Fahr. has been obtained.——*G. Plumbley.*—It is *not necessary* to be an exhibitor, in order to gain admission early in the morning to the Chiswick Shows; but it *is* necessary to be a gardener.——*Falcon.*—We really must beg pardon for our tardiness. Your note is waiting to be made the subject of a Leading Article; for the nature of it will not admit of its being answered briefly.——*Cymw.*—Mosses, when dried between paper, change their colour very little. We do not comprehend what difficulty you can have with them. Certainly no preparation is necessary, beyond that of gathering them when dry.

SEEDLING FLORISTS' FLOWERS.

CACTUS.—*A Constant Reader.*—Your seedling is rich in colour, and appears to be a slight improvement upon Jenkinsonii. These are flowers we see under great disadvantages, as they seldom reach us till they have closed, and consequently they are not seen in perfection.*

CALCEOLARIAS.—*A Constant Reader.*—Your seedling is a clear bright flower, prettily spotted in front; and the stripes inside the throat improve its appearance; the form is too indented at the bottom.*——*S. H. P.*—Your seedlings did not reach us in a state to enable us to judge of their merits.*——*A. B.*—Your collections of seedlings are very pretty, and very varied in their colour, and in their spots and blotches; but they differ very little from those we are in the habit of seeing. Nos. 1 and 3 are the most distinct.*——*I. H. C.*—The yellow seedling, with blotch in front, is a bold and well-shaped flower. The striped seedling is a very distinct variety, and though not good in form, is the only one we have seen that deserves to be so called; there are a dozen full-blown flowers on the branches sent, every one of which is more or less distinctly striped with bright brown, upon a yellow ground.*

FUCHSIAS.—*I. N. Y.*—A hybrid between F. cordifolia and corymbiflora, and is thus described:—"The plant is nearly five feet high, of vigorous and luxuriant growth, profusely clothed with fine foliage, producing flowers on every branch, about 50 in number." The flowers very much resemble those of F. splendens; they are about 2¼ inches long, and it appears to blossom freely at the ends of the branches; it is impossible to form an opinion of the general appearance of the plant without seeing it.*——*R. F.*—The dark seedling is a fine showy variety, but it possesses no novelty, and is so like several that we have, that it is difficult to distinguish them. The sepals are disproportionately long in both varieties, and do not appear to expand freely. The light variety is the best, as it is the largest of its colour we have yet seen.*

PANSIES.—*I. B.*—None of your seedlings are worth preserving.*——*A Constant Reader.*—Your seedling is a well-formed flower, with good eye; the colour at the edge of the top petals is a defect, as it appears like a stain; and these petals also are rather too high: it is a good flower, but not equal to the best now to be seen in stands.*——*Borealis.*—Ebor is a fine seedling; good form, and firm in texture; eye fine, ground pure, and colours brilliant. The marginal colour is rather weak where the petals meet above the eye, and the edges to the petals want greater smoothness.*——*J. S.*—Your white variety is inferior to many of our flowers; it wants substance. 2 is intensely dark, and quite of a velvety character; it would have been an improvement had the side petals extended a little higher. It is, however, a very fine self.*——*D. D.*—Having examined your seedlings, we find them deficient in the qualities of show-flowers, as they want size, texture, substance, and marking; the best in the collection are a white self, No. 2, and a Primrose-self marked *b*; these are worth trying again. They appear to have more substance than light selfs generally possess.*——*An Amateur.*—Josephine is the most desirable flower; it is a rich bright yellow self, good in form, and of fair substance. No. 1, large purple flower, of velvety texture, the defect of which is the weakness of the ground colour in the side petals, and the want of the blotch in each of these petals to give decision to the eye. The notch in the bottom petal of No. 2 is a great defect: in other respects, it must be considered a large, fine, and bold flower.*——*Borealis.*—Ebor agrees with the description previously given. Aurora is a pleasing novelty, white ground, large dark blue eye, with decided blotches on the top petals, of a light blue purple. No. 3 is a flower of great brilliancy, but the form is not good, nor are the edges of the petals sufficiently smooth.*——*I. H. C.*—Your seedling, neat and pretty as it is, wants form and size.*

PELARGONIUMS.—*T. H.*—The petals of your flower were all loose; it appears to be a large, showy flower, very much resembling *Garth's Witch*, and is worth keeping.*——*E. J. L.*—The petals of your flowers were shaken from their stalks; and from their shape, *Marianne* must want form very much, both the upper and lower petals being too long. *Flora Mac Ivor* is a very pretty seedling, and is very superior to the other in form, colour, and substance.*——*J. W.*—Your seedling is common in colour and general appearance; we have many in the same way larger and better.*——*J. D. P.*—No. 1 common in colour, and wanting in form and substance: 2, too veiny, and no improvement upon sorts similar in character: 3, deficient in form and substance, and common in colour: 4, pure white, with plum-coloured spot; your best flower, but deficient in form, and not equal to the whites already in cultivation: 5, deficient in form and substance: 6, very bad: 7, good top petals, lower narrow and long; they are all very second-rate flowers.*——*E. T.*—The Pelargonium is of no value whatever; it possesses neither form, size, nor substance.*

PETUNIAS.—*E. J. L.*—Your seedling the *Comet* is a very common flower.*——*J. W.*—Your seedling No. 1 is pretty in colour and good in form, without its having anything particularly attractive about it.*

ERRATUM.—Page 356, line 48, col. *b*, for "fig. 2," read "fig. 4."

TO BE SOLD BY PRIVATE CONTRACT.—A SMALL TITHE-FREE FARM, of 120 Acres, in a ring-fence, in Huntingdonshire, in first-rate condition, with a neat Farming Bailiff's COTTAGE, and ample Barn and Farm Buildings, standing in the centre of the Farm.

If bought for an investment, it shall be sold to pay net four per cent. interest from a responsible Tenant; if for occupation, possession may be had previous to harvest, if desired.—Further particulars may be had from Mr. LAWRANCE, Solicitor, Peterborough.

The Agricultural Gazette.

SATURDAY, JUNE 8, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 12 Agricultural Society of England.
THURSDAY, June 13 Agricultural Imp. Soc. of Ireland.

WEDNESDAY, June 19 Agricultural Society of England.
THURSDAY, June 20 Agricultural Imp. Soc. of Ireland.

"THERE IS DEATH IN THE POT!" exclaimed the ingenious Mr. Accum, some thirty years ago, and he straightway frightened half the nation into the belief that all the good things they had been eating for years were poison. Would that a new Accum would arise and warn the farmers that "there is a thief in the sack;" for, they may depend upon it, a monstrous deal of what they buy is roguery in disguise. When we touched upon this matter a few weeks since, we showed that in the opinion of some of the worthy gentlemen who deal in manures, *anything is good enough for a farmer*, who is considered by them to be fit for nothing but for plucking.

We did not anticipate another flagrant case of fraud so soon; but a known correspondent has warned us (see p. 364) that people are at this moment selling at Hull, under the name of pure and unadulterated Bone Ash, a villanous preparation of pounded limestone. Farmers are urged to buy this stuff for drilling with their Turnip-seed; for Bone Ash is admitted on all hands to be invaluable as a means of starting the young Turnip quickly into growth; and the honest gentlemen at Hull are so kind as to prepare it specially for use. We know nothing more remarkable than the patriotism of these dealers. Not contented with offering Bone Ash for sale at the moderate price of 90*s.* per ton, they particularly warn their customers that what *they* sell is pure and unadulterated. Five bushels of Bone Ash to ninety-five bushels of pounded limestone is what constitutes a pure article, according to the conscience of a dealer at Hull. We are curious to know what, in such honest people's minds, adulteration really is. Perhaps they claim credit for putting any Bone Ash at all into their mixture; and think the limestone the better substance of the two. To be sure 90*s.* per ton for limestone is rather dear, but what does that signify to a farmer?

We cannot but congratulate our Yorkshire friends upon the advantageous market at which they make their purchases.

We heartily wish we could add that the above is the only case of scandalous fraud that has lately come within our knowledge. A young friend, however, well known for his zeal and scientific acquirements, has just put into our hands the following details, which we do hope will open the eyes of farmers to their true interests, and assist in preventing them from being any longer swindled out of their money and their crops.

A Cheshire farmer, who was recommended to use only a cwt. of ground bones per acre, exclaimed, "A hundred weight! why the least that I can dress my land with is a ton and a half; and that only lasts for four years." "My good friend," said our correspondent, "such a dressing as that ought to last for twenty years; let me look at this bone-dust of yours." A sample was produced, analysed, and found to contain *eighty-five per cent. of carbonate of lime*, or chalk. And this, too, in Cheshire, where bones are the salvation of the old pastures. Here the farmer had been paying 10*l.* for every thirty shillings' worth of his manure; and perhaps seven per cent. interest upon the 10*l.* What can the Cheshire gentlemen be about to stand this?

But bone-dust is also mixed with gypsum, twenty-four per cent. of which has been found in samples, also from Cheshire. In other cases the weight has been increased by soaking bones in water, to the extent of fifteen to thirty-five per cent. It is certainly very obliging of the dealers to give the West-country farmers *seven hundred weight of water with every ton of bone-dust.*

We have already asserted that guano is often an abominable mixture of all sorts of brown ingredients that are worthless. Here is the analysis of some, which a near-sighted gentleman purchased at 12*l.* a ton. It contained *one half per cent.* of ammonia, *not a trace* of urea, *minute quantities* of alkaline sulphates and phosphate of lime; in short, the largest estimate that could be made of the real guano present in the sample amounted to *three per cent.*, including feathers, which, however, appeared to have belonged to sparrows and pheasants. On the other hand, there were fifty per cent. of stones and yellow earth. In this case the buyer was near-sighted indeed, for his guano cost him *nearly four hundred pounds a ton.* These must be famous times for farmers, when manure can be bought at such a price.

And these are not solitary cases. A guano sold at Manchester has been found to contain *seventy-five per cent. of brickdust;* another sort from Derbyshire contained *ten per cent. of sawdust and six per cent. of clay*; and another Derbyshire specimen was doctored with *ground bark* to the extent of *twelve per cent.*

Really, with such facts staring us in the face at every turn of the road, it is most incomprehensible why farmers will not throw themselves into the arms of the chemists, who alone can help them. We are urged to publish the names of the people who are swindling the country in this manner. Perhaps we may. But that will never abate such enormous evils as we have now described. Farmers *must* look to themselves, and get their manures analysed before they buy them, or they must purchase under warranty, as they do with their horses.

ON THE TENDENCIES OF THE ALLOTMENT SYSTEM.

I CANNOT help thinking that the sentence which has been of late much before the public—"Property has its duties as well as its rights"—conveys a sentiment which, while it is true of all stations in life, is especially so in its reference to *occupiers* of land; they, as well as their landlords, have very important duties to discharge as well as rights to enjoy. It appears to me, that among the former is the fulfilment of a claim which is naturally preferred by all who have been bred to an agricultural life—a claim to live by agricultural labour.

Though I do not mean to encumber your columns with a proof of the fact, yet it is certainly demonstrable that land under the plough will yield a profitable return for a much higher degree of cultivation than what a great deal of it now receives; and, in such districts, were the sums now paid as poor-rates spent in the employment of labourers in the ordinary acts of cultivation, or in drainage, &c., that which is now paid away as a dead loss to the country would be amongst the most profitable items of the farmer's invested capital. There are many who differ with me on this head, but to them as well as to others the labourers of our parishes look for support; the law countenances them in this claim, and the alternative which is placed before farmers is thus a very simple one—they must support paupers in the workhouse, or grant them the means of supporting themselves out of it. Of what great national consequence it is that a right choice should here be made, we can hardly conceive. The adoption of either of these systems as a commencement tends to strengthen and increase the chance of its continuance; the action of each is conservative of the principles on which the continuance of each depends. The tendency of a system which provides labour for all is to beget an independent spirit in the labouring classes—a pride above being dependent on others for support; and that of a pauper system is necessarily to beget a listless acquiescence in a state of dependent idleness.

Besides the door which the evident profitableness in many districts of a higher degree of cultivation opens for agricultural labour, and thus for diminishing an expensive and most injurious pauperism, there is for those with whom the present outlay of capital in cultivation is a maximum, either from necessity or from an opinion of expediency—there is for such, another means of diminishing poor-rates, and of imparting the healthful spirit of independence to our labourers, which follows sufficient employment. I allude to the allotment system, which, as a mode of bettering the condition of the Agricultural labourer, is now occupying so much of public attention. The county of Worcester has been the first to take up this subject in a public manner. At a large meeting of the county gentlemen, lately held, a committee was named who are busily engaged in arranging a course of operation, by which it is proposed to bring the whole of the county under the influence of this system. Worcestershire is being divided into districts, in which sub-committees are being formed for the purpose of supplying information, &c., which may enable the central committee to direct their efforts efficiently.

As an instance of the influence of allotting small portions of land for spade culture to Agricultural labourers, allow me to bring under the notice of your readers the following extract from the *Worcester Journal*, being a portion of a letter from the Rev. H. P. Jeston to J. Fardon, Esq., of Bromsgrove:—

"Cholesbury is a very small parish, containing 112 acres of cultivated and 44 of uninclosed common land. The population is under 150. My acquaintance with it began in 1830, at which time it was almost exclusively a parish of paupers. The poor rates for the 10 years preceding had averaged 170*l.*, and in 1831 they exceeded 200*l.* The rates (for all purposes) exceeded 30*s.* in the pound.

"In consequence of the excessive burden on the land, the whole of it, except eight acres, was in 1832 forced out of cultivation, and was abandoned by landlord and tenant; the gates of the several farms were taken down, and the fences suffered to remain unrepaired, in order that the owners of property might avoid being rated. There being no longer beneficial occupation, the overseers threw up their books, and the poor were maintained for more than half a year by rates levied on other parishes in the hundred. For many years my predecessor had made no attempt to collect his tithes, the rates upon them far exceeding their value. The glebe land at length became valueless. I was all but starved out of the parish; I had in fact made preparations for leaving it, both on account of my family, as well as to escape the sight of wretchedness which it was in my power no longer to relieve.

"Just at this time the Agricultural Employment Institution, hearing of the destitute state of the parish, purchased in it about 50 acres of arable and wood land; the former (36 acres) they allotted to eight or ten married men with families, in quantities varying from two to four acres, and an acre each to four or five lads. The 36 acres are now all occupied by married men; the rent is 23*s.* per acre, and is paid punctually. The tenants also contribute their quota of all parochial taxation. The good effected by this system has exceeded my expectations, though from the first I anticipated great things from it. In 1831 the money expended on the poor exceeded, as I have already stated, 200*l.* In 1842 it did not amount to 20*l.*

"In 1831 the total number of poor in receipt of parochial relief, and that during the whole of the winter months, was as follows:—

Married men with families	8
The wives and children of the above	28
Single men and boys	12
Aged and impotent	15
Total	63

In 1842 there received relief—

Able-bodied poor	0
Aged and impotent	3
Total	3

"A lunatic in the Peckham Asylum is costing the parish a two shilling rate (26*l.*) in the year. Were it not for this charge, our poor would not cost us 20*l.* a year; in fact, we have not, and have not had for ten years, one able-bodied pauper belonging to the parish. The allotment system has cured that evil. The poor-rates have averaged, these last three years, 4*s.* in the pound.

"The allotment men work for the farmers in the surrounding parishes whenever they can get a job, but it is very seldom their luck to meet with one. Two or three of them are owners of a horse and cart each, and during the winter months they in part maintain themselves by carting flints and firewood from our hills to the neighbouring towns. All the men have pigs, and in summer three or four of them keep also a cow.

"The conduct of the men since they have had allotments has been such as to afford me very great satisfaction. Not one of them has been summoned before a magistrate for any offence these ten years; they are punctual in their attendance at church; they and their wives, and every child old enough to attend the Sunday School, are members of a Clothing Club, and deposit in my hands during the year as much as from 30*l.* to 40*l.*, which is expended at Christmas in clothing; the consequence is, there is not a ragged or ill-dressed person in the parish.

"It is not only the agricultural poor that have been benefited by the allotment system, as carried out in this parish. The owners of property have also equally reaped the advantage of it. The 36 acres now occupied by the allotment men at 26*s.* per acre was let in 1831 for 23*l.* (something under 13*s.* an acre); and a tenant could then be found bold enough to take it only by the landlord guaranteeing to pay all rates above a certain amount. The result of this agreement was a curious one; when rent day came it was ascertained that the rates had so far exceeded the rent that the landlord found himself in debt to his tenant, and the latter returned from the audit with more cash in his pocket than he brought to it. The other property in the parish has also recovered its just value.

"You state that you feel much interested in the allotment system, and that you are about to try it in your own parish. If the land allotted be near the dwelling of the occupiers, and the letting not clogged with many rules or restrictions, I have no doubt of your success. You will soon find yourself surrounded by a grateful and affectionate tenantry."

This is an extreme case: it appears both landlord and tenant had abandoned the land. Under ordinary circumstances it is by no means desirable that such large portions of land as were here allotted should be let to labouring men: it is not wished that they should have enough to support them as farmers, independently of the wages derived from ordinary agricultural labour. A quarter of an acre, or, where a man has a large family, perhaps rather more, is amply sufficient for the purpose to which it is to be applied; viz., to support labourers at periods when labour is scarce—to keep them from the evil influence of idleness during those periods, and to supply them with labour of a kind the most beneficial to them, because it keeps them *at home*, and its results are *their own*. We cannot speak more justly or highly of the tendencies of the allotment system, *where it is properly regulated*, than in the words of Mr. Colman, the celebrated American agriculturist, who is now in England, and engaged in reporting the condition of British agriculture to his countrymen. He says:—"I have treated largely on the subject of allotments, as presenting one of the first and most effective means of bettering the condition of the agricultural labourer. My own convictions are strong on this point; and they are sustained and strengthened by the testimony of many men of large ex-

perience and shrewd observation. The labourer finds in an allotment a means of turning his spare hours to advantage, and in a mode of labour which, from its very character, being in the association of his wife and children, under his own control and management, and for his own immediate and personal benefit, becomes a benefit instead of a toil. He finds it the means of eking out his scanty wages, of providing to a degree for an occasion of sickness or other suspension from his employment, and wages. He is enabled to bring from this source many rare comforts to his frugal table; and has himself, if he is a man of feeling—and why should he not be?—an opportunity of enjoying one of the richest of all pleasures, that of making a small contribution to relieve an unfortunate or a sick neighbour. *It presents a good school of industry for his children, under his own immediate inspection.* It quickens his own intelligence, in making agricultural experiments upon a small and useful scale; and rouses a spirit of wholesome emulation in his crops, even with the master farmers. It removes him from strong temptations to gambling, low dissipation, and intemperance. It gives him an interest in the soil; it attaches him to his home; it involves him in all the risks of the public safety, and makes him the friend of public peace and order. It gives him the spirit of a man, raising him above the sense of slavish dependence, and the dread of becoming a pensioner on public charity. In so doing, it at once exalts him in the community; induces a most wholesome self-respect; inspires a just regard for the rights of property; attaches him the more strongly to his superior."—*M. S.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Drainage.—The peculiar features of East Lothian farming are,—1st. The removal of superfluous moisture from the land by draining; 2d. The thorough eradication of weeds; and, 3d. The preservation of the soil unexhausted, by means of a liberal application of manures, and the general prevalency of the alternate system of cropping: or, in other words, the great leading principles of farm-management assiduously aimed at by every good farmer in this county, are the keeping of his land dry, clean, and in good heart—to use a common but significant expression. Although these primary or fundamental principles of agricultural improvement may be said to stand or fall together, yet draining is universally considered as the first in point of importance, being justly regarded as the basis of all good farming. Draining is one of those means of improvement, regarding the utility of which all practical men are now unanimous. In a previous Number of these Papers it has been stated that the general character of the soil throughout this county is a strong, stiff, tenacious clay, for the most part incumbent on a hard impervious till; from which it will obviously appear that there are few districts in which draining is more requisite, or in which its effects are more apparent and beneficial. It requires no arguments to prove—indeed it is generally admitted—that draining has been the first decisive step towards that improved system of tillage-husbandry for which East Lothian is now deservedly celebrated.

It is only within the last ten or twelve years, however, that the present system of thorough draining or furrow-draining, as it is here more frequently termed, began to be practised to any considerable extent. Before that period, even the most correct and spirited agriculturists contented themselves with the old plan of cutting large cross trenches, or drains, varying from 3 ft. to 7 ft. in depth, through the hollow or low parts of their wet fields, in order to intercept and convey to the nearest convenient channel the water issuing from subterraneous springs or spouts. These large transverse drains, combined with what are provincially called gau-furrows (small open drains, or water-furrows, made through the hollows, and at the headlands, for carrying off surface-water), were previously considered to be the only effectual means at the farmer's command for the removal of superfluous moisture, from whatever causes such wetness might proceed. The consequence of course was, that much land, now perhaps the most valuable in the county, remained in a very wet and comparatively unproductive state; whilst the strong arable land became always so thoroughly saturated with water, after a few days' rain, that ploughing, and other tillage operations, had necessarily to be suspended for weeks together. Furrow-draining having been, like all new improvements, regarded as an innovation on established usage, was very cautiously and diffidently adopted at first; but its simplicity, efficacy, and superiority over the old system soon became apparent and duly appreciated. The immediate and ample remuneration it afforded also naturally excited the self-interest of a wealthy and spirited tenantry, who speedily set about the complete drainage of the wet portions of their farms with all the assiduity and confidence of commercial speculators. A large amount of money has consequently been invested, and is still expending on draining. A considerable extent of the county has been already thoroughly drained, but much still remains to be similarly rescued from the deteriorating influence of an excess of moisture.

The extension of draining in this county is mainly attributable to the ample capital possessed by the farmers, and to the comparative security of the tenure on which they hold possession. Unquestionably furrow-draining has had the effect of bringing much land, previously regarded as mere waste, into profitable cultivation—of greatly diminishing the extent annually under bare fallow—of increasing, in a proportionate degree, the quantity employed in the growth of Turnips, and of augmenting the quantity and improving the quality of the Corn-crops, besides many other advantages, too obvious and too numerous to be noticed here.

Aware of the utility of draining, and fully convinced that it is, not only the basis of all subsequent improvements, but also the source of immediate and lasting remuneration, the first thing which engages the consideration of a tenant, on entering a farm on a new lease, is the condition of the land with respect to moisture. Draining, if necessary, is his first operation; even before the old tenant takes his departure from the farm, his successor, not unusually, has his men busily employed in draining—first, the fallow and Turnip-land, if wet, and next, such of the Grass-fields as he intends to bring earliest under tillage.

Draining is carried on during every season of the year, and at all stages of the rotation, but the spring and summer months are generally preferred. Drains are sometimes made while the land is in Grass, immediately before ploughing it up for Oats; it is, however, whilst a field is in fallow, or in the course of being prepared for a Turnip-crop, that draining is generally executed.

The points which first engage the attention of the farmer on commencing to drain a field, are the situation, direction, and dimensions of the main-drains, or conduits, as they are called, which receive and convey the water from the smaller drains. Their number, situation, and direction, depend, of course, upon the uniformity or irregularity of surface which the field presents. Besides the main-drain, into which the whole or greater portion of the smaller ones are led, every considerable hollow must have a leading or running-drain, so directed along the lowest parts as to insure a uniform and sufficient fall for the water into the principal conductor, or other convenient channel, for its egress. The dimensions are regulated by the extent of land from which the drain is expected to receive water, the comparative wetness of the field, and the materials to be employed in filling. They are always made from 3 to 5 inches deeper than the ordinary or parallel drains, that the water may have a regular and uninterrupted fall from the latter, thereby preventing the lodgment of mud, or the stagnation of water at the junction of the drains. The breadth at top depends on the depth, and the breadth at the bottom on the materials for filling or building. When built of stones, in the manner afterwards to be described, the breadth at top is usually from $1\frac{1}{2}$ to 2 feet, and at bottom 10 to 14 inches. The general way of forming main-drains or conduits is by building a little wall of flat stones at both sides of the drain at bottom, 10 to 12 inches in height, leaving an aperture or channel of about 8 inches wide. It is then covered with strong flagstones prepared for the purpose, care being taken that any interstices between the covers are well filled up with small stones, in order to prevent any earthy particles from getting into the drain. This done, the broken stones are placed on the covers to within 14 or 16 inches of the surface of the land, covered with a little straw, and the earth ploughed in from both sides. Where suitable stones cannot be easily procured, large drain tiles, made for the purpose, are substituted. Two of the common-sized tiles, placed side by side in the drain, are sometimes employed for the same object. When it is intended to make the main drain very capacious, and particularly well-formed, a mason is employed for the purpose; but in the great majority of cases the whole is done by some handy and trustworthy farm servant.

It is a very generally observed rule throughout the county, in laying off ridges, that their direction shall be longitudinal, or with the greatest acclivity of the field. The drains are invariably made in the furrows between the ridges, unless the descent happens to be very rapid, in which case it is customary to cut the drains with a little inclination, in order to lessen the force of the water; but it has been, and I believe is still, a fertile source of discussion amongst English agriculturists, whether surface-drains are more efficacious in removing superfluous moisture, when made up the steepest ascent of an inclined field, than when carried in an angular direction across the slope. If the practice of the best Lothian farmers should have any influence in deciding such a controversy, the advocates for the "fair up and down" drains have unquestionably the best side of the dispute, except where the descent is so great as to endanger the bursting of the drains on account of the increased velocity of the water; but such situations seldom require draining.

Where the land is not very wet, and the farmer's time or capital is limited, he frequently makes a drain only in every alternate furrow at first, with the intention, however, of returning again, if necessary, on the furrows then passed over, at a subsequent opportunity. But when complete and uniform dryness is the object, drains are made in every furrow indiscriminately throughout the field, without regard to wet or dry appearances of certain portions. Ridges on the strong clay soils are almost invariably 17 or 18 feet wide; hence the distance of the drains apart, where made in every furrow, is also 17 or 18 feet, and 34 to 36 feet where made only in every alternate furrow.

The proper dimensions are determined chiefly by the materials used in filling. The depth, when broken stones are employed, varies from 28 to 32 inches, according to the uniformity of the surface. When tiles are used, from 18 to 21 inches is deemed sufficiently deep. The breadth at top is commonly 14 inches, being made as narrow as barely to allow the labourer to work with freedom, and the sides of the drain regularly sloped down, making the breadth at bottom at about three inches when stones are used, or about 6 inches in the case of tiles.—*T. Sullivan.*

[The following typographical error occurs in one of Mr. Sullivan's previous articles:—At page 343 it is said that the poor-rates of the parish have latterly amounted to 90*l.* per annum, which, the rental being 7339*l.* 6*s.*, is a rate of 1*s.* 4*d.* for the tenant's share. It should have been said, as any one may easily ascertain by calculation, that this is a rate of $1\frac{1}{4}d.$ for the tenant's share.]

ON BLACK HORSEPONDS.—No. V.

In former papers on this subject we have seen that the urine of cattle contains many soluble salts, and also a portion of animal matter, capable of producing the most beneficial results on the crops when applied to the soil, but that in many instances, instead of being thus used, it is allowed to escape into the horsepond, in which it undergoes the putrefactive fermentation.

I have endeavoured to show the *profits* which might arise from applying these ingredients directly to the land. This is the first part of my subject. I now enter upon the second, and point out the *loss* which ensues from allowing the cattle to drink them.

When the animal body is supplied with fresh air, sound food, and pure water, and is not exposed to any extensive cause of injury to the system, a healthy action goes on until the natural decay from age commences; but when any substance is received into the constitution capable of producing disorganisation, disease and death are the consequence.

If a drop of alcohol or sulphuric acid is allowed to fall into the serum of blood, or into an aqueous solution of the white of egg, we quickly see a white curd precipitate thrown down—the proof that decomposition has taken place. Touch the skin with a stick of moistened nitrate of silver, (lunar caustic) and the spot will shortly assume a blueish or violet colour. Immerse a piece of flesh in sulphuric acid or solution of potash, and the flesh will become shrunken and dissolve like a crystal of salt: the tissue has become disorganised. The body of the animal which drinks at these black horseponds is exposed to similar causes of disorganisation, which, without acting so intensely, or with such immediate effect, bring at length, with no less certainty, premature decay; and though the action is slow and gradual, it is frequently the more dangerous and inevitable, as it is more invisible. The cause being unsuspected, no availing efforts are made to check the consummation of the work of death. It is true these causes produce only local diseases when they are confined to the surface, or, when attacking some organ placed at a greater depth, they intercept its communication with the general circulation; and in this case the organ itself may be greatly compromised, without the general life suffering any greater disturbance than the fever which arises from the disarrangement of the equilibrium in the organic functions. But if substances of a more active nature be introduced into the system, disease of an active character, followed by death, is the immediate consequence. Thus, if an inorganic poison, as arsenic, be introduced into the stomach of an animal, disorganisation of the coats of that organ will be the consequence—a portion of the poison passing into the circulation, and destroying life in a very short period; but if organic poisons are introduced into the system through the stomach, little or no appearance of disease is to be detected in that organ, yet death is the consequence, from its producing disorganisation of the vital fluid. The same effects are produced when the poisonous matter is introduced beneath the skin, or placed on a wound; thus, when putrid animal matter is placed on an abraded surface, the absorbent vessels carry the poisonous matter into the system, and vomiting and debility, often followed by delirium and death, is the consequence. This is well illustrated in the disease which often follows a punctured wound received during the dissection of a body in a state of putrefaction. The poisonous effects produced by eating imperfectly prepared sausages, and putrid meats, are of the same class. Liebig states that several hundred cases are known in which death has occurred from the use of this kind of food. These sausages, he says, are prepared from blood, liver, bacon, brains, milk, meal, and bread mixed with salt and spices; this mixture is stuffed into prepared intestines, and boiled or smoked, and, if properly prepared, may be preserved for months, furnishing a nutritious diet; but when the spices and salt are deficient, and particularly when they are not sufficiently smoked, they undergo a kind of putrefaction, which begins at the centre of the sausage. The death following poisoning with these sausages is very lingering, and marked with remarkable symptoms. There is a gradual wasting of the muscular fibre and of all the constituents of the body; the patient becomes much emaciated, dries to a complete mummy, and finally dies. The carcase is stiff, as if frozen, and is not subject to putrefaction. In the *Gazette Médicale de Paris*, of July 2, 1842, is reported an account of a *fête* given in Andelfingen, in the canton of Zurich, in the month of June, at which about 600 persons were present, who all partook more or less of the repast provided, which consisted of cold roast veal and ham. As they returned home, some were seized with vomiting; next day, a greater number complained of general uneasiness, sickness, and diarrhœa, and in about eight or ten days all those who were present were confined to bed; of these many died; others suffered severely from symptoms of fever, of a typhoid character, with diarrhœa in a severe form, accompanied by delirium and loss of the hair during recovery. At the *post mortem* examination of those who died, the mucous membrane of the intestines was found to be softened, and in some cases ulcerated.

Such are the symptoms and effects on the human constitution, when animal matters in a state of decomposition have been received into the system; and when we consider that our domestic animals in many respects have their bodies constituted as those of man, are subject to

many of the same diseases, are relieved by the same mode of treatment, are acted on in a similar way by mineral poisons, and derive their nourishment from food similarly constituted to that which also nourishes man, is it not more than probable that the same causes will produce the same effects in the one as in the other, and that they are both subject to the same organic laws? Such being granted (and I believe no physiologist doubts the fact) it will not be difficult to prove that the amount of decomposing animal and vegetable matter, besides salts of ammonia, potash, and soda, which are held in solution in the water of black horseponds, and which is the cause of their colour, must have a most injurious tendency when received into the constitution of the animal drinking of such water; not that there is sufficient to produce disease or death by once or twice drinking of it; but, when taken in small quantities, and repeated often, it tends as certainly to engender disease, of a more or less formidable character, as if it had been taken in a large quantity at once; and although the effects are not in every case sufficient to produce the death of the animal, and thereby possibly call the attention of the farmer to the cause, nevertheless, by impairing the functions of nearly all the organs of the body, the same injurious effects are produced. The stomach is unable to secrete a healthy gastric juice, hence digestion is imperfect. The secretion of the liver is of an unhealthy character, and this, when mixed with the half-digested food, irritates and inflames the mucous membrane of the intestines, producing a chronic disease of a formidable character—a disease which prevents the system from being supplied with that amount of healthy blood-forming principle, which alone will enable it to perform the various offices required of it.—*Alfred Gyde, Painswick.*

ON THE CULTIVATION OF FLAX.—No. VIII.

(*Concluded from page* 343.)

The importance of saving the seed of the Flax-crop has been incidentally mentioned in the course of these papers on its cultivation. The value of the seed must be apparent, when it is considered what large sums are annually paid to the Dutch, Russian, and American Flax-growers for this article alone, the greater part of which might undoubtedly be produced at home; but this item of the produce of the crop has hitherto been almost entirely neglected by the British and Irish farmers, from an erroneous impression that the saving of the seed is injurious to the quality of the fibre,—what would be gained on the one hand, being thus supposed to be lost on the other. That the saving of the seed is, however, compatible with the production of the finest quality of fibre, is abundantly proved by the Dutch and Belgian Flax-growers. It is from these countries that Flax-seed of the best quality is obtained, and it is well known that it is also from them that our manufacturers have procured the finest fibre for spinning.

The quality of the seed will depend on the management previously adopted in the treatment of the crop—whether it had been thinly or thickly sown, and also whether it had attained a considerable degree of ripeness before pulling. When properly saved it may with propriety be used for sowing, and will not be inferior, for this purpose, to any imported seed. The propriety of sowing seed saved at home, even in preference to that imported, would appear from the practice of the Dutch, whose management in every department of the culture of this crop is so well worthy of imitation. Change of seed would, to a certain extent, still be necessary to prevent deterioration, as in the case of any of our other cultivated crops, but then a change is not required every year. To guard against deterioration, the Dutch Flax-growers occasionally import a part of their supply from Riga, the produce of which, when sown in Holland, is found to grow coarse, and yield a bulky crop the first year, which is generally but little prized. The seed produced from this is always sown a second year, and the seed it then yields is that most prized for sowing again, as producing the best and finest Flax. The seed of the third crop, which is considered unfit for use, is exported, and this is what is so much prized by us. In order to have always ready for use seed of the best quality, many of the Dutch and Belgian Flax-growers sow a small quantity of Riga seed every year, to secure seed of the second year's growth for their general crop. It would, therefore, appear that our farmers might raise at home a considerable portion of the seed required for sowing, and that perhaps of superior quality, instead of using so much from foreign countries, some of which is the refuse of their markets. Even in Ireland some cases have occurred in which the finest samples of Flax brought to market were produced from home-saved seed; and for the first year at least, it is extremely probable that seed of home growth, itself the produce of imported seed, would be the most valuable which the farmer could employ.

But under the best course of management which can be devised, much of the seed saved will be unfit for sowing; nor is it necessary that it should be so, as the demand for this purpose is small when compared with the supply. Large quantities of foreign seed are annually imported for crushing, which could advantageously be produced at home. Flax-seed is also much prized as an article of food for the domestic animals of the farm,—a purpose to which it may always be profitably devoted. The value of oil-cake, which is the portion of the Flax-seed remaining after the oil has been expressed, is well known for its fattening properties; from which the value of even this refuse seed, before expression, may be inferred. The chaff or husk, forming the capsule in which the seeds are contained, is of itself found to be a nutritive article of food for cattle or swine; so that, in fact, under economical management, the cultivation of this crop, from the increased attention now devoted to the subject, is likely to be much more remunerating than it has hitherto been.

The seed, after being taken off the Flax in the manner described, is carried to the farm-yard, and thinly spread over the floor of the barn or granary, or in open sheds when the floors are not damp. The capsules must not be allowed to remain any length of time in the heaps in the field where the rippling is going on, to guard against heating and fermentation setting actively in, which at this stage proceeds with great rapidity. They must not be spread more than 3 or 4 inches deep on the floors; indeed, wherever space can be provided, the more thinly they are distributed over the floors the better, as this not only secures the seed being saved in a much shorter time, but also saves an immensity of labour in turning it. The intervals of time between the several turnings are regulated by the state of the capsules, and the manner in which they are distributed over the floor; but at first the whole must be turned over at least two or three times a day. Where the quantity of seed to be saved is large, it may probably be necessary to give the whole a slight kiln-drying, which, as already mentioned in a previous article, will not injure the seed either as food for the domestic animals or for the oil-manufacturer; but no artificial heat must be used to dry the seed intended for sowing.

After being thoroughly dried, it will be necessary to pass the capsules through a winnowing machine, to separate the sand, dust, and other matters from them which become mingled with them in the rippling process, and afterwards when spread out on the floors to dry. This refuse would otherwise be incorporated with the chaff after the separation of the seed, and render it worthless as an article of food. A case of the injurious effects resulting from the neglect of this process, and giving the refuse to horses and cattle without winnowing previous to bruising, came under my own observation, in which it proved fatal to the animals simply from its containing a quantity of sand and other matters, which were found in quantities in their stomachs and bowels after death.

The course of management here described is only necessary with Flax treated in the autumn. When the Courtrai system is practised, the seed is of course effectually dried on the stem before the crop is stored up; and, on its being thrashed off during the winter, it may be stored in any quantity without any danger of fermentation setting in. To secure seed of the finest quality this is obviously the most eligible mode of proceeding which can be adopted, and the experience of the Continental growers has also proved it to be that best calculated to insure fibre of the best description.

The separation of the seed from the chaff, after the capsules have been thoroughly dried, is easily effected. Where the Courtrai system of management has been adopted, this separation will partially take place in taking the capsules off the flax, which has been already described: the most valuable portion of the seed will at all events be thus disengaged, and when intended for sowing, the seed thus separated should be kept apart from the remainder, which will be of inferior quality. In other cases the work will be performed with facility by passing the capsules through a Corn-mill, the stones being placed as for shelling Oats, after which the separation is completed by the winnowing machine. When the seed, as well as the refuse, is intended for feeding, it will be unimportant whether they be separated by winnowing or not, as the whole may, with propriety, be boiled up together with Turnips, cut Hay and Straw, and other matters. This mixture is highly relished by horses, cattle, and swine, and is not inferior to any other food which can be given to them for bringing them into condition. Experience will soon enable the farmer to determine the quantity which should be given; but it may be here observed that, in the case of no part of the seed being separated from the chaff, the allowance even for the largest-sized animals should be very small—perhaps not more than from two to three quarts for each feed. In the measures for the extension of Flax cultivation at present in progress in this country, this department of the produce seems to be attracting much attention, though hitherto almost entirely neglected in Ireland, where its cultivation has been so long carried on.

Although Flax-seed is much relished by every species of animals on the farm, it is peculiarly adapted as food for calves, the jelly formed of it being, to a certain extent, one of the best substitutes for milk hitherto discovered. The pure seed only is employed in this case, which is boiled for several hours over a slow fire, the quantity of water to be added being such as will make the jelly of the consistence at which it can be taken by the young animals in combination with their milk. Sudden changes of food are well known to be extremely prejudicial to young calves, and in using Flax-seed jelly with milk, the quantity of that article should be small at first, and gradually increased as it is found to agree with them. It is almost superfluous to remark, that any excess of this or any other substitute for milk, is denoted by its action on the bowels of the animals; and when any degree of purging is produced, the quantity of such substitutes should be diminished, and the proportion of milk increased. It would, of course, be an exaggeration to contend for the superiority of jelly over milk; but when it is found necessary to economise the supply of milk, especially in the vicinity of large towns, where it commands a high price, it may be safely said that no better substitute than Flax-seed jelly has been hitherto employed, whether as regards economy, or its adaptation for the purpose. As the young animals advance in growth, other farinaceous matters may be added to th jelly, and the milk still further economised.

These, then, are the principal details connected with the culture and management of Flax, of which it is considered necessary that the intending cultivator should be in possession. They have been given with great minuteness of detail, but it is conceived that without this, practical instructions are of comparatively little value. They have not been intended to raise any false expectations as to the returns which are likely to be obtained, unless under the most skilful treatment; and as, however valuable written instructions may be for the guidance of the farmer, they are not of themselves sufficient, without some degree of practical knowledge being previously acquired, it will be well that those attempting the cultivation of this crop for the first time, should do so on a small scale, and the errors of which they may be guilty in this course of management, while they will not be productive of much loss, will afford more valuable information for the regulation of their future proceedings than any instructions, however accurate or minutely detailed.—*J. Sproule.*

Home Correspondence.

Top-Dressing for Wheat, Barley, and Oats.—For April, May, and beginning of June, for all soils deficient in plant, or in a weakly state, the following application will prevent the wire-worm destroying the roots (as all insects, rats and mice also, will not stay where genuine guano is near), and, in a great many instances, it has destroyed the wire-worm altogether, and prevented mildew. On gravel, sand, and light soils:—2 cwt. of guano, and 2 cwt. of gypsum, or 2 cwt. of guano, with three times the bulk of marl or strong clay. For clay and strong land:—2 cwt. of guano, with three times the bulk of charcoal, coal, turf, sod, or peat ashes. The above, if applied to crops of Corn, in a healthy state, will give additional increase to the same generally, quality finer, bulk of straw greater, and earlier at maturity, than farm-yard manure, or bones, with less labour, and half the expense. For Potatoes on ordinary soils:—3 cwt. of guano, with three times its bulk in ashes or earth, with 10 tons, or half the usual quantity of farm-yard manure, to be strewed at the bottom of the furrows, by hand, before the sets are planted; and the same will not only increase the crop one-third in quantity, but it will be earlier, quality superior, and the disease, so prevalent a few years back, will not return. It must be particularly observed, in drilling guano, or ploughing it in, after being sown broadcast, previous to having it turned over, the depth of the furrow should be calculated, according to the nature of the soil. If cold, nearer the surface than gravel, or light soils: and to those agriculturists that have not experienced the increase, by the introduction of guano, it is advisable, to show the marked alteration, to leave a quarter of an acre of each in its original state, and to notice the difference in produce and quality, also of that on farm-yard manure, and bones, if used in the same field, as an experiment. It is also evident, from the trials I have witnesssed, as well as from many others, the results of which have been published, that it should not be applied in immediate contact with the seed. If, therefore, it is applied by the drill, which I believe to be the best mode, it should be applied by a separate coulter, and by the mode adopted in the improved Suffolk drills, by which the manure is deposited in the soil so much deeper, and so much in advance of the seed, as to allow a portion of the soil to be interposed between the seed and the manure beneath it. Like all other concentrated fertilisers, it is decidedly certain that, for the most successful development of its powers, it requires a considerable supply of moisture, and will therefore produce the best results during wet seasons. It is used, it seems, in many situations in Peru, which are immediately afterwards irrigated. In case of crops to be produced from seed, great precaution should be observed that it does not come in direct contact with the guano, as few drop-drills are calculated for the purpose.—*H. A. Harwood, Liverpool.*

[With regard to what is said about guano destroying wire-worm, it is certainly possible that such an effect might follow the application; but we should greatly have preferred a specific account of one instance in which it had been thus successful, to so general a statement as our correspondent gives—"and, in a great many instances, has destroyed the wire-worm altogether, and prevented mildew." Our own opinion is, that it will not have this effect.]

Potatoes.—Might you not exhort the Agricultural Society, or some other body, to undertake some systematic experiment respecting the culture of Potatoes? There is the greatest confusion on the subject, and the most contradictory advice. Nothing but large and careful experiment will settle the many questions on this subject. I should be much inclined to test your friend "J. McI.'s" advice by planting in autumn; but dare I trust a midland counties' winter-frost? He writes from Ireland; and here a frost will sometimes penetrate nearly a foot deep.—*P.*

[It is certainly much to be wished that Societies or individuals would systematically direct their attention to this subject, and inquire by experiment into the truth of the matter.]

Turnip-Fly.—I have found that half an ounce of sulphur mixed with a pound of Turnip-seed, prevents the ravages of the fly. The experiment is easy, and has not been known in any case to fail. I have used this plan with success for several years, and have not lost a single Turnip. It has been tried on a small scale in my immediate neighbourhood, and in no case has it failed to protect the young Turnip from the fly.—*W. Driffield.*

Rot in Sheep.—I thank "N. D. D." for noticing what I said respecting the rot in sheep. By what he says at p. 323, little is known as to how the fluke gets into sheeps' liver, or, in other words, the cause of the disease. What "N. D. D." has related about the origin of the fluke and sandore is very interesting; but, may I be allowed to make a few remarks on one or two of his observations? He almost hints that the animal called the fluke, which is said to cause the rot in sheep, might arise from spontaneous generation, and "that it has never been found out of the sheep's liver or that of other animals." As regards the latter, there must be a mistake, for he quotes from Cuvier that the "fluke has been found in the eye of man." A friend of mine, who has had much experience in the disease in sheep, told me he has often found the fluke in sheep's gall. As to spontaneous generation, it is a term often applied when a thing cannot be traced to its proper origin. I mentioned a plant called the Rot-weed, which is blamed for causing the rot in sheep, and observed that they might eat the plant containing eggs, or larvæ of insects which produced the animal found in their liver; but it appears that is wrong, for "N. D. D." mentions that the fluke and sandore are not produced from insects—"they are perfect animals forming a genus of the second class of the radiated animals." May not wet food encourage the growth of the fluke, and, as "N. D. D." observes, render them "dropsical and finally kill them?" —*J. Wighton.*

Manures, and Steeping Seeds.—Some of your readers may be amused at the style, as well as at the matter of the following quotations from "The Curiosities of Nature and Art in Husbandry and Gardening," published in 1707. They show that the value of the inorganic parts of manure, and the advantage of steeping seeds, were well known at that time. "The whole secret of multiplication consists in the right use of salts. Salt, says Palissy, *is the principal substance and virtue of dung.* A field may be sown every year, if we restore to it by stercoration what we take from it in the harvest." . . . . "Seeing all multiplication depends on salts, the main business is to get together a great quantity at little expense, that the profit may be the greater." The author then describes a method of making liquid manure, in three old casks, into which objects are separately thrown, according to the ease with which they decompose. He further urges the importance of burning all wild plants, and of carefully dissolving the soluble parts of their ashes, and then proceeds—'Take as many pounds of saltpetre or nitre as you have acres of land to sow. For each acre dissolve a pound of saltpetre in twelve pints of the water that sanks from the dunghill. When the saltpetre is quite melted, throw in a little of those salts of plants (i. e. ashes) according to the quantity you have of them. This liquor is then called the 'Universal Matter,' because nitre is truly the universal spirit of the elementary world. This is the main point of the whole secret of multiplication. We will for the future call the water that is got ready in the casks, *Prepared Water*, and the water from which the salts are extracted from plants, and the nitre, *Universal Matter.* For one acre, take twelve pints of the prepared water, and mix with it immediately the universal matter, in which there ought to be a pound of dissolved nitre. The vessel into which you put these liquors must be large enough to contain the corn which you design for one acre. Then strew in your corn into these liquors; there must be two inches of water above the seed. Leave the corn to soak for twelve hours, and stir it up and down every two. If by that time it do not swell, let it lie longer till it begin to plump up considerably. One third less of seed than usual will serve for an acre; nay, you may safely use but half as much, and mingle among it some straw cut very small, that the sower may take it up by handfuls and sow it in the ordinary way, as I have said already." The explanation the author offers of the use of soaking seeds is whimsical. He says that the first action is to "cut the covers that infold the sprouts," and that the second action is "to serve each grain of corn, as it were, instead of a loadstone, to attract the nitre of the earth, which the subterranean fires have reduced and driven into steams and vapours in the low and middle region of the air, for the nourishment of vegetables and of animals. This is not a vain imagination, a chimera, or empty notion."—*C. Darwin.*

Agricultural Weeds.—It must be well known to every cultivator of the soil that these are of a more hardy and vigorous nature than the plants which require the care of his fostering hand, and are apt to gain the superiority, and appropriate to themselves vegetable aliment not intended for them. Hence it is of the greatest importance to every cultivator of the soil to prevent, as far as practicable, the growth of every kind of vegetable, except those which he cultivates. The number of plants known as weeds is very great; they are either annual, biennial, or perennial; the first two die the first or second year, *i. e.* as soon as their seeds are perfected, and are propagated by their seeds; the latter are not only multiplied by their seeds, but also by their roots, which remain inactive during winter, and put forth new plants in spring. The seeds of some plants germinate as soon as they get moisture, although they are not in immediate contact with the soil; others, again, do not succeed unless they adhere to some kind of earthy substance, and enjoy the reviving influence of the atmosphere. Many seeds, however—even those of the most diminutive size—will remain inactive for a long series of years, and vegetate afterwards, *i. e.* as soon as any accident has placed them in a favourable situation; seeds which have been proved to be not less than 1800 years old have germinated, and produced thriving plants. Again, many seeds are accommodated with some kind of wing or feather, by which they are conveyed from their place of birth, and disseminated over the fields; for instance, the seeds of the Dock tribe have little wings, somewhat resembling those of a bat, by which they are often conveyed to a considerable distance in high winds; others are furnished with still better means of travelling, and are able to take advantage of the slightest breeze for shifting their position. It is proper that all Grass-fields, hedge-rows, and waste ground, be kept perfectly free from unprofitable herbage. The negligence which occurs in this respect in many places, is often the cause of the foul state in which neighbouring lands are to be seen. Pastures are sometimes so closely overrun with weeds, that the cattle can scarcely pick up a mouthful of pure herbage, and the vegetable food applied, which should nourish wholesome pasture, is consumed by useless weeds.—*J. McI., Hillsborough.*

Turnips.—I am a dealer in Turnip seeds, and am frequently put to considerable inconvenience by the various names by which my customers are pleased to designate the sorts which they may require. It is this inconvenience, with the view of obviating the same, for the benefit of myself and others similarly situated, that has prompted me to trouble you with the annexed list of names, trusting that you or some one of your numerous correspondents will furnish, in an early Number of your valuable Paper, a descriptive list with definite names (other names being considered as synonymous) of the different varieties; which may be a means of preventing error, to a great extent, both to the seedsman and the sower.—*West Briton.* [With this communication came a list of the names of 48 varieties, which we do not now publish, in the hope that a mere notice of the important subject referred to, will succeed in eliciting from our farming correspondents descriptions of the appearance and merits, with the names of the different varieties they may grow.]

Fencing.—The following method of making, in a very cheap and expeditious manner, a fence to inclose ground, I have observed adopted in this neighbourhood:—First, take some sapling Oak poles, about five or six yards long, cut them into lengths of something more than a yard, and cleave the thickest part into four, and the middle into three, to produce stakes. Dig a trench two spade-grafts deep, and make a bank with the sods, of two spade-grafts high, breaking them as little as possible; cut the sods sloping, not perpendicular to the surface of the ground, and lay them sloping in the same direction for the bank, so that, from the top of the bank to the bottom of the ditch, shall be one sloping line; let the sods of the second spade-graft be placed on the top of those of the first, but let the joinings be like those of bricks in a wall, the joining between two sods above over the middle of the sod below, and let all the earth of the second spade-graft be thrown so as to back the fence. Drive the stakes, well pointed, through the sods of the upper layer, and considerably into those of the under layer, at about the distance of half a yard from each other. Then take the straggling Furze, stubbed for the purpose, and thrust the heads of them very forward into the face of the bank, contriving that the two main branches of the Furze shall be one on each side of the stake. Over all this wind the longest Blackthorns, and the fence will be sufficiently strong without binders.—*W. H., Reading.*

Small Farms.—Seeing by your answers to correspondents in your last, that some questions have been put to you on the best plan of cultivating a small plot of land, so as to keep the greatest quantity of stock, I hope it will not be thought out of place if I detail to you the plan I follow on a field of 4½ acres. The land is good, being a free light soil, on a chalky bottom. Of course I have not neglected Lucerne, but have devoted one half acre to this, sowing it in drills 9 inches apart, and hoed each time of mowing, which I am able to do five times in the season. The remaining 4 acres I divide into four equal parts, and cultivate as follows:—To make my plan clear, however, I must begin my rotation where most rotations end, viz., with Wheat. Say, then, that I have my field well prepared for Wheat; this grain is accordingly sown in drills, with very little seed, and in the following spring has Clover and Rye-grass harrowed in with it; next year these are mown three times, and after the last mowing I give a good top-dressing of well-rotted dung, which produces, next spring, a very early and plentiful crop, chiefly Rye-grass; this is either mown for stock, or for Hay; and on the half first cleared I plant Potatoes, without dung, on the other I sow Swedish Turnips, which have a dressing of guano; the Potatoes are planted from the 1st to the 20th of May, and the Swedes are in the ground in the same month. The following year the Potatoes are succeeded by Mangold Wurzel, dressed with guano, and the Swedes by Carrots, with dung. This forms my preparation for Wheat, as before alluded to, and I do not know that I could raise a greater quantity of more valuable produce for the feeding of stock by any other plan; it is also as little expensive as possible, three diggings only in four years being required. If I introduce Tares, as you recommend, on one half of the Wheat-stubble, another digging is required, and though I am not insensible to their superiority over Clover and Rye-grass as an improving crop, I think it is much overbalanced by the extra digging and the price of the seed. I have also a strong partiality for Rye-grass as food for stock—nothing is so much liked by horses, and on no green crop whatever will they do so much work: I mean this, however, to apply to it in its early growth; when it gets old, and ripens its seed, the ground might as well bear a crop of Corn, and stock would relish straw quite as much. As it seems a general opinion that Potatoes do best when left in the ground all winter, I propose to try the effect of covering them up with stable litter, raking off the long straw when taken up, and digging in the short dung. In such case, a dressing of guano would be saved for the Mangold Wurzel which follows.—*Senex.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

[Report of Proceedings of the Weekly Councils of May 15 and 29, concluded.]

THE Right Hon. Earl Spencer, President, in the chair.

PRIZE ESSAYS.—Mr. Pusey, M.P., Chairman of the Journal Committee, reported to the Council the unanimous decision of the Judges, in assigning the Society's Prize of 50*l.* for the best Essay on the Agriculture of Cheshire to Mr. Wm. Palin, of Stapleford Hall, near Chester; and the liberality of Mr. John Arkell, of Hollow Farm, near Gloucester, who, in announcing himself as the author of one of the highly-commended Essays on the Discrimination of Soils, had presented his Essay to the Society for whatever use the Journal Committee might think proper to make of it, in promoting the objects of the Society.

SHREWSBURY MEETING.—The stipulations entered into by the authorities of Shrewsbury with the Secretary of the Society, in reference to the condition of the resolution at the last Monthly Council, deciding on Shrewsbury as the place of the annual country meeting of 1845, were laid before the Council, and having been read were unanimously adopted.

DYNAMOMETER.—Mr. Clyburn, director of the Earl of Ducie's iron-works, in Gloucestershire, addressed to the Council a letter on the subject of the trial of Dynamometers recommended by the Council, on the report of the Judges of Implements, at the Derby meeting, in the autumn of last year, to be entrusted to the Duke of Richmond, the Hon. Capt. Spencer, and Mr. Jaques, with a request that after the successive trials they had each made of the Dynamometers sent to them, they would report to the Council their respective merits when applied to the draught of agricultural implements; the instruments being submitted in the first instance to Mr. Parkes, the consulting engineer of the Society, for the purpose of having their mechanical adjustments, and graduation of scale under the strain of given successive weights, duly ascertained previously to the trial. Mr. Clyburn stated that one of his self-recording Dynamometers having been completed for the trial, was now forwarded to the Society, with printed instructions for its use. The Dynamometer sent by Mr. Clyburn, would record a strain of draught up to 12 cwt. Its principle of action being self-recording, was different from that of other Dynamometers, the box containing the instrument being supported on wheels, which communicated, by their axil, a progressive revolution to the recording cylinder within it as the draught proceeded, and its registration was made continuously by the pencil moving over its ruled surface: the average amount of draught being obtained by inspection of the indications thus obtained of the mometary variations during any given time and space. The Dynamometer of Messrs. Cottam and Hallen had also been duly forwarded for the trial. This instrument in its original form is described and figured in Mr. Handley's paper on Wheel and Swing Ploughs, (Journal, i. 143), and its improvements detailed by Mr. Pusey in his paper on the Draught of Ploughs (Journal, i. 219). Mr. Slaney having informed the Council that he had tried a very simple and cheap Dynamometer, made by Messrs. Drummond, of Stirling, with very satisfactory results, the Council agreed to recommend the purchase of this instrument, at the next monthly meeting, for the purpose of adding it to the others for trial. The Council resolved, that, as much time and care would be required for the proposed investigation into the practical merits of these instruments, and the estimate of their relative value accordingly, the trial should be postponed until the autumn of the present year.

DESTRUCTION OF RATS.—Captain Forbes, R. N., having called the attention of the Council to the damage and loss sustained by farmers, in consequence of the ravages effected by the common rat and other injurious animals, Mr. Meyer addressed a letter to the Council on this subject. He stated, that having for the last twelve years devoted his attention to the study of the natural history of the rat, as found in different countries of Europe, he had arrived at a complete knowledge of the sagacity, nature, and peculiar habits of that destructive animal, and of the preparations applicable, under all the circumstances, which would lead to its entire extirpation. He proposed to the Council, that various farms infested with rats should be selected for the trial of these preparations, in order that he might have an opportunity of proving their practical value, and of entering afterwards into any general arrangement with the Society or its members. He had already extensive contracts with the principal West India merchants for cleansing their estates and plantations. He referred to the certificates then submitted to the Council, in evidence of the successful result of his proceedings at Buckingham Palace and Gardens, Windsor Castle, and Frogmore Lodge, at the Mansion House, Newgate, Macclesfield Workhouse, and at various other public and private establishments in this country; and to those given to him by the officers of the Royal Households of the Emperor of Russia, and the Kings of Prussia and Denmark.—Colonel Challoner stated that, having received from the Hon. Mr. Murray and other parties connected with Her Majesty's Household, the most undeni-

able evidence of the complete success of Mr. Meyer's operations, he had been induced to engage him for the purpose of obtaining through his means the same exemption at his own establishment at Portnall Park; to which an unusual influx of rats had been occasioned by Mr. Meyer's successful dispersion of them from his neighbours in that part of Surrey.—At the succeeding Council, Colonel Challoner, being called upon by the President to favour the members with a report on the result of Mr. Meyer's operations at Portnall Park, he stated to the meeting, that the applications had been perfectly successful in his own case, as in that of others; that the rats never died in the house, the peculiar effect of the preparation causing them to seek the open air, without attempting to return to their former haunts; its odour driving them away, while its substance, if eaten, caused certain death. Colonel Challoner suggested, that as there was a very general complaint among farmers at the present time, of the waste and consumption of produce effected by these destructive animals, it would be satisfactory to many members, whose premises were infested, to hear from Mr. Meyer himself a statement on the subject.—The Council then granted leave accordingly, for Mr. Meyer to attend the ensuing weekly meeting on the 29th of May.—Mr. Meyer, in his personal statement on that day to the Council, explained the general effects of his preparations, and the uniform success which had attended their use. He had several of these preparations, which were applicable in rotation according to circumstances, but not one of them contained a single grain of arsenic or other poison, strong enough to produce death in larger animals, in the quantities in which it was employed. The expense of the ingredients was very trifling; and the ease with which estates or premises, of any extent, could be rendered free from rats, constituted the difference between his own mode of extirpation and that of other parties who professed to accomplish that object. There was, in fact, he believed, no place entirely free from these animals, for any long time together, and the process he employed was so simple that any farmer could follow it out as efficiently as he could himself, on being made acquainted with its principle. His chief secret consisted in the chemical nature of his compounds, and a knowledge of their proper application, employed by his father (a practical chemist in Germany) for 30 years, and by himself for 12 years; the peculiar action of the poison affecting the respiration of the animal and driving him from the house to seek the fresh air, such access of fresh air into the lungs only accelerating the fatal result. In a few days, any premises whatever could be thoroughly cleared of rats, and would remain so for a period varying from nine to fourteen months, according to circumstances. No poultry would be injured by the preparations used, and cats or dogs would be affected by only a temporary sickness. The remedy not only drove away the rats, but by its odour continued to have that effect for several months afterwards. It had the same influence over water-rats as the common rats on land.—On the motion of Lord Portman, seconded by the Marquis of Downshire, the Council returned to Mr. Meyer their thanks for the communication with which he had then favoured them.

Analysis of Limestones and Marls. — Sir Humphry Davy, in his "Agricultural Chemistry," describes a simple and exact mode, by which a person unacquainted with the minute details of analysis may ascertain, by inspection, the volume of carbonic acid gas given out by a limestone or marl, on the solution of a given portion of it in muriatic acid, and thus deduce, with a practical exactness sufficient for all ordinary purposes, the quantity, to the one-tenth of a grain, of carbonate of lime which may be present in any particular soil. Dr. Ure having devoted much of his attention for many years to a general simplification of the apparatus required by practical persons, in the processes of particular pursuits connected more or less with chemical science, attended the Council of the 29th of May, and favoured the members with the inspection of an apparatus similar in its object to that of Sir Humphry Davy, but slightly modified in its construction. In order to prove its accuracy, Dr. Ure performed before the Council an experiment with 100 grains of pounded marble, explaining, at each step of the process, the *rationale* of his proceeding. The equivalent amount of carbonic acid was almost immediately shown by the instrument. In reply to an inquiry by the President, Dr. Ure stated that the apparatus was capable of showing the presence and amount of the carbonate of magnesia contained in the magnesian limestones, but that a special scale would be required, and also a subsequent testing of the acid solution.—Dr. Ure then presented to the Council six samples of real, or normal guano, all of which had been the subjects of his careful analysis. Guano being a substance undergoing a slow but certain chemical change, the various cargoes brought to this country were as various as the conditions of time and climate could make them, and had never been imported in the original or normal condition in which the substances were voided by the sea-fowls furnishing the supply, richly charged with uric acid, the grand permanent pabulum of manure, which would give fertility for years, but in a state of putrefaction more or less advanced. Analyses spoke of ammonia and other results of that decomposition, but such compounds did not exist in the guano in its original state, as voided; while in other examinations of samples, it was found that all the uric acid and rich animal matter had become changed by heat and moisture, and all the azotised principle gone off in gas, nothing remaining but a carbonaceous residuum, of no comparative value. He had already presented to the Journal Committee a Paper showing—1st. These changes of uric acid; 2d. An account of guano in its fresh, decayed, or spurious state; 3d. A detailed view of the new methods of chemical research, which, after a period of twenty years' research, he had now brought to a practical result. The specimens of guano he presented were the Bolivian, Chilian, Peruvian, and African. He obtained the Bolivian from Bolivia about a year and a half ago: and because it gave no indications of the presence of ammonia, the cargoes were treated with perfect indifference by the merchants who had been accustomed to the article in its decaying state; but he found, that although dry as Irish snuff, that invaluable guano was rich in uric acid and animal matter, and capable of producing 22 per cent. of ammonia on its decomposition as a manure. It was so highly valued by the natives, that they were so much averse to its leaving the country, that genuine cargoes were now difficult to obtain.—On the motion of the Duke of Richmond, seconded by Mr. Pusey, M.P., the best thanks of the Council were voted to Dr. Ure for the presents he had then submitted to the Society, and for his kindness in making an experiment before the Council.

Draining Tiles and Tools.—Mr. Slaney reported to the Council the result of an inspection which had been made by the Marquess of Downshire, the Hon. Mr. Clive, and himself, of Mr. Clayton's new machine for making pipe-tiles, at 21, Upper Park-place, Dorset-square. They were much struck with the simplicity, cheapness, and effective operation of the machine in question; and particularly remarked the recent improvement in it, by which the clay, in its transit through the cylinder to the die at the bottom, was made to pass through a kind of sieve or strainer. This served to arrest any small stones or hard substances, which would otherwise have impeded the production of perfect pipes. A force of 25 lbs. on the winch sufficed to communicate, through the pinions and wheels, the requisite pressure to the piston; and so easy was the labour of working the machine rendered by this multiplication of power, that a woman might be employed for the purpose. Mr. Clive thought that many clays might perhaps be worked through this machine without pugging.

Mr. Pusey was of opinion that pipe-tiles were likely to come into general use, yet the members of the Society should exercise some caution in their proceedings. He had ordered one of Mr. Clayton's machines, but first thought it wise to send up some of his clay for trial, as he had two sorts. Neither of these clays were found to be suitable for pipes. On the other hand, the Speaker of the House of Commons had one of the same machines in use, which produced excellent pipes from his clay of the plastic kind. He particularly desired to call Mr. Parkes's attention to those points in the treatment of clays which bore on their necessary preparation for pipe machines, as also on the cost of burning pipes with coal. Mr. Pusey mentioned that he had heard from a Worcestershire farmer that pipes for drains had been successfully used for a longer period than had hitherto been imagined; but he had also heard of a case in which drains, formed of pipes and laid in a very soft soil, had failed for want of a method of joining them; and he thought that in soft and irregular subsoils a means of junction was desirable. He had early suggested the employment of a short piece of pipe of a larger size, into which the ends of two smaller pipes might be inserted. Another method had been adopted by tapering one end of a pipe 2 feet long, so that it entered the larger end of another pipe, and so satisfied was a farmer, neighbour to the party whose drains had failed, of the sufficiency of this method, that he had ordered 100,000 of such pipes.

Colonel Challoner desired to know from Mr. Parkes to what extent he considered the density of pipes ought to be carried, as he and others gathered from his previous remarks that Mr. Parkes attributed a considerable part of their action to their porosity and power of suction or absorption of water from soil.

Mr. Parkes stated, that some misapprehension of his meaning on a former occasion, seemed to have arisen as to the amount of the action performed by a pipe in absorbing water from soil. The experiment alluded to, related to the absorbing power of a pipe when immersed in water, and was cited as furnishing proof of porosity; but, under the circumstances in which pipes existed in drains, *i. e.*, embedded in earth, he conceived that, however wet the soil might be, a pipe would not be in a condition to absorb water so freely as in the experiment mentioned. It was easy to show, indeed it must be self-evident, that by far the greatest proportion of the water of drainage entered the conduit through the crevices between each pair of pipes. Nevertheless, he considered a certain degree of porosity to be a valuable property in a pipe, as the continued absorption of moisture must necessarily tend to harden the floor of a drain, and dry the soil in immediate contact with the pipes, after the flow ceased; to this effect alone he intended his previous remarks to apply. It would be impossible to assign, theoretically, what might be the best practical degrees of density and porosity to be given to such an article as a drain-tile. It is probable that its durability, which was very important, would depend on the quality of the clay and its density combined. The old Roman bricks made in this country were well known to have possessed wonderful durability, and they were very dense compared with the more porous and perishable modern English bricks. Yet, even the Roman bricks absorbed water, and he thought it would be very difficult, even were it desirable, to compress clay into the shape of a small cylindric pipe so as to render it unabsorbent. In Mr. Clayton's machine, a pressure of about 60 lbs. per square inch acted on the surface of the clay in the cylinder, in order to express the pipes with sufficient celerity; and he had shown in a former report to the Society, that the Kentish pipes were denser than other machine-made tiles; also, that those of the smallest bore and thinnest substance were denser than the larger and thicker pipes. He imagined that Mr. Clayton's machine would produce them yet denser than these, as he employed greater pressure and made them thinner than the old machine; but the density of a pipe would greatly depend on the texture and fineness of the clay employed in its manufacture.

With respect to the importance of some kind of union between every pair of pipes, Mr. Parkes agreed with Mr. Pusey that such an arrangement was desirable for very soft bottoms, and absolutely necessary, in order to adapt pipes as conduits in spouting sands, &c.; but he preferred, for such cases, the inserting an inch-bore or other sized pipe, according to the discharge required, a few inches into a full-length pipe of a larger size, easily fitting, rather than the using short pieces to form a joint. By the former plan, a great length of pipes could be put together on the surface, and then be let down into the prepared trench, where they would repose on the whole length and have the full bearing of the larger pipes, instead of resting on short pieces. Such a chain of pipes could never sink in places—the whole length must sink together, and equally, or not at all. Excepting, however, in very difficult cases, he did not think a joint necessary, if the trench were correctly formed as before explained. Simple means may be often used to render a soft bottom firm. He instanced Mr. John Taylor, of Mereworth, Kent, who, in draining some of his land with pipes from 3 to 4 feet deep, met with bottoms of soft boggy matter; sods were forced down into these soft places, and a firm bottom was secured, on which to place the pipes. No failure or disturbance had occurred in this work, and the drains ran throughout the year, as they receive the water of springs as well as rain. Clay, rammed down to the bottom of trenches in soft soils, would often answer, and make the work permanent.

In reply to a question from the President, Mr. Parkes said that he had referred, on a former occasion, to the elongation of a pipe, when wet, compared with the same when dry. He had found by nice measurement, that a small extension in length occurred when a perfectly dry pipe was moistened; he deemed it, therefore, of some consequence to keep pipes quite dry until they were placed in the drain, as the subsequent longitudinal expansion in a line of pipes would act as a force to keep their ends firmly pressed against each other, provided they were originally well and closely laid; and this force would contribute to prevent a pipe from sinking, if a small fault should occur in the floor of a drain underneath a pipe. He had found that it required a considerable force to dislocate or separate one pipe from another, when the ends only thus butted one against another.

In compliance with Mr. Pusey's desire, he had collected a good deal of information as regarded the preparation of clay, and the cost of burning pipes with coal. On the latter subject he had found, from personal inquiry of two highly respectable pipe tile-makers in Suffolk, that from 3 to $3\frac{1}{2}$ cwts. of coal were required to burn 1000 pipes 12 to 14 inches long, weighing from 2500 to 3000 lbs. per 1000; and Mr. Thomas Law Hodges, of Hempsted Park, Cranbrook, Kent, had recently informed him that his experienced potter, Mr. Hatcher, states, "The nearest calculation I can give, from experience, is, that 1 ton of good coals will be sufficient to burn 18,000 pipe-tiles of 1 inch bore or diameter; and 500 common brushwood faggots will produce the same effect." This was equal to about 1 1-9th cwt. of coal per 1000, and per 1000 lbs. weight, as the inch-pipes weighed about 1 lb. each.

As regarded the preparatory operations for rendering clays fit for being made into thin pipes, their nature varied with that of the clay. He believed there were few, if any, beds of clay to be met with which were fit for use without passing through the pug-mill; though he knew of pipe-tileries where washing was not found necessary. The washing of clay was an excellent and cheap process, and was capable of reducing hard as well as stony clays into a state fit for the pipe-machine. It was to be seen at most of the brick and tile-yards about London. The cost of getting the clay and washing here was about 2*s.* per 1000 bricks, weighing nearly 5000 lbs.; or about 5*d.* per 1000 lbs. of burned goods. This included the pumping up of water, which was rarely necessary in country tileries. He had found in Suffolk that getting and washing cost about 6*d.* per 1000 tiles, weighing 2500 lbs.; and Mr. Etheredge had informed him of a case in which it cost him 7*d.* for about 3000 lbs. The cost of washing was, therefore, quite insignificant when reckoned on pipes weighing only 1000 lbs. per thousand, and that of the apparatus would not exceed from 10*l.* to 15*l.*

Mr. Slaney remarked, as regards the porosity of pipes, and their absorption of water, he was disposed to attribute a greater action to them than did Mr. Parkes, the ingenious author of that idea. At the same time he would mention that another description of unglazed earthen pipe had been brought before the notice of the Commission on the Health of Towns, made in Scotland, which had been proved, he believed, to be capable of sustaining a vertical column of water 600 feet high without passing water through them. If he recollected rightly, the experiment had been conducted by Mr. Smith, of Deanston, with a view of showing the fitness of such pipes to convey water into towns.

Mr. Sainsbury, of Devizes, thinking that it did not

appear to be generally known that the pipe draining-tiles were made in Wiltshire, presented four such tiles, of different sizes, to the Society. These tiles varied in internal diameter from 1 to 2½ in., and in price from 21*s.* to 35*s.* per 1000.

The Rev. Thomas Cator presented a tile for the end of drains, having a transverse section made almost through it, near one of its extremities, for the purpose of receiving an iron grating, more or less raised as may be desired, to prevent the entrance of rats or rabbits into drains.

Mr. William Moffat, of Montpelier Street, Knightsbridge, had leave to exhibit his wood pattern for a drain-tile, intended to possess great power of absorption and a channel for the descending water, as well as a great saving in the material of stone for filling in the drains.

Mr. Hutchinson, of Rylcoll, Rutlandshire, presented three of the principal tools used by him in the process of shallow and deep draining, and manufactured by Messrs. Audley and Son, of Norbrigge, near Chesterfield. Mr. Hutchinson had for a considerable time experienced the advantage of implements such as those he then submitted to the Council both for strength and durability.

MILK SYPHONS AND PANS.—Lord Camoys presented to the Society, as requested by the Council, a specimen of the block-tin syphon he had applied so advantageously to the use of his dairy. This syphon is formed of a tube 18½ inches long, and ¼ inch internal diameter; it is bent in the form of a bow, and by means of a pivot (formed of a portion of similar tubing) 2 inches long, soldered as the portion of a radius inside the arc at its middle, it may be placed conveniently in the socket of an upright cylindric stand, and thus turned round in any direction. That portion of the tubular arch of the syphon intended to be inserted into the milk-pan, is only 9 inches long from the insertion in the socket of the stand, and its curve is circular; the other leg is 9½ inches long, and forms only a slight elliptic curve from the same point of the stand, so that its orifice is 1½ inch lower than that inserted in the pan. On this part of the tube is inserted, at 2½ inches from the top of the bend, a small stop-cock of block tin, with a small tapering mouth-piece of the same metal. The end of the syphon intended to be immersed in the milk has four very slight notches filed in it for the purpose of allowing the milk to pass through them sideways into the tube, when the end of it is pressed close to the flat surface of the bottom of the pan; but to prove too minute as a passage for the cream when the milk has all been drawn off. Lord Camoys stated that he had half-a-dozen such syphons in use for his own dairy at Stonor Park, and he found them most convenient for drawing off the milk, and draining every portion of it from the cream. They were almost self-acting. The dairy-maid had only to insert the tube, draw out the air with her mouth through the stop-cock, and the current being thus established, the syphons required no further attendance for a quarter of an hour, when the dairy-maid on her return found all the separation of the milk and cream not only effected with the least possible trouble to herself, but with an exactness not to be attained even with great care by the ordinary process of skimming. —The President suggested glass as a better material for the syphon than block-tin, on account of its transparency, and the consequent facility afforded for ascertaining by simple inspection the perfect freedom of the tube from any impurity on its inner surface.—Lord Camoys had found no acidity form, or impurity collect, in the block-tin tubes, which being pliable, might advantageously be bent and moulded into any convenient shape required. These syphons were made by His Lordship's tinman, at Henley-on-Thames, at 5*s.* 6*d.* each, and the wooden stands cost 2*s.* each. Any tinman could make them, and he should be much gratified to find, that a contrivance of which he only claimed the application, had been useful to the members of the Society.—Sir John W. Lubbock, Bart., informed the Council that he had tried Lord Camoys's plan of skimming by a syphon, and had found it to answer perfectly: he regarded it as a most valuable suggestion. He thought the Society were also much indebted to Mr. Pellatt for the readiness with which he undertook to manufacture the glass milk-pans, of similar shape to those with which Captain Carr had favoured the Society, but of superior glass, and at the lowest possible rate at which, under the present restrictions, articles of such a material could be produced. —Sir John Lubbock thought that these milk-pans would eventually supersede all others; and he suggested whether it would not be well for the Society to ascertain whether or not it is dangerous to use lead vats for the milk, or even glazed earthenware, as is stated in some works on the Dairy; as well as the metallic churn lately introduced. He considered that it would be an improvement in the shape of Mr. Pellatt's pan, if without much increase of expense, there was a cup at one end (like that in a venison-dish) to take the *last* milk for the syphon to dip into. He thought it probable that Mr. Pellatt, if it were suggested to him, would also manufacture glass tubes for syphons, to sell with the pans.

TUSSAC GRASS.—Mr. Pusey, M.P., laid before the Council the copy of a Despatch with which he had been favoured by Lord Stanley, addressed to his Lordship by General Moody, Governor of the Falkland Islands, on the subject of the Tussac Grass of that colony, which had attracted the attention of the Society. This document, after detailing various facts connected with the cultivation of this Grass, and the localities in the United Kingdom where it would probably become acclimatised, announced the collection of a certain quantity of the seed in the Islands, and its transmission to England. His Lordship stated, through Mr. Pusey, that this supply of seed was offered (at the price set upon it by the party who had been at the expense of its collection) to the Society, or to such party as they might nominate.—The Council ordered their best thanks to be returned for this communication; and allowed Messrs. Thomas Gibbs and Co., the Seedsmen to the Society, the option of becoming the purchasers of the supply of Tussac Seed, thus placed at the disposal of the Society.

Notices to Correspondents.

RURAL CHEMISTRY. By Edward Solly, Esq., F.R.S., Experimental Chemist to the Horticultural Society of London, Hon. Mem. of the Royal Agricultural Society, and Lecturer on Chemistry at the Royal Institution, has been reprinted from the *Gardeners' Chronicle*, with additions, and may be had of all booksellers, price 4*s.* 6*d.*

BUTTER.—*Anonymous.*—It is possible that the taste your butter acquires at this season is owing to the appearance of certain weeds in your pastures at this time. We do not know if buttercups affect the taste of butter.

COW CABBAGE.—*X. Z.*—There is nothing we know of in this plant to hinder farm-yard manure, guano, &c., from having the same fertilising influence on it which they exert on all other agricultural plants. Dig in 20 or 30 yards of the former, or hoe in 2 or 3 cwt. of the latter per acre, between the rows.

GUANO.—*A Subscriber.*—Unless your wheat is very late, we should judge it to be too late for sowing guano.

HUMIC ACID.—*A.*—Most vegetable soils contain it. Water containing it will redden vegetable blues.

MANURES.—*W. B.*—That which you point out is surely an error. We have applied to Mr. Karkeek about it.

NEW CAUSE OF FAILURE IN THE WHEAT CROPS.—As Mr. Curtis is investigating this subject, he would feel obliged to any correspondent for specimens of the Wheat-stalks, and the grubs infesting them, which have destroyed the Wheat around North Berwick. 11, Robert-st., Hampstead-road.

PEATY SOIL.—*Tyro.*—Your plan will, in all probability, succeed according to your wishes. The last application you speak of might, we think, be dispensed with; the leaves and charcoal would on so vegetable a soil make the land too rich. The lime will be beneficial. When you require to manure it, use 3 cwt. of guano per acre.

PROFITS OF FARMING.—*Plantagenet.*—It is impossible to answer your question; the answer depends upon so many circumstances, among which one of the most important is the amount of capital employed per acre.

SULPHURIC ACID AND BONES.—*W. M. D.*—The action of sulphuric acid on the phosphate of lime in bones does not liberate the whole of the phosphoric acid; the decomposition is only partial, so that the results of it are gypsum and superphosphate of lime, which is soluble in water. We published a short communication from you a few weeks ago.

SULPHURIC ACID.—*T. S.*—1 lb. of acid, according to Mr. Bree's experiments, will fix the ammonia of 2 gallons of urine; that is, equal to 1 gallon of the acid to about 36 of urine.

TIDAL MUD.—*Maritimus.*—Tidal mud varies in quality; the practice of warping land shows the opinion held of it on some shores. If you wish to apply it, probably the best mode would be to get it out and dry it in the summer; spread it as well as possible on the land in autumn; the frost, and your harrows in spring, will enable you to complete the spreading of it.

*** As usual, many communications have been received too late.

Markets.

MARK-LANE, MONDAY, June 3.

THE supply of English Wheat by land-carriage samples this morning was moderate, and the quality generally much inferior to what it has been; the trade opened heavily, and where sales were made a reduction of fully 1*s.* per qr. was submitted to, its value being affected by the liberation of Foreign, which is selling proportionably cheaper, and meets a fair demand at late prices. There was some inquiry for Baltic cargoes f. o. b., and also for Barley and Beans.—English Barley is unaltered, but Foreign commands an advance of 1*s.* per qr.—Beans are 1*s.* dearer; Peas remain the same as last week.—The quantity of Oats showing is small, and the sale brisk, at an improvement of from 6*d.* to 1*s.* per qr.

FRIDAY, June 7.

Since Monday, the arrivals of all descriptions of Corn have been moderate; the value of English Wheat remains as on that day. In Foreign, business has been rather inactive, but the quantity offering being moderate, where sales are effected its late value is fully supported. At low figures there is some demand f. o. b., but buyers are unwilling to comply with the late Baltic quotations.—Spring Corn of all kinds remains as last quoted, but the slight rain has somewhat damped the inquiry for Barley and Oats.

KINGSFORD AND LAY.

HOPS, FRIDAY, June 7.

THE Hop Market is firm, and the fly and lice are increasing in Worcester, Sussex, and the Weald of Kent, to such an extent that these districts are now considered to be in great danger of a severe blight. Midd. Kent, at present, is but slightly attacked with fly, but, with damp weather, a little fly has been known to blight this district.

PATTENDEN & SMITH, Hop-Factors.

COVENT-GARDEN, JUNE 8.—Grapes continue to increase in quantity as well as to improve in quality; remarkably fine specimens of Black Hamburghs are in the market, the best of which may be had for about 8*s.* per lb. Pine Apples are reduced in price since our last report; although not so good as they have been lately; there are, nevertheless, a few handsome fruit among them. Melons are good, and they are a little reduced in price; the best are selling at about 10*s.* each. Peaches and Nectarines are also lower in price; they improve rapidly. Cherries are very much cheaper this week. Among Strawberries we noticed some of Myatt's British Queen as being fine specimens of that variety; there are likewise good samples of Keen's Seedling to be met with in the market. Apples and Pears are becoming very scarce, and Oranges are not so plentiful as they have been. Of Vegetables Cauliflowers are somewhat reduced in price; they begin to improve in quality, as do also Carrots and Turnips. Some very large Rhubarb is in the market. The best French Beans are selling at 2*s* 6*d.* per 100. Asparagus is good and plentiful; and there is an abundance of good Peas in the market, which are selling at low prices. Gooseberries and Currants are liberally supplied; particularly the former, which are cheap. Lettuces and Salading of all kinds are sufficient for the demand. Among cut flowers we noticed Erica ventricosa superba, E. hybrida, E. Vestita alba, Gardenia radicans and florida, Pinks, Lily of the Valley, Pelargoniums, Fuchsias, Verbenas, Moss and other Roses, in great profusion.

FRUITS.

Pine Apple, per lb., 6*s* to 10*s*	Oranges, per dozen, 1*s* to 2*s* 6*d*
Grapes, Spanish, per lb, 1*s* to 1*s* 6*d*	— per 100, 6*s* to 16*s*
Hothouse Grapes, per lb., 4*s* to 8*s*	Lemons, per dozen, 1*s* to 2*s*
Melons, each, 5*s* to 10*s*	— per 100, 6*s* to 16*s*

Sorrel, per hf.-sieve, 6*d* to 9*d*	Garlic, per lb, 6*d* to 8*d*
Asparagus, per 100, 1*s* to 6*s*	Onions, per bunch, 2*d* to 10*d*
Artichokes, per doz, 5*s* to 8*s*	— large, per bushel, 1*s* to 3*s*
French Beans, per 100, 1*s* 6*d* to 2*s* 6*d*	— Spanish, per doz, 1*s* 6*d* to 3*s*
Autumn Potatoes, per lb., 3*d* to 6*d*	Shallots, per lb., 8*d* to 10*d*
Greens, per dozen, 1*s* 6*d* to 2*s* 6*d*	— Green, per bunch, 3*d* to 4*d*
Potatoes, per ton, 50*s* to 120*s*	Lettuce, per score, 6*d* to 1*s*
— per cwt., 2*s* 6*d* to 6*s*	Celery, per bunch, 6*d* to 1*s* 6*d*
— per bushel, 1*s* 6*d* to 3*s*	— Young, per bch., 1*s* 6*d* to 2*s* 6*d*
— Kidney, p. bush., 2*s* 6*d* to 3*s*	Mushrooms, per pottle, 1*s* to 1*s* 6*d*
Frame Potatoes, per lb 6*d* to 1*s* 3*d*	Small Salads, per punnet, 2*d* to 3*d*
New Turnips, per bunch, 4*d* to 9*d*	Watercress, p. 12 sm. bun. 3*d* to 6*d*
Peas, per bushel sieve, 3*s* to 5*s*	Parsley, per hf.-sieve, 6*d* to 1*s*
Red Beet, per doz., 6*d* to 1*s* 6*d*	Tarragon, Green, per bunch, 3*d* to 4*d*
New Carrots, 6*d* to 1*s* 3*d*	Green Mint, per bunch, 2*d* to 4*d*
Radishes, Tur., p. 12 bchs., 6*d* to 1*s* 6*d*	Marjoram, per bunch, 4*d* to 6*d*
Basil, per bunch, 4*d* to 6*d*	Chervil, per punnet, 2*d* to 3*d*
Horse Radish, per bundle, 2*s* to 3*s*	Cauliflowers, per doz., 2*s* to 3*s*
Savory, per bunch, 4*d*	

POTATOES.—SOUTHWARK WATERSIDE, June 3.

THE week commenced with cold and cloudy weather, with some slight showers of rain, and since the change of the moon it has set in as dry as before, with a north-east wind, with every appearance of a continuance. The supplies during the past week have been very small, which has caused a further advance in our prices, the best samples being eagerly sought after, and were sold readily at the annexed prices, and a quantity of Potatoes of various samples have been cleared out of the stores, realising a better price than was previously expected. We are still having a supply of Foreign Whites, selling at 45*s* to 55*s*.

JAMES PEARIN, Wool Broker.

SMITHFIELD, MONDAY, June 3.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3*s* 8	to 3*s* 10	Best Downs & Half-breds	3*s* 8	to 3*s* 10
Best Short Horns -	3 4	3 8	Best Long-wools - -	3 6	3 8
Second quality Beasts -	2 10	3 2	Ewes and second quality	3 2	3 6
Calves - - - -	4 4	4 10	Lambs - - -	5 0	5 6
Pigs - - - -	3 4	4 0			

Beasts, 2344; Sheep and Lambs, 33,350; Calves, 159; Pigs, 413.

We have to-day an increased supply of Beasts, and also a large attendance of buyers. We cannot make any alteration in our tabular statement from last Monday's, but the highest quotations are quite the top prices of the market. In Sheep, the supply is much greater, and the trade excessively heavy, at reduced prices. The continued dryness of the weather causes many things to come that are scarcely fit for the Butcher, and as for the same cause, there are but few buyers of that description, many remain unsold; there is, however, a fair demand for the best qualities at the prices above stated. Lamb trade is a little brisker. Veal and Pork remain about the same.

FRIDAY, June 7.

We have a good supply of Beasts, amongst which we notice about 40 Dutch; the trade is excessively heavy, and several remain unsold. In what sales are effected we do not observe any alteration from Monday's quotations; the best Scots make about 3*s* 10*d*, and the best Short-horns hardly 3*s* 8*d* per 8 lbs. We have again a very large quantity of Sheep and Lambs, and a very small demand; a great many cannot be sold, and it is difficult to realise Monday's prices for those that are disposed of. Veal is also lower, and we cannot quote more than 4*s* 8*d* per 8 lbs for the best qualities. Pork is a steady trade.

Beasts, 715; Sheep and Lambs, 12,800; Calves, 362; Pigs, 361.

41, West Smithfield.

Nitrate of Soda, 15*s* 6*d* to —*s* per cwt., duty paid . .	80	Expenses of Shipping about 5*s* to 7*s* per ton, according to quantity.	

MARK FORREST.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear roofs to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS and RICK-STANDS, or STATHELS, at very low prices.

GARDEN SYRINGES, 9*s.* 6*d.* each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 20 inches, and 22 inches.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 4 ft. 6 in., 5 ft., 6 ft., and 7 ft.

Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases in great variety, and every description of article used in Horticulture.

BEST WIRE, for STRAINED WIRE-FENCING, at 8*s.* 6*d.* per bundle of 150 to 160 yards each.

Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time.

RENDLE'S TANK SYSTEM on an improved simple plan.

Show Rooms at their Manufactory, No. 2, Winsley-street, where estimates and every information may be obtained.

AGRICULTURAL IMPLEMENTS.

DOUBLE-MOTION HAYMAKERS of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.

CAST-IRON RICK-STANDS and PIGTROUGHS, at very low prices.

IRON HURDLES AND FIELD-GATES of all sizes, at exceedingly low prices.

PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, Improved Prize Harrows, Field Rollers, Turnip-cutters, Chaff cutting Machines, Threshing and Winnowing Machines, Oil-cake Breakers, and every description of Implements used in Agriculture.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL; And by their Agents, COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL. 47, Lime-street, June 7, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

GUANO.—At the Corn Market, Mark Lane, on WEDNESDAY, 12th inst., at 2 o'clock, 100 Tons, ex GRATITUDE, Just arrived from ICHABOE. Catalogues and Particulars of WM. KIRKMANN and Co., Brokers, 2, St. Dunstan's Hill. —7th June, 1844.

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5*l.* to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt.

Phosphate of Potash, 15*s.* per cwt.
" Soda 12*s.* "
" Magnesia 9*s.* "
" Ammonia 1*s.* per lb.

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for Hire, for Excavations and Wells. Buildings heated by Hot-water, for Horticulture, and every variety of manufacturing purposes The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles, six times the size, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 50 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3-inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Millbank-street, Westminster.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade. THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much Light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *Blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., *16th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2*s.* 6*d.* and 4*s.* 6*d.*, with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-Hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

LEA AND PERRINS' WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins' Worcestershire Sauce, adapted to fish, flesh, fowl, and soup; giving a zest far superior to the long-established favourites; more wholesome and of less cost." —*Naval and Military Gazette*, April 8, 1843.

"The truth of the familiar adage, 'appetite makes the best sauce,' which ought never to have dropped from the lips of a Frenchman, is boldly disputed by Messrs. Lea and Perrins, and not without justice; for since their invention the adage is inverted, the *sauce* positively creating the *appetite*."—*The Court Journal*, April 15, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street and the principal Oil and Italian Warehousemen in London and Retail by the usual venders of Sauces.

N.B. The great celebrity of this Sauce having induced parties to prepare imitations of it, under the same or a similar name purchasers are requested to inquire for "LEA and PERRINS' Worcestershire Sauce."

IMPORTANT TO BARLEY GROWERS.

WHERE the Crops of Barley and other Lent Corn have been injured by the long-continued drought, they may be revived by a judicious application of NITRATE OF SODA, which may now be bought at a lower price than has been known for many years. To be had in any quantities of J. SOLLY LISTER, 3, Laurence-Pountney Hill, London.

NECESSARY PRECAUTION.—CONSUMERS of BRANDY are respectfully informed that J. T. BETTS, jun. and Co. will not be responsible for any bottled Brandy that is not protected against fraudulent substitution, by the Patent Metallic Capsules, embossed with the words, "Betts's Patent Brandy, 7, Smithfield Bars." Sold by the most respectable Wine and Spirit Merchants, in Town and Country, at 3s. 6d. per bottle, the bottle included.

Just published,

THE DICTIONARY of the FARM. By the late Rev. W. L. RHAM, Vicar of Winkfield, Berks; and completed by him only a few weeks previous to his death. Price 8s. 6d., strongly bound in cloth; forming a Volume of nearly 600 pages, equal to three ordinary octavo volumes.
London: CHARLES KNIGHT and Co., Ludgate-street.

In one thick vol., Eighth Edition, much enlarged, price 16s,

MODERN DOMESTIC MEDICINE: A POPULAR TREATISE, exhibiting the Symptoms, Causes, and most efficacious Treatment of Diseases; with a Collection of approved Prescriptions, Management of Children, Doses of Medicines, &c. Forming a comprehensive Guide for the Clergy, Families, and Invalids. By T. J. GRAHAM, M.D., &c. "It is evidently the result of great professional talent, experience, and judgment; the author everywhere appears conscientious and candid. *One object* is prominently evident—a sincere desire to benefit his suffering fellow-creatures. To recommend a work like the present to our readers, is only to manifest a proper regard for their welfare."—*Literary Journal, Feb.* 1843.
"It is altogether deserving of permanent popularity."—*London Weekly Review.*
SIMPKIN & Co., Paternoster-row; HATCHARDS, 187, Piccadilly; and TEGG, Cheapside. Sold by all Booksellers.
Also, by the same Author, in 8vo, price 11s., Third Edition, enlarged,

ON THE DISEASES OF FEMALES: a Treatise illustrating their Symptoms, Causes, Varieties, and Treatment. With numerous Cases, and a Medical Glossary. Including the Diseases and Management of Pregnancy and Lying-in.
"It contains a mass of information indispensable to those for whom it is intended, and surpasses in value any other book of its character.—*Blackwood's Lady's Magazine.*

WORKS PUBLISHED BY W. S. ORR & CO.

I.
GREECE, PICTORIAL, DESCRIPTIVE, and HISTORICAL, by CHRISTOPHER WORDSWORTH, D.D., Head Master, Harrow. Price A GUINEA AND A HALF, cl., lettrd.

II.
TRAITS AND STORIES OF THE IRISH PEASANTRY. By WILLIAM CARLETON. With an Autobiographical Introduction, Illustrative Notes, and Graphic Illustrations on Wood and Steel. Now complete, in 2 vols., medium 8vo. Price 26s., cloth, lettered.

III.
PICTORIAL HISTORY OF FRANCE, from the Establishment of the Franks in Gaul, to the period of the French Revolution, by G. M. BUSSEY, and THOMAS GASPEY—enriched with 400 Designs on Wood, by Jules David. 2 vols., super royal 8vo., price 30s.

IV.
THE ILLUSTRATED SHAKSPERE (TYAS's). The text revised from the best authorities. A Memoir and Essay on Shakspere's Genius, by BARRY CORNWALL. Introductory Remarks on each Play by some distinguished writer, with beautiful characteristic Designs on Wood, by Kenny Meadows. In 3 vols., imperial 8vo., price 3l. 3s., cloth.

V.
IRELAND BEFORE AND AFTER THE UNION WITH GREAT BRITAIN. By R. MONTGOMERY MARTIN, Esq. Price 10s. 6d., cl., lettered.—Amen Corner, Paternoster Row.

Just published, 3d edit., corrected and improved; fcap. 8vo, 6s.

RIVERS' ROSE AMATEUR'S GUIDE, containing ample Descriptions of all the fine leading Varieties of Roses, with the Modes of Cultivating them.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

Just published, the Second Edition.

A PRACTICAL TREATISE on the IMPORTANT VALUE of PERUVIAN and ICHABOE AFRICAN GUANO, the most powerful, portable, and cheap Manure in the World. Interspersed with appropriate Rules, and Application of Genuine Guano, arranged for all soils, growth, and rotation of Crops. To be had of the Author only, by letters prepaid, inclosing 1s., when a Copy will be posted prepaid.
All letters to be addressed to W. A. HARWOOD, 10, Sparling-street, Liverpool. N.B. Genuine Guano ex ship, 11l. to 12l. per ton; orders for 2 cwt. and upwards executed.

BREEDING, FEEDING, FATTING, AND DISEASES OF SHEEP.

Chiefly for the use of those interested in the Allotment System. Price 1s. 3d.

THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2s. cloth.

THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Person. Price 2s. cloth.

THE HAND-BOOK OF THE LAUNDRY;
Expressly intended for those who "wash at home." Price 1s. 9d.

THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1s. 9d.

In one small volume, price 15s.,

PAXTON'S POCKET BOTANICAL DICTIONARY.
In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.
Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

Bound in cloth, price 5s. 6d.

JOE MILLER'S JEST-BOOK.
A Reprint from the first and genuine Edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.
Extract from the Preface.
"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."
London: WHITTAKER and Co.

PRINTED FOR
TAYLOR AND WALTON,
BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,
UPPER GOWER-STREET.

DARLEY'S
SCIENTIFIC LIBRARY,
FOR THE USE OF
SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.
A NEW EDITION (being the fifth) *is now in the Press,*
A SYSTEM
OF
POPULAR GEOMETRY;
Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.
BY GEORGE DARLEY, A.B.
Price 4s. 6d., cloth.

II.
NEW EDITION (just published),
COMPANION
TO THE
POPULAR GEOMETRY;
In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.
BY GEORGE DARLEY, A.B.
Price 4s. 6d., cloth.

III.
THIRD EDITION,
A SYSTEM
OF
POPULAR ALGEBRA;
WITH
A Section on PROPORTIONS and PROGRESSIONS.
BY GEORGE DARLEY, A.B.
Price 4s. 6d.
"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.
SECOND EDITION,
A SYSTEM
OF
POPULAR TRIGONOMETRY,
Both Plane and Spherical.
With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.
BY GEORGE DARLEY, A.B.
Price 3s. 6d., cloth.

V.
FAMILIAR ASTRONOMY.
BY GEORGE DARLEY, A.B.
WITH ENGRAVINGS.—12mo, 5s., cloth lettered.
"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Printed by WILLIAM BRADBURY, of Stoke Newington, and FREDERICK MULLET EVANS, of No. 7, Church-row, Stoke Newington, both in the county of Middlesex, printers, at their office in Lombard-street, in the precinct of Whitefriars, in the City of London; and published by them at the office, No. 5, Charles-street, in the parish of St. Paul's, Covent-Garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 8, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—

Trustees.

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

PROVIDENT LIFE OFFICE, 50, REGENT STREET, FEB. 15, 1844.
BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued. GEORGE BEAUMONT, Actuary.

HORTICULTURAL IMPROVEMENT.—As Spring approaches the larvæ of destructive insects are propagated in infinite multitudes, to the great injury of the young shoots of choicest trees and plants, particularly in Forcing-houses, and, indeed, every species of vegetation put in motion and growth by the genial influence of the season.

J. READ begs to inform Ladies, Amateur and Practical Gardeners, that he has made considerable improvements in his MACHINES and SYRINGES for the purpose of subduing these destructive insects which make such deadly havoc on all choice trees and plants at this season of the year, as they will live in any degree of heat, but perish by moisture. These machines, for power and portability, surpass anything of the kind ever offered to the public, which the Patentee, (from thirty-one years' practice in the science of Horticulture, and twenty-four years' in manufacturing and improving Instruments) can safely warrant. May be seen and proved at 35, Regent-circus, Piccadilly, London.

N.B.—None are genuine except stamped with the royal arms and the words "READ's Patent."

BERDOE'S SUPERIOR REALLY WATERPROOF FROCKS, for the present season. An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

News of the Week.

THE arrival of the Emperor of Russia in this country on a visit to the Queen, is the great topic of the day, not only in home circles, but on the Continent. His Majesty's visit was at once sudden and unexpected; and his appearance amongst us at a moment when the French papers are discovering fresh schemes on the part of Russia for the immediate overthrow of our Indian Empire, is not the least curious of the many considerations suggested by his visit. In France, the appearance of the Czar at the Court of England is considered too important an event to be unconnected with matters of European policy, and the strangest speculations are put forth by the Paris papers on its probable issue. At home, too, the Emperor's visit has caused some embarrassment in regard to the Polish Refugees in London, and still more so in regard to the Polish Ball, which has been for some time appointed to take place on Monday next. Some of the supporters of the Ball were anxious to defer it, as a mark of courtesy to his Majesty; while others, and as it appeared the majority, considered that such a step would be a compromise of principle, as little complimentary to the Emperor as to the supporters of the Charity, and the Ball will consequently take place on the day originally appointed—the day, however, on which his Majesty will take his departure from England. The King of Saxony is also in London on a visit to the Queen; and the Crown Prince of Denmark is in Scotland. The object of their visits is understood to be connected with scientific pursuits, and although their movements have less political consequence than those of our Imperial guest, they are sure to command respect from all who know the active interest taken by these Royal visitors in the sciences of Geology and Botany. In Parliament during the week several important measures have been under discussion. In the Lords on Monday, the Factories Bill was read a third time and passed without a division, the 32d clause, limiting the period of labour to 12 hours, having been affirmed at a previous sitting by a majority of 21 to 48. The Customs Duties Bill was also passed on the same night, after a protest from the Duke of Richmond against the abolition of the duty on foreign wool. On Thursday, the House threw out, by a majority of 31 to 20, Sir Thomas Wilson's Bill for disposing of Hampstead Heath for building purposes. This measure had for some time caused alarm to the inhabitants of London, to whom that delightful spot has so long afforded the means of healthy recreation, and the rejection of the Bill will doubtless be received with satisfaction by the whole metropolis. In the Commons on Monday, the Government resolutions with respect to the Sugar Duties, were passed by a majority of 69; on Tuesday Lord H. Vane's motion for an immediate repeal of the duty on coal was negatived by a majority of 36; and on Thursday, the second reading of the Dissenters' Chapel Bill was carried by a majority of 190. On Wednesday, Lord Worsley brought forward his Commons Inclosure Bill, and on his suggestion it was committed *pro formâ*, with a view to improvement and subsequent alterations by the Government.

From France we have the important announcement that a war is on the point of breaking out between the French forces in Algeria and the Emperor of Morocco. At the date of the last advices the armies of the two powers were in sight of each other, and the troops of Morocco were commanded by Abd-el-Kader, the old enemy of France. These preparations have caused much excitement in Paris, and before the European Powers can effect a mediation, it is more than probable that a collision will have taken place, and the foundation be thereby laid for the ultimate annexation of Morocco to the French colony of Algiers.—The India Mail has arrived this week, but the only important news is the murder of Soochet Singh by his uncle, Heerah Singh, who had invited him to Lahore, and treacherously murdered him as he was entering that city.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the King of Saxony, left Buckingham Palace on Monday for Windsor Castle. The Emperor of Russia arrived at the Castle in the afternoon of the same day. The Queen, accompanied by her Royal visitors, was present at the Review in Windsor Park on Tuesday; and on Thursday Her Majesty was present at Ascot Races. The other movements of the Court are described in the following account of the Emperor's visit. Her Majesty and the Prince came to town yesterday, and will honour the Opera with their presence this evening, accompanied by the Emperor of Russia, the King of Saxony, and a numerous suite. The Countess of Gainsborough has succeeded Viscountess Canning as the Lady in Waiting on the Queen, and Viscount Sydney has succeeded Lord Byron as the Lord in Waiting.—The Queen Dowager left town on Monday, by the South Eastern and Dover Railway, for the Continent. Her Majesty landed at Calais on the afternoon of the same day, and was received with the usual honours by the French authorities.—The Duchess of Kent arrived at Strasburg from Bâsle on the 31st ult., on her way to Germany. Her Royal Highness will probably return to England about the 20th or 21st inst., arriving in this country some days previously to the accouchement of her Majesty, which is expected to take place early in July.—In reference to the statements lately current respecting certain retrenchments in the Royal Household, the *Times* states that "they are all, without exception, destitute of any foundation. Amongst the number of attendants that it has been found necessary to place upon the retired list, there are some whose conduct, so far from entitling them to complain of the amount of pension awarded to them, has not entitled them to any retiring allowance. There are others still retained in the Royal service whose conduct has not been satisfactory, and from those sources may be traced those misrepresentations which have been forced into public notice."

VISIT OF THE EMPEROR OF RUSSIA.—His Imperial Majesty, Nicholas, Emperor of all the Russias, attended by General Count Orloff, and a numerous suite, left Rotterdam on Friday afternoon, for England, in the Dutch Government steamer Cyclops, Captain Balken, and arrived off the royal dockyard at 10 minutes to 10 o'clock on Saturday evening. His Majesty's intention to visit this country was only known on the previous day. His Majesty was received by the authorities of the dockyard, by Baron Brunnow, the Russian Minister, the Russian Consul General, &c., and immediately proceeded to London. The Emperor having expressed a wish, through Baron Brunnow, that his arrival at Woolwich should take place as privately as possible, no royal salute was fired when his Majesty landed, nor was there any guard of honour in attendance. The Emperor took up his residence at Ashburnham House, the seat of the Embassy, where he slept that night. On Sunday morning his Imperial Majesty rose early, breakfasted before 9, and walked in the gardens of the Embassy. At half-past 9 Prince Albert arrived on a visit to the Emperor. His Imperial Majesty was in the act of descending to receive his Royal Highness, when they both met on the grand staircase. Their meeting was of the most cordial character. The Emperor threw his arms round the neck of the Prince, and embraced him fervently, Prince Albert returning his salute with great apparent feeling. The Emperor then led the Prince into the drawing-room, where they remained in conversation for a considerable period. The Emperor inquired affectionately after the Queen, and expressed his hope that his sudden arrival in England would not be allowed to inconvenience her Majesty and the Prince in any way—adding that he purposed to remain at any rate for a short period in the house of the Embassy. The Prince upon this intimated that no inconvenience could possibly result by the Emperor's immediate removal to the palace. Apartments had already been prepared, and it was Her Majesty's earnest desire that the Emperor should at once remove thither with the whole of his suite. At 10 o'clock the Prince took his departure, promising to return at half-past 1 for the purpose of escorting the Emperor to Buckingham Palace on a visit to Her Majesty. Shortly before eleven, the Emperor, accompanied by General Count Orloff, Baron Brunnow, and other members of his suite, left Ashburnham House, to attend divine service at the chapel of the Russian Embassy, in Welbeck-street. At half-past one o'clock, Prince Albert returned to the Embassy, and escorted the Emperor to Buckingham Palace. On arriving at the Palace the Emperor was presented to Her Majesty by Prince Albert. His Imperial Majesty subsequently partook of a *dejeûner* to which the Queen invited him, and afterwards paid a visit to the King of Saxony, in his apartments at the Palace. The Emperor, accompanied by Prince Albert, then paid visits to the Queen Dowager, the Duke and Duchess of Cambridge, the Duchess of Gloucester, and the Duke of Wellington. The Duke descended to the hall to receive his Imperial Majesty and the Prince, himself conducting them to the splendid saloon on the first floor of the mansion. The Emperor appeared delighted to meet the gallant Duke, and after shaking hands very cordially with him, entered

into conversation for some minutes, complimenting his Grace on the splendour of his mansion and its appurtenances. Thence the royal party drove back to the Embassy where the Emperor alighted and took leave of the prince. At half-past four the Emperor retired to his private apartment, and, being excessively fatigued from the exertions of the last few days, fell into a sound sleep, from which he did not awake until nearly six o'clock. During this interval the King of Saxony called at the Embassy. The King would not allow the Emperor to be disturbed, and left Ashburnham House without seeing his Majesty. The Duke of Cambridge likewise called shortly after the King of Saxony had taken his departure, and also left without seeing the Emperor. At 8 P.M., his Imperial Majesty and his suite proceeded to Buckingham Palace, to dine with the Queen, and returned to sleep at the Embassy. The Emperor retired to his private apartment shortly after his arrival, and was subsequently closeted for some time with his Excellency Baron Brunnow. At half-past eleven, a courier charged with despatches from the Emperor, left the Embassy direct for St. Petersburgh. At a late hour his Majesty took coffee with his Excellency, and retired to rest soon after midnight. On Monday morning the Emperor rose at seven o'clock, breakfasting very shortly afterwards in his private apartments alone. Soon after ten his Imperial Majesty, attended by Baron Brunnow and the Secretary to the Legation, proceeded to Messrs. Mortimer and Hunt's (late Storr and Mortimer), the jewellers, in Bond-street, for the purpose of inspecting their magnificent stock of jewellery and plate. The Emperor remained in the establishment for upwards of an hour, and made many valuable purchases of jewellery and gave several orders for services of plate. The fact that his Majesty was stirring, and had honoured Messrs. Mortimer with a visit, soon spread throughout the west end of town, and a very large number of persons had assembled in the neighbourhood when the Emperor entered his carriage. Here the first hearty welcome which he had experienced from an English crowd met his ear, the assembled multitude joining in a general burst of cheering. The Emperor frequently acknowledged the hearty manifestations of the people, and immediately drove off in the direction of the Regent's Park, arriving at the principal entrance of the Zoological-gardens at 12 o'clock. The Royal visit to this place was altogether unexpected, no preparation had been made, nor was any person in attendance to receive his Majesty. The Emperor passed through the subscribers' entrance with Baron Brunnow, and spent a considerable period in the grounds, visiting successively all the attractive features of the place, and lastly inspecting the giraffes, with which the Emperor expressed himself much pleased. On his return his Majesty paid visits to Lady Heytesbury, the Countess of Pembroke, Sir Robert and Lady Peel, the Marchioness of Clanricarde, and the Marquis of Anglesea, returning home at two o'clock. His Imperial Majesty then prepared to receive the Duke of Devonshire, who had been honoured with an invitation to lunch with the Emperor at three o'clock. His Grace arrived at Ashburnham House a few minutes after three. His Grace was attired in a plain dress suit, and wore the blue Russian riband, with the order of St. Andrew suspended beneath. A splendid *dejeûner* had been prepared by Baron Brunnow's household for the entertainment of the Duke. The Emperor entered the saloon a few minutes after the Duke's arrival, and took a seat opposite his noble guest. The Emperor was engaged in conversation with the Duke of Devonshire during the whole period of his Grace's visit, and upon the latter departing, his Imperial Majesty was pleased to express his intention of honouring the Duke with a visit at his Grace's villa at Chiswick before he left England. At this period of the day Dover-street was literally crowded with the carriages of noblemen and gentlemen desirous to pay their respects to the Emperor by entering their names in a book kept for that purpose. A large number of well-dressed persons filled the foot pavement on either side, and the windows of all the mansions in the neighbourhood commanding a glimpse of the court-yard of Ashburnham House were thronged with fashionably-dressed ladies. About six o'clock the Emperor and his suite left in the Queen's carriages with the servants in state liveries for the Paddington terminus of the Great Western Railway. On his departure from Dover-street and on his arrival at Paddington, his Imperial Majesty was enthusiastically cheered. The train reached Slough in 25 minutes. The Emperor was met at Slough by Prince Albert, who conducted him to Windsor Castle, where they arrived shortly before seven, all the great officers of state being in attendance to receive his Majesty at the entrance of the Castle. A grand dinner afterwards took place in the Waterloo Gallery, at which nearly all the Ministers were invited to meet the Emperor. On Tuesday his Imperial Majesty, the King of Saxony, and Prince Albert honoured Ascot races with their presence, returning to the Castle to dinner. On Wednesday the Emperor reviewed a select body of the Cavalry and Infantry at present quartered in the neighbourhood of London. Nothing could surpass the scene as a spectacle. The town of Windsor was literally swarming with visitors whom every successive train had brought down from London by the railway. The Infantry, consisting of the 47th Reg., the 2d battalion of Grenadier Guards, the 2d battalion of Coldstream Guards, and the 2d battalion of Scotch Fusilier Guards, were drawn up in a long double line, flanked at each extremity by the Cavalry and the Artillery. The former comprised the Royal Horse Guards Blue (two troops), the 1st Regiment of Life Guards, and the 17th Lancers; while the latter consisted of the Royal Horse Artillery, and a battery of Field Artillery. At half-past ten the troops were formed into line, the Royal Artillery under the command of Colonel Cleaveland, the Cavalry under Major-General Lygon, Colonel of the 10th Hussars, and the infantry under Major-General Lord Saltoun, in readiness to receive the Emperor with military honours. Soon after eleven her Majesty arrived on the ground in a carriage and four, accompanied by his Imperial Majesty, the King of Saxony, Prince Albert, The Duke of Cambridge, the Duke of Wellington, Sir R. Peel, and a brilliant staff on horseback. The Prince of Wales and the Princess Alice followed in a carriage and four accompanied by attendants. The Emperor was received on the ground by General Viscount Combermere, who had the command of the troops, and on his Imperial Majesty approaching the line he was saluted in the usual manner, the bands of all the regiments playing the national anthem. Her Majesty the Queen remained in the royal carriage, the horses being withdrawn, to prevent any fear of danger should they have become alarmed on the firing. The Emperor was loudly cheered when he came upon the ground. He was dressed in a dark green uniform (almost black) trimmed with red, and wore a black helmet with a plume of white feathers, and the riband and star of the order of the Garter. His whole appearance was commanding in the extreme, and it was evident that report had not been an undue flatterer in describing him as one of the finest men in Europe. His Imperial Majesty and the King of Saxony proceeded along the line, accompanied by the brilliant staff, and on returning to the station, where her Majesty and attendants were placed, the whole of the troops marched past at slow time, and the precision of the men and military appearance of all the regiments, and the fineness of the weather, gave the scene an imposing effect. The splendid band of the 1st Regiment of Life Guards came first, playing "British Grenadiers," succeeded by the troops in the following order:—General Viscount Combermere, Colonel of the 1st Regiment of Life Guards, with Colonel the Hon. F. C. Cavendish and the regiment; General the Marquess of Anglesea, Colonel of the Royal Horse Guards, with Colonel Richardson and the regiment, headed by their band and silver kettle drums. General the Right Hon. Sir George Murray, Master-General of the Ordnance and Colonel of the Royal Regiment of Artillery, with Colonel Cleaveland and the Royal Horse Artillery. Lieutenant-Colonel St. Quintin and the 17th Lancers. Field-Marshal the Duke of Wellington, Colonel of the Grenadier Guards, with Colonel Lascelles and the second battalion. When his Grace passed he was enthusiastically cheered along the whole line by the delighted spectators. Field-Marshal H.R.H. the Duke of Cambridge, Colonel of the Coldstream Guards, with Colonel Bentinck and second battalion. Field-Marshal H.R.H. Prince Albert, Colonel of the Scotch Fusiliers, with Colonel Drummond and the second battalion. General Sir W. Anson, Bart., Colonel of the 47th Foot, with Lieut.-Colonel Dundas and the regiment. The Colonels of the respective regiments, on marching past the Emperor, left and joined his Imperial Majesty. On the Duke of Wellington joining, the Emperor shook his Grace cordially by the hand. The whole of the Household Cavalry and the 17th Lancers, and the field battery of the Royal Artillery marched past a second time, at a trot, and with excellent regularity. The whole of the troops again formed in line, and marched forward to the front, and commenced a running fire, the cavalry deploying at a trot to the right. The infantry formed squares, firing with the front rank kneeling, and again forming into line, and marching to the rear, and went through their evolutions in an effective and soldier-like manner, apparently to the entire satisfaction of his Imperial Majesty, who, at the conclusion, thanked Viscount Combermere, and then left the ground about twenty minutes past one o'clock. Her Majesty left the review ground at half-past twelve, with the Prince of Wales and Princess Alice, and before the forward running fire commenced. Her Majesty was loudly cheered on arriving at and leaving the ground, and during the review entered into conversation for a long period with Sir R. Peel, who was also loudly cheered by the spectators. The number of distinguished officers, belonging to the British service, on the ground was very great, and there were several foreign officers, the whole presenting a brilliant and highly pleasing spectacle. At five o'clock the Royal party left the Castle in open carriages, for Virginia Water. The Emperor and Prince Albert in a pony phaeton and pair, his Royal Highness driving; three carriages and four followed, in which were the King of Saxony, the Duke and Duchess of Cambridge, the Duchess of Buccleuch, the Baroness Ahlefeldt, Lady C. Cocks, and the Hon. Miss Devereux. A number of gentlemen, and the equerries in waiting, attended on horseback. The royal party visited the fishing temple, and returned from Virginia Water soon after seven o'clock in the evening. The dinner was served in state in the Waterloo Gallery. On Thursday his Majesty accompanied the Queen and Prince Albert, and the King of Saxony to Ascot Races. Previous to their departure the Emperor and Prince Albert visited St. George's Chapel, and inspected the Royal Stables. His Imperial Majesty accompanied her Majesty to town yesterday, and visited the New Houses of Parliament and Westminster Hall in the afternoon, accompanied by the King of Saxony. A grand entertainment was given in the evening at Buckingham Palace, to the Foreign Ministers and a select party of the nobility, who were invited to meet the Emperor. This day, his Grace the Duke of Devonshire gives a *fête* at his villa at Chiswick, to his Imperial Majesty and the King of Saxony, and this evening the Emperor will accompany the Queen to the Italian Opera, where the "Barbiere di Seviglia" and "Ondine" have been appointed for the entertainments, as the performances embracing the greatest number of first-rate artists and the most striking attraction. The Emperor will leave England on Monday, and the Black Eagle steamer is now at Woolwich preparing to convey his Majesty to the Hague.

THE KING OF SAXONY.—His Majesty, as stated in our last, arrived at Portsmouth from Buckhurst Park on Friday evening, and took up his quarters at the residence of the Port Admiral, under a Royal salute from the men-of-war and batteries. A select party was invited to meet the King at dinner, after which he retired to rest at an early hour, and breakfasted on Saturday morning at half-past 7. After breakfast, His Majesty visited the dockyard, the Collingwood line-of-battle ship, the Victoria and Albert steam-yacht, the block machinery, smithery, and the different vessels now on the stocks. His Majesty then visited the Prometheus steamer, the Victualling Yard, and the Victory, which was decorated with her colours from stem to stern, and had the Royal standard flying from her mainmast. As His Majesty stepped on board, the yards were manned, and a Royal salute fired at the same moment. The King was received by Captain Henderson, and by that officer conducted over the ship. His Majesty minutely examined every part of the vessel—the well-known spot where Nelson fell, and the cabin in which he died. Some of the crew were at dinner when His Majesty came on board, and the Royal visitor appeared much pleased with the excellent discipline and order that prevailed. His Majesty drank the Queen's health in some of the sailors' grog, and was much amused at the dexterity of one of the crew, who slung his hammock, and exhibited the manner of "turning in" to the Royal party. His Majesty left the Victory shortly after 12 o'clock, under a Royal salute, the yards being again manned, and landed at the King's-stairs, from whence the Royal party returned to the Admiralty-house, where a *dejeûner* had been prepared. His Majesty embarked soon afterwards in the Admiral's yacht Fanny, under the command of Lieut. Prevost, for the Isle of Wight, and sailed out of the harbour under a Royal salute from the batteries and vessels in the port. Proceeding towards Ryde, the King was afforded an excellent opportunity of observing the St. Vincent line-of-battle ship, Captain Rowley, which was under orders to proceed to Plymouth, had not yet weighed anchor when the Royal party approached in the yacht. She had partially unfurled her topsails, and was about to get under weigh, when the Fanny was observed close at hand. A Royal salute was immediately fired in honour of his Majesty, and by the especial request of the King, Lieut. Prevost brought the Fanny close under the stern of the St. Vincent, and subsequently tacked three or four times round her. During this period the crew were actively engaged in weighing the anchor, and setting all sail to proceed down Channel. His Majesty paid minute attention to the tactics of the seamen, and as the breeze was only moderate, ample time was afforded for that purpose. In about 20 minutes from the signal being given by Captain Rowley, the anchor was up—all sails set—and the splendid ship was seen to the greatest possible advantage, beating down Channel to the eastward. The Admiral's yacht rounded the St. Vincent once after that ship was under weigh; and as she stood across towards Ryde, the band of the Marines, stationed on the main deck, played the national anthem, the crew joining in three cheers for the King of Saxony. Soon after 3 p.m. his Majesty landed at Ryde Pier, and proceeded by Westridge and Brading to Shanklin. Here his Majesty alighted from his carriage, and walked down Shanklin Chine to the beach, expressing great admiration at the scenery of the coast. The King then proceeded through Bonchurch, Ventnor, and St. Lawrence to Niton, and thence past St. Catherine's Point to Black Gang Chine. His Majesty then proceeded northward across the island, in the direction of Newport, passing Godshill Church, the village of Rookley, Gatcombe Park, and Carisbrooke Castle, at which the King desired to alight, but the evening had already so far advanced, that it was deemed prudent not to do so, and the *cortège* passed rapidly through Newport, taking the direct road by Parkhurst Barracks to Cowes, at which place the King arrived about half-past 8. The King entered the grand saloon of the Yacht Club-house, where dinner had been prepared, at 9 o'clock, and took his seat at the table with the various members of his suite; Lieut. Prevost, acting commander of the Fanny yacht, being the only stranger honoured with an invitation to join the King. His Majesty was at breakfast on Saturday morning at half-past 5, and at 6 re-embarked on board the yacht, under a salute from the Royal Yacht Club-house and the various ships and yachts lying in the harbour, among which were one Russian and three Swedish brigs. In consequence of the very early departure of the King few persons were about, and the Royal party therefore left the island comparatively unobserved, and proceeded down Channel, to enable his Majesty to inspect the Geological formations of Alum Bay and the Needles. The King then proceeded direct to Southampton in tow of the Echo steamer, and was received on landing by the Mayor, and authorities of the railroad, and by an immense concourse of spectators by whom he was loudly cheered. While the special train was coming up to convey his Majesty to town, Lieut. Prevost informed him of the expected arrival of the Emperor of Russia. The King appeared astonished at the intelligence, and his surprise was hardly

removed when he saw the *Times* newspaper, containing the announcement that the Emperor was expected in London that evening. The train reached Vauxhall, 77¼ miles, in 1 hour and 42 minutes. His Majesty was received at the station by Prince Albert, by whom he was cordially welcomed, and the Royal party reached Buckingham Palace shortly before 6 o'clock. On Sunday morning the King visited the Queen Dowager and other members of the Royal Family, and called on the Emperor of Russia, at Ashburnham-house. On Monday morning his Majesty visited Caen Wood, the house and grounds, and after partaking of a *dejeûner* proceeded to the Zoological Gardens. After viewing the collection, the King returned to the Palace and accompanied her Majesty and Prince Albert to Windsor Castle. On Tuesday his Majesty accompanied Prince Albert and the Emperor of Russia to Ascot Races, and on Wednesday was present at the review in Windsor Park. On Thursday morning his Majesty, attended by his Minister, attended mass at the Roman Catholic chapel at Clewer. His Majesty afterwards accompanied Prince Albert on a visit of inspection to his Royal Highness's farm, and honoured Ascot Races with his presence in company with the Queen and the Emperor of Russia. The King arrived in town yesterday with the rest of the Royal party, and accompanied the Emperor of Russia to the new Houses of Parliament and Westminster Hall. Shortly before 6 o'clock, his Majesty entered the House of Commons and sat in the chair usually occupied by the Serjeant-at-Arms. Sir Robert Peel was in close conversation with his Majesty during his stay, evidently pointing out to the King the construction of the house and the principal members on both sides. His Majesty appeared to take great interest in the proceedings. It is said that his Majesty will leave town in a few days and make a tour, for three weeks or a month, through the provinces, which it is not improbable may be extended to the mining districts in the Welsh counties, and also to a portion of the more southern Scotch counties, including the cities of Glasgow and Edinburgh.

ARRIVAL OF THE CROWN PRINCE OF DENMARK.—On Friday, his Danish Majesty's frigate Gafien, 48 guns, arrived in Leith Roads, having on board the Crown Prince of Denmark. Count Reventlow, the Danish Minister, embarked at Granton in a steamer to receive his Royal Highness, who landed soon afterwards under royal salutes from the forts and shipping. His Royal Highness landed at Granton-pier, where he was received by Sir W. Bain, pier-master, the Lord Provost of Edinburgh, and the Collector of Customs. His Royal Highness took up his residence at Douglas's Hotel, and afterwards took a short walk through the city in company with the Danish Minister. His stay in Edinburgh is limited to a few days, when he starts on a short tour through the Highlands. He afterwards proceeds to the Faroe Islands upon a geological tour.

Parliamentary Movements.—A vacancy has occurred in the representation of Enniskillen, the Hon. A. Cole having accepted the Chiltern Hundreds.

Foreign.

FRANCE.—The visit of the Emperor of Russia to this country has caused the utmost astonishment in Paris. The Opposition papers are filled with conjectures on the object of the visit. Some regard it as a proof of a hostile alliance against France, others as an intentional insult to the French Cabinet, and as a plea for further concessions, while others even go so far as to predict some extensive scheme against the liberties of Europe! The Emperor's visit has caused the more surprise as the Paris papers have lately been describing some deep-laid plan by which Russia had arranged the downfal of our Indian Empire! M. Horace Vernet, the celebrated French painter, left Paris for London, on Monday, to pay his respects to his Imperial Majesty, "one of the illustrious patrons of that distinguished artist." It is stated however that M. Vernet's visit has not merely this complimentary object, but that he is charged with a confidential and *quasi* political mission of an exceedingly delicate nature, namely, "to second the rumoured undertaking of her Majesty the Queen of England to bring about a good understanding between the Emperor of Russia and the King of the French."—Important news has been received from Algeria. According to these advices, the Emperor of Morocco has preached and proclaimed a "Holy War" against France, and a considerable French force had moved to the frontiers of Morocco, which a large corps of Moors had likewise approached. These preparations were considered in Paris to denote that France is on the eve of a war with Morocco, which will probably result in the subjugation of that empire, and its annexation to the French colony of Algiers. According to the French account of the affair, it appears that while Marshal Bugeaud was busy carrying out his expedition against the Kabyles of Jurjura, it was discovered that the old enemy of France, Abd-el-Kader, supported by the Emperor of Morocco, was preparing an expedition to invade the French territory in the neighbourhood of Oran; and it is added that the Emperor of Morocco, Muley Abd-er-Rhaman has proclaimed a holy war against France, and that one of his sons, at the head of 10,000 men, has already joined the Emir Abd-el-Kader, both being prepared to make a joint and formidable invasion of the French territory. In the accounts given in the Paris papers of this affair, the cause of quarrel is left doubtful, one account stating that it had its origin in a disputed boundary; another, that the Emperor of Morocco had taken umbrage at the French because he believed that they intended to take a part against him in his dispute with Spain.—We stated in our last that the debate on the supplementary credits still occupied the Chamber, and that M. Thiers had attacked the Government on their conduct at Monte Video, and on the manner in which the safety and interests of the French inhabitants in that region were neglected. The speech of M. Thiers appears to have made a deep impression on the Chamber, and M. Guizot declared that the question was put in so serious a light, and implicated so deeply the principles of the foreign policy of the Government, that it required a complete development. He accordingly moved the adjournment of the debate till the following day, which was at once agreed to. M. Odillon Barrot, however, having remarked that Thursday was the day fixed for the funeral of M. Laffitte, it was resolved unanimously that, as a mark of respect to "one of the founders of the Government," the Chamber should abstain from all public business upon that day, and the debate was accordingly adjourned till Friday, when M. Guizot replied to M. Thiers, making a long and able defence of the Government against the charges brought against it, after which M. Thiers replied, but declined pressing the question to a division, on the ground that he was unwilling to make the safety of the French subjects at Monte Video depend upon anything so uncertain as the result of a vote of the Chamber. The vote for the supplementary credits demanded by the Minister of Foreign Affairs, upon which the Monte Video debate was hung, was accordingly passed without a division. On Saturday the supplementary credits of the Home and Commerce departments were voted, with very little discussion worth noticing. M. Guizot, in reply to M. de St. Marc Girardin, said that formal instructions had been sent to the French Ambassador at Constantinople to interfere in behalf of the Christians of Albania, and put an end to the dreadful disturbances which have of late occurred in that quarter. The subsequent proceedings in the Chamber were of no particular interest, the debate upon the navy having been postponed till the navy estimates should come regularly before the Chamber.—The funeral of M. Laffitte took place on Thursday with almost royal honours. As a spectacle it must have been most imposing. The shops were closed; three members of the Cabinet, nearly the whole Chamber of Deputies, and a great number of the Peers attended the funeral. The hearse was guarded by the grenadiers of the National Guard, and several regiments of cavalry and infantry were in the procession. The pall was borne by the President of the Chamber of Deputies, M. Arago, M. Odillon Barrot, and a Regent of the Bank of France. The Prince of Moskowa, son of Marshal Ney, was the chief mourner. These were followed by a deputation of the electors of Rouen, of the schools of medicine and law, and of the mechanics, in uniform. Then followed the friends of the deceased to the number of ten thousand, the procession on foot alone extending for more than a mile. The carriages followed. Three of the King's carriages and the carriages of the Duchess of Orleans and Duke of Nemours attended, besides 24 mourning carriages, and between 300 and 400 private carriages. The carriages of the Royal family were escorted by a squadron of the Municipal Guard and the 70th and 71st Regiments of the Line. The whole of this immense procession was closed by a battalion of infantry, two battalions of the National Guards, and a regiment of Hussars. The funeral service was performed by the Archbishop of Paris. Six orations were delivered over the grave—the first by his brother, M. Pierre Laffitte; the second by M. Arago; the third by M. Visinet, in the name of the electors of Rouen, of which M. Laffitte had been the representative in the Chamber of Deputies; the fourth by M. Garnier Pages, one of the leaders of the Republican party; the fifth by M. Gouache, in the names of the students; and the 6th by M. Dupin. It was calculated that between those who took part in the procession and the spectators there could not have been much less than half a million of persons assembled. The weather was beautiful, and the whole ceremony passed off without any disturbance or confusion beyond what must necessarily take place when the whole population of a great capital assemble. There is a national subscription to be opened immediately to raise a monument to the memory of M. Laffitte.—The papers state that the celebrated Madame Lamotte, who was concerned in the affair of the diamond necklace of Queen Marie Antoinette, and was sentenced to be branded on both shoulders, flogged through the streets of Paris, and be confined for life in the Saltpetrière, from which place she made her escape, lately died in one of the hotels of the Faubourg St. Germain, in the 80th year of her age. During upwards of 30 years the Countess contrived to escape unnoticed, and was only recognised after her death.

SPAIN.—We have accounts from Madrid to the 28th ult. In the absence of the Queen, the Progresistas were busy spreading alarming reports, such as that her Majesty had fallen seriously ill on her journey. The last accounts, however, state that her Majesty entered Barcelona on the 2d, after making a short stay at Tarragona and Valencia, at all which places she was received with great enthusiasm. The Moderado party had finally prevailed in the Madrid elections. The Barcelona papers state that 12 more Carlists were shot at Morella on the 19th, among whom were two officers, a captain, and a lieutenant, who had served under Cabrera. Since the 15th of April 120 Carlists had been shot in Catalonia. A Madrid letter states that an important communication had just been made by the Finance Minister to the Tobacco Company. It was to the effect that he had resolved to rescind their contract. This notification and breach of faith were expected to create a deep sensation in the capital.

PORTUGAL.—Accounts from Lisbon of the 18th state that the term of the suspension of the freedom of the press expired on the 23d ult. The said freedom was in being two days, when, on the plea of the absence, flight, or imprisonment of some of the persons who were guarantees for the editors, the publication of the papers was again stopped, and the distributors of the papers already published were arrested and imprisoned. Two of the papers re-appeared on the 28th.—A Portuguese woman, in the island of Madeira, named Maria Joaquina, was recently condemned to suffer death solely on account of her having embraced the doctrines of the Protestant faith, nothing else having been brought against her than her denial of worship to images, and of the doctrine of transubstantiation. The circumstance has caused great excitement among the British Protestants, and Lord Aberdeen has called upon the Portuguese Cabinet to prevent such a sentence from being carried into effect.

SWITZERLAND.—We learn by a Geneva journal of the 28th that the disturbance of the Valais is regarded as effectually quelled. The Grand Council has resumed its sittings, and issued a decree for the immediate dissolution of the armed society of La Jeune Suisse, to which it attributes all the recent disasters. The members of this Society who should refuse to obey the injunctions of the Council are to be regarded as rebels.

ITALY.—Letters from Leghorn of the 23d ult. state that the arrest of two Tuscans, Messrs. Malenchini and Montecchini, at Rome, had caused the liveliest sensation throughout Tuscany. The Grand Duke was on the point of remonstrating, when he received a note from the Austrian Government, ordering him to institute inquiries and to apprehend a number of persons in Leghorn and other towns. A similar injunction had been addressed to the Duke of Lucca. Considerable agitation still prevailed in the Legations. M. Maffioli, jun., a distinguished lawyer and literary man, had been arrested at Bologna.—Letters from Naples state that the prisons of that capital are so crowded with political prisoners, that orders have been given to clear them as much as possible by sending those confined on ordinary charges at once to trial. The military commission sent into Calabria has powers to judge summarily, and to execute criminals without appeal, notwithstanding which the insurgents were still unrepressed. At Naples it is forbidden even to speak of the Calabrian disturbances.

TURKEY.—Accounts from Constantinople state that, owing to the representations of the ambassadors of the principal European powers, the Porte has of late shown a little more energy in its efforts to put down the insurrection in Albania. Both Sir S. Canning and Baron de Bourqueney have had long interviews with the Grand Vizier and Minister of Foreign Affairs upon this subject. Emir Pasha, member of the supreme Board of War, who had been sent to Albania to inquire into the situation of that province, has returned to Constantinople. His report stated that the insurrection was fast subsiding since the recent successes obtained by the imperial troops. This, however, is disbelieved, as letters have come by the same steamer as that which brought the Pasha, mentioning, amongst other atrocities committed by the Albanians, the massacre of the Hodgia Bashi and his entire family, in the village of Youdjedes, which is but a few miles distant from Salonica. Private letters from Adrianople give the same discouraging account of the condition of that district. In the neighbourhood of Tzirpan and Philipopolis the most horrible cruelties have been committed upon the defenceless Rayahs by the insurgents.—Admiral Walker is about to leave without obtaining the pension due to him. The Protestant church makes proselytes in Syria. At Trebisonde a large portion of Armenians passed to the reformed church. Their archbishop pronounced against them excessively severe penalties, which produced an effect totally opposed to his expectations.

INDIA AND CHINA.—The accounts from India and China come down to the 1st of May and 10th of March; the only thing they contain worth noticing is the murder of Soochet Singh, who had come to Lahore on the invitation of his uncle Heerah Singh, and at the earnest request of the seditious troops. He was met on his arrival by Heerah Singh, at the head of 20,000, while he had only about 500 under his command. He was instantly overpowered, and, along with other chiefs, fell covered with wounds. Ninety-five of the female portion of his household are stated to have immolated themselves on hearing of his death; and his sons have left their homes no one knows whither, but of course, for the purpose of increasing present mischief, which has caused Heerah Singh great uneasiness. Goolaub Singh, the remaining uncle of Heerah and brother of Soochet, who, according to latest accounts, was meditating a march on Lahore, in company with Kashmeira Singh and Peshord Singh, whose pretensions he seems now to have warmly espoused, is stated to be highly irritated at the death of his brother, and has demanded the delivery up of Pundit Jellar, the favourite counsellor of Heerah Singh, under whose advice he seems to have acted in this affair. The wife and children of this personage are, however, stated to be in his power, and there can be little doubt as to their probable fate, from the murdering propensities of this powerful chief. Heerah Singh appears to be in a state of the utmost trepidation from the position into which he has brought himself; and the troops within the capital were getting more insubordinate every day. The accounts from Gwalior are rather serious—an extensive conspiracy having been lately detected for the assassination of the

present Minister, Ram Rao Phalkea, who is most likely to be shortly forced to resign, from the general feeling shown towards him. From Affghanistan the intelligence is of some importance. Dost Mahomed, it appears, had not left his capital in company with his son Ukhbar, the latter alone being at Jellalabad, at the head of a large force, for which he appears to have found some occupation, having attacked the city of Bajawr, and succeded in finally reducing it, after a two days' siege. His real intentions towards Peshawur are not clearly established, though it is suspected he has intentions of no friendly nature towards the Seikhs, his brother Mahomed Aseem Khan being stated to be at Khut, south of Peshawur, with a considerable force. The accounts from Scinde still continue satisfactory, and the various buildings are rapidly in progress. The case of the mutinous portion of the Bengal force has now been disposed of—the 34th alone have been disbanded, and the rest have returned to their duty. Lord Ellenborough has postponed for a time his intended tour to the north-west, but was about taking up his residence at Allahabad. The intelligence from China comes down to March the 10th. A ship had been seized with opium on board in the port of Shanghai, and sent down to Victoria, where she was subsequently liberated on payment of a fine of 500 dollars. This seizure appears to have been brought about by a British merchant, who compelled both the Chinese authorities and the British Consul to take official notice of the opium being on board. Several chests were thrown into the sea, and others injured. This step has brought the question of the treaty and of the opium smuggling into discussion. The United States flag ship, Brandy-wine, having on board the Hon. C. Cushing, American Envoy, and suite, had arrived at Macao, and was detained there until her arrangements were completed for prosecuting her journey to the mouth of the Peiho. At all the ports business generally was represented as exceedingly dull.

UNITED STATES.—The Yorkshire packet has arrived at Liverpool from New York with accounts from that city to the 16th ult., but there are very few items of news. Philadelphia was quiet, and several arrests of ringleaders in the riots and burnings had taken place. Congress had fixed to adjourn on the 17th June, and it was probable that the Senate would concur. No further steps are reported upon the Texas question; but important news from Mexico was looked for daily, and pending its arrival, the annexation question was at rest.

Parliament.

HOUSE OF LORDS.

Friday.—After the preliminary business noticed in our last, the House proceeded with the Factory Bill. Lords BROUGHAM and FITZWILLIAM ridiculed any interference with the "rights of labour," and charged upon agricultural employments worse evils than those which resulted from manufacturing labour.—The Bishop of RIPON expressed his satisfaction on the part of the hundreds of thousands of factory children committed to his spiritual care at the limitation placed on factory labour; and he only regretted that that limitation was not carried further in the other House of Parliament.—On the 32d clause, Lord KINNAIRD moved that it be struck out. He was opposed to all interference with the labour of adults, even of females. He was supported by Lord BROUGHAM.—Their Lordships having divided, there were—For the clause, 48; for the amendment, 21: majority, 27. The clause, together with all the others in the Bill, were agreed to, and the Bill was ordered for a third reading on Monday.

Monday.—Lord KINNAIRD put a question to the Duke of Richmond—Whether his opinion on the policy of the late abolition of the wool duty had changed, since the appointment of his brother, Lord Arthur Lennox, as one of the Lords of the Treasury?—The Duke of RICHMOND said, that a more extraordinary proceeding, even on the part of the noble lord himself, was never brought forward in that House. The noble lord dealt in insinuations. He would not permit him nor any other man to deal in insinuations towards him. If the noble lord had any charge to make against him, let him make it like a man, boldly and openly. It was contrary to the proceedings of that House, contrary to the proceedings of any body of gentlemen, to make insinuations. If the noble lord thought because of an appointment under Government of a member of his family that he was to begagged in this House, let the noble lord say so. That would have been the fair, the manly, the honourable course of proceeding. He begged to say that no bargain whatever was made. He knew nothing of the appointment until his brother came to him, telling him that he had been offered an appointment in the Treasury, and to ask his advice. He told him that he had better wait with his regiment. He begged to remind their lordships that he gave up his seat in the Cabinet because he (the Duke of Richmond) could not give his consent to all the measures of the Government. With respect to the question put by the noble lord, as to the wool duties, he begged to say that when that question comes regularly before the House, he should state his opinion upon it.—The third reading of the Factory Bill afforded another occasion for LORD BROUGHAM to denounce all interference with the free contracts of factory labourers and their employers.—The Duke of SUTHERLAND, on the contrary, stated his opinion that had the hours of labour been limited to ten, instead of being extended to twelve, it would have given greater general satisfaction.—Lord WHARNCLIFFE adverted to our manufacturing greatness and civilisation. "No doubt," he said, "that much of the riches and prosperity of this country has flowed from our manufactures—but we have paid a terrible price for it. He was old enough to remember a very different state of things in the West Riding of Yorkshire, and sure he was that the country was then in a much happier state. Then there was a domestic manufacture—then there was a loom in every man's house—then every woman was at her spinning, at home, and she had time to attend to her domestic duties; nor was she so ignorant as the unfortunate women in the factories." The Bill was read a third time and passed.—The Night Poaching Bill was postponed because it had been drawn in a very slovenly manner, and had come up from the Commons in an unintelligible form.—The Earl of DALHOUSIE moved the third reading of the Customs Duties Bill.—The Duke of RICHMOND objected to the abolition of the duty on wool. He admitted that the question was one which only concerned short-wool growers; but he lived in a short-wool county himself, and he felt bound to stand up for their interests. On that ground alone he considered that it was inexpedient the Bill should pass; but he should oppose it also because it was another step in the direction of free trade, and because of the dislike he felt to free trade, inasmuch as he believed it would be the ruin of this country. If he thought he could throw out the Bill, he would divide the House against it; but knowing that he should not, in this instance, receive that support from those who always acted with him on agricultural subjects, he should not do that which he never did to any Government—namely, give it a factious opposition. The noble duke also protested against the reduction of the duty on vinegar, which would ruin many persons in the trade. The Bill was read a third time and passed.—A Bill for the reduction of Duties on Marine Insurance was read a second time.—The West India Relief Bill was read a third time and passed.

Tuesday.—The Stamp Duties (Ireland) Bill was read a third time and passed.—The LORD CHANCELLOR stated that the cause of delay in proceeding with the Bill, which he had introduced early in the session, to facilitate the transfer of freehold property, was, that he had forwarded copies of it to the most eminent conveyancers for their opinions, all of whom had not as yet given them—probably because no fees had been sent along with the Bills.—Lord CAMPBELL said that the opinion of a barrister, obtained without a fee, was worth nothing.

Thursday.—The Royal assent was given, by commission, to the Customs Duties, the Stamp Duties, the Edinburgh Burghs, the West India Colonies, the Lancaster and Carlisle Railway, the North Union Railway, the Carlisle and Maryport Railway, the Eastern Counties Railway, and two Inclosure Bills.—The Assaults (Ireland) Bill passed through committee.—The Earl of EGMONT moved the second reading of Sir T. M. Wilson's Estate Bill, the object of which was to enable him to sell part of his estate at Hampstead.—Lord DENMAN opposed the Bill on the ground that it would be a direct interference with the will of the late Baronet—that it would materially injure the property of the copyholders of the manor—and that it would deprive the public of the benefit of air and recreation which they now enjoyed on Hampstead-heath. The Noble Chief Justice said that he was supported in this view by Lord Chief Justice Tindal and other Judges, and moved that the Bill be read a second time that day six months.—Lord COLCHESTER, the Earl of WICKLOW, and Lord COTTENHAM supported, and Lord CAMPBELL, the Earl of MANSFIELD, and Lord BROUGHAM opposed it, the latter on the ground that Sir T. Wilson held his land on the terms prescribed by his father's will, and that Parliament had no right to release him from the liabilities by which the directions of his testator concluded him, or in other words to put an end to his tenancy for life.—Their Lordships then divided, and threw out the Bill by a majority of 31 to 20.

Friday.—On the order of the day for a committee on the Education of the Poor Bill being read, the Bishop of SALISBURY opposed the motion. The Bill, however, passed through committee.—At this stage of the business the King of Saxony entered the House, and took his seat opposite the Bench of Bishops, and near the Woolsack; a chair having been previously placed for his Majesty's accommodation. The House was at this time exceedingly crowded both by Peers and strangers. Lady Lurgan and her daughter were in the House. The King appeared to pay particular attention to the proceedings in the House, but he was not seen to converse with any noble lord, with the exception of exchanging a few words with the Marquis of Londonderry. Shortly after his Majesty entered the House, the LORD CHANCELLOR begged Lord Monteagle to postpone his motion for a select committee on the Import Duties, as many noble lords, in duty to her Majesty, would be necessarily absent from the House. Any day, any hour, indeed, which the noble lord mentioned in future should be granted to him. After a few words from the Duke of WELLINGTON, Lord MONTEAGLE agreed to postpone the motion till Monday.—The Marquis of LANSDOWNE and Lord BROUGHAM complained of the inconvenience of such delays.—Lord CAMPBELL said, amidst great laughter, that much of the inconvenience might be prevented were the House to meet earlier. He found that the House in ancient times met at eight in the morning.—The DUKE OF WELLINGTON would have no objection to come to the House at eight in the morning; but he thought that noble and learned Lords who had other business to attend to, and were younger than he was, would find it inconvenient to come down to the House at eight o'clock. He had no objection to Monday, or any other day, for the Noble Lord's motion.—Lord MONTEAGLE said that it would perhaps be as well to postpone his motion to Thursday next.—The Gold and Silver Wares Bill was read a third time and passed.

HOUSE OF COMMONS.

Friday.—On the order of the day for going into committee on the Ecclesiastical Courts Bill, Mr. DUNCOMBE brought forward his motion for the abolition of all Ecclesiastical Courts. On a division the motion was negatived by 115 to 70.—Mr. BORTHWICK moved that the Bill be committed that day six months. This was negatived by 62 to 25, and the House went into committee. Several amendments in opposition to the leading principles of the Bill were then moved, and after seven divisions on different points, the chairman reported progress, without having passed a single clause.

Monday.—Mr. ENTWISLE took his seat for South Lancashire.—The House having resolved itself into a committee on ways and means, the CHANCELLOR of the EXCHEQUER rose to state the nature of the resolutions proposed by the Government with respect to the sugar duties. Standing on the great anti-slavery principle, yet looking to the necessity of enlarging the supply of sugar for the people of this country, he thought both could be reconciled, consistently with due regard to the interests of our sugar-growing colonies, and of those the entire of whose property was invested in them. Sugar, once only a luxury, had now become all but a necessary of life; and there would be no difference of opinion as to the importance of maintaining such a supply as would keep it at a fair price. In earlier times, our colonies not only supplied sufficient for all our wants, but also enabled us to export; but when the great act of Emancipation gave rise to fears that the change from slavery to freedom would cause a diminution in production, Parliament interfered, and by equalising the duties on East and West India sugars enlarged the field of supply. The increase of the population had rendered this additional supply insufficient; it was necessary to increase facilities for obtaining an increased amount of free labour sugar, and our new commercial relations with China rendered it a matter of importance to enlarge our trade with that great country, as well as with other countries, where it was produced by free labour. The question of admitting free labour sugar was not raised for the first time; but when formerly discussed, peculiar circumstances forbade the adoption of the proposition. Java, the Manillas, and China, are the chief quarters from which a supply is at present expected, though our information with respect to the produce in China is still very incomplete. The check to be maintained at the Custom-house against the fraudulent substitution of slave-grown for free-grown sugar is to be the same as that which was effective in the case of coffee, namely, certificates of origin, one of which is to be given by the British Consul at the port of shipment. The differential duty of 10*s.* to be maintained was not greater than our colonial interests required. Mr. Ewart proposed to equalise the duty on all sugars imported; that could not be assented to. Again, Mr. Philip Miles had an amendment in order to reduce the duty on colonial sugar to 23*s.*, thereby increasing the differential duty. He well knew the difficulties with which the West India interest had to contend; but he thought that the Government proposition would afford them adequate protection, and though they might not at present approve of it, they would find that it will insure their ultimate prosperity. If the price of sugar were to rise in this country to what it was in 1840, that, however temporarily beneficial, would be really far more injurious to the West Indian colonies than anything they had to fear from the competition of free labour sugar. Then, again, Lord J. Russell proposed to equalise the duty on all foreign sugar, whether raised by free or slave labour. This was the old battle-ground on which the contest had taken place in 1841, and decided against him; and he apprehended that the people of this country were not yet prepared to overthrow what had cost so much blood and treasure to effect, namely, to reverse the emancipation policy, and to abandon our colonies, which could not withstand the competition of the sugar of Cuba and the Brazils—finer in quality, cheaply raised, and which would lead to the perpetuation of the slave-trade. It was urged that we had treaties, according the privileges of "the most favoured nations," with countries, under which we would be compelled to admit slave-grown produce, if this measure were passed. The only countries with which we had such treaties were the United States, Sweden, Mexico, Buenos Ayres, and some of the other South American republics. Sweden possessed only one sugar-growing colony, and its produce, small in amount, went direct to the mother country. The United States imported a large quantity of sugar for their own consumption from other countries, and the price of sugar was higher at New York that at Liverpool or London. It was said that the Americans would lay on a bounty on the importation of sugar of from 11*s.* to 15*s.*, in order to be enabled to send it to this country. But in the present state of feeling in the United States it was not likely that such a proposition would be adopted by Congress; and it was not at all probable that the Americans, who, whatever were their faults, were not insensible to their own interests, would withdraw sugar from the higher markets to their own country, to send it to this, where it would fetch a lower price. He proposed—1. That, towards raising the supply granted to Her Majesty, the several duties now payable on sugar be further continued for a time to be limited, save and except that from and after the 10th day of November next, there shall be charged on brown, muscovado, or clayed sugar, certified to be the growth of China, Java, or Manilla, or of any other foreign country the sugar of which Her Majesty in council shall have declared to be admissible, as not being the produce of slave-labour: the cwt. 1*l.* 14*s.*, together with an additional duty of 5*l.* per centum on the aforementioned rate. 2. That, from and after the 10th day of November next, Her Majesty be authorised, by order in council, to give effect to the provisions of any treaty now in force, which binds Her Majesty to admit sugar, the produce of a foreign country, at the same duties as are imposed on sugar the produce of the most favoured nation.—Lord J. RUSSELL remarked that the Chancellor of the Exchequer was retreating from the ground he once occupied, and was abandoning weapons he formerly wielded with so much effect. The rising price of sugar was now put forth as the reason for enlarging the amount of supply; but neither the present price nor the amount of supply differed very materially from what they were in 1841, when the then proposition of the late Government was rejected. What he objected to was, that they did not make their proposition a straightforward measure, in accordance with the sound principles of trade. They were adopting a new principle in commerce; making grounds of morality the guide of trade; erecting a pulpit in your Custom-house; and turning landing-waiters into preachers of anti-slavery doctrines. Commerce was best set free from all such inquisition. Christianity and civilisation would be sooner and better diffused by freedom of intercourse; for, by adopting this new moral principle as the guide of our commerce, we offended every country against whom we declared; the Brazils and Spain were thereby tempted to retaliate, and to shut out our manufactures, as we did their produce. We legislated for Java, yet in Java they were told that labour was compulsory, and the condition of the peasantry was very low indeed. What was the state of our trade with Cuba and the Brazils? We sent them the manufactures of Yorkshire and Lancashire; and in so doing, encouraged slavery as much as if we took their slave-grown produce. From Russia we got tallow and hemp, articles to us essential, and which we could not well procure elsewhere. Pass this measure, and our merchants will have additional inducements to send Brazilian sugar to Russia, and in return for it to import Russian tallow and hemp. We would thus enable the Russians to eat the sugar which we considered it an abomination to touch. The pretence of discouraging slavery was a flimsy veil; for the 90,000 tons of free-labour sugar which was proposed to be admitted would only be withdrawn from the general market of the world, and the vacuum be filled up by slave-grown produce. It was a matter of astonishment that the Government of this great commercial country should deal with such a question in such a way. There were 50,000 tons of sugar produced in the United States; of that quantity 40,000 were sent to New York, and our merchants, importing cotton, would soon discover that they could also bring over the sugar as cheaply as it was now carried to the northern American ports. The great falling off of consumption in sugar was a sufficient reason for reconsidering these duties; since the commencement of the century, the consumption of tea and coffee had trebled, while that of sugar was all but stationary. Do not, for the sake of bolstering up the consistency of the members of your Cabinet, act contrary to all commercial principles. But he was opposed, however, to the equalisation of the duties on *all* sugars; the great event of Emancipation had altered the mere commercial aspect of the question, and justified the expediency of a discriminating duty, as between foreign and colonial. The West Indians would find out that the distinction between free-grown and slave-grown sugar was wholly delusive; the 90,000 tons of free-grown would be augmented by tons of smuggled slave-grown; and for this we will have thrown away the good-will of the Brazils and other countries. Let them take the principle of free trade as their rule, the straight line, as Lord Grenville defined it, to which we should approach as closely as we can. The true principle was not to attempt to regulate by legislation as to where and what people should buy and sell. Prizes were offered by the Protection Society for the best essays on the benefits of protection; they should go a step farther, and offer a prize for the best refutation of the works of Adam Smith. Lord Shelburne, as far back as 1783, more than sixty years ago, had eloquently expounded the doctrine of free trade, which the position, the capital, and the industry of England rendered it, as he expressed it, best for us to establish. He was afraid we had made but little progress since Lord Shelburne's time. We should now set the example; for, with what face can we lecture other nations, as Lord Aberdeen has done the Prussian Government, when we shut out the corn and the timber of the northern countries of Europe? By now acting on sound principle we might unite in one all the nations of the world. The noble Lord concluded by proposing an amendment, that the duty of 34*s.* should admit all foreign sugars, whether free or slave-grown.—Mr. GLADSTONE denied that the Government had abandoned the ground taken up in 1841, for the objection then taken was, that the proposition of the late Government was hasty and premature. If the question had been merely one of commercial monopoly it would have been conceded then. In 1840 Mr. Labouchere had admitted that it ought not to be approached on commercial principles alone. They were taunted with erecting a pulpit in the long-room of the Custom House. Why, the Whig Government in detaching cruisers to guard the coast of Africa in order to put down the slave traffic, had converted Captains of ships of war into preachers of morality. As to Java, they had no detailed information, but they had enough to decide that the sugar raised there was strictly that of free labour. The rent was paid in produce; but no man was compelled to hold land, and therefore cultivation was no more compulsory than that of a farmer in this country holding under a lease. There was a certain kind of expiring domestic slavery, but there was no adscription to the soil. Siam was not included in the resolutions, because they had not information on which they could satisfactorily assure Parliament that sugar was not there raised by slavery. There was a jealousy of foreigners; and the Monarch of Siam was himself the great sugar-broker or merchant of the country. That country was therefore reserved for future consideration. From China they had no reason to expect a large supply. But though 90,000 tons were calculated on as produced by free labour, it would not all come to this country. A large portion

of the Java sugar, which was paid as rent, went direct to Holland, and could not, under our navigation laws, be introduced here. The argument that Brazilian sugar would go to Russia, for which we would get hemp and tallow, was one of those cases which we could not help nor prevent. Show him a remedy, and he would adopt it. Tobacco, cotton, and coffee, were not the great props of the slave-trade; it was sugar, as shown by St. Domingo, where the cultivation of sugar died with slavery, but coffee continued to be successfully cultivated. The slave-trade consisted in the traffic in adults, and this was the evil. When it was urged that free-labour sugar imported here would only create a vacuum in the markets of the world for slave-grown produce, it must be recollected that the same argument was urged against Emancipation; it was said that we would diminish our own produce by setting our slaves free, and the deficiency would have to be made up by slave-grown produce from other countries. But it was then replied, Let us relieve ourselves from the guilt of slavery, and other nations would imitate our example. In Brazil, for example, our policy had told; the cultivation of sugar had been successfully discouraged, from the shutting of our market. After going considerably into detail, in reply to various arguments, he admitted that this was a severe measure towards the West Indies, but that it must also be recollected that they were laying a tax on the British consumer of 10*s.* 6*d.* on foreign free sugar for the benefit of the West Indies, while slave-grown was excluded altogether. They were thus laying a tax of 50 per cent. on the value of an essential article, a measure to which he would not be a party if they had merely to deal with these duties alone, without reference to other considerations. He regretted that they should be taxed with the base vice of hypocrisy; credit might be given them for maintaining their anti-slavery professions, and bringing in a measure which would combine the greatest of practical good with the smallest amount of injury.—Mr. LABOUCHERE, Mr. P. M. STEWART, Mr. HUME, and Mr. T. BARING joined in the debate, the first exposing the impolicy, unsoundness, and mischievousness of the proposed change; the second pleading the case of the West India interest; the third deploring the conduct of the Government; and the fourth undertaking its defence, though thinking that the measure was ill-timed, in the state of existing interests.—Dr. BOWRING, Sir J. HANMER, and Mr. EWART added some remarks, and on a division there appeared—For the resolutions, 197, against them, 128; majority, 69. The resolutions were then agreed to.

Tuesday.—In reply to Mr. T. Duncombe, Sir J. GRAHAM stated that, having received information from the Governor of Guernsey that considerable excitement, arising from local differences, existed in that island, the Government had sent over a temporary reinforcement of troops. But these differences were now under judicial investigation, and the Government placed the most implicit reliance on the loyalty of the people of Guernsey.—On the motion of Mr. T. DUNCOMBE, a copy of the judgment and commitment in the case of O'Connell and others was ordered.—Lord J. RUSSELL postponed, for a fortnight, his motion for a copy of despatches from the Earl of Aberdeen to the Earl of Westmoreland, with respect to commercial relations between this country and Prussia, with any answer to such despatch from the Court of Prussia. The noble Lord did so on the statement made by Mr. Gladstone that, subsequent to the despatch dated the 19th of March, received from Baron Bulow, communications had been received which were conceived in a different spirit, and which tended to different results; and that the correspondence was still going on.—Lord H. VANE moved that the House should resolve itself into a committee to take into consideration so much of the Act of 5th and 6th Victoria, c. 47, as relates to the export duty on coal, with the view to its immediate repeal. The noble Lord urged that this duty involved no great question of revenue; that it was to all intents a new tax, causing a greater displacement of labour and capital than the old duty, and that it inflicted severe loss to mining labour, and exercised most injurious influence on the shipping interest.—The CHANCELLOR of the EXCHEQUER contended that the export trade in coal, instead of having diminished since the alteration of the duties, had in fact increased. As to the alleged depression of the coal-shipping interest, he answered that there had been a general lowering of freights in all branches of trade, and therefore the coal trade had come in for its share and no more. He opposed the motion. After a discussion, in which Mr. GRANGER, Mr. WARBURTON, Mr. H. HINDE, Mr. HUME, Mr. BARING, Mr. LIDDELL, Mr. DUNCOMBE, Lord HOWICK, Alderman HUMPHERY, Mr. HUTT, and Mr. WALLACE took part, the House divided—For the motion, 74; against it, 110; majority, 36.—Mr. LYALL moved for the appointment of a select committee to inquire into the state and condition of the commercial marine of this country, and to take into consideration and report on the best mode of encouraging and extending the employment of British shipping.—Mr. GLADSTONE assented to the motion, on the distinct understanding that it should not, in the slightest degree, be taken as implying any intention on the part of the Government to disturb our reciprocity treaties with other countries. The motion was agreed to.—Mr. HUME brought forward a case of alleged grievance arising out of the conviction and imprisonment of one Alfred Moore, a hawker, at Shrewsbury.—Mr. D'ISRAELI answered the case by some amusing sarcasms on Mr. Hume's misstatement and misunderstanding of the case.—Mr. HUME replied, persisting in his own view, and calling on Sir J. Graham to state what had come to his knowledge respecting the case.—Sir J. GRAHAM gave an explanation, corroborating what Mr. D'Israeli had stated, that the man was found to have obtained money on false pretences, and for that offence was convicted as a rogue and vagabond.—A good deal of conversation followed, several gentlemen taking technical objections, and imputing oppression and hardship, while Sir J. Graham demurred to their attempt at trying the question by way of appeal. The discussion then ended.—Sir J. GRAHAM postponed his Bills relating to the profession of physic and surgery throughout the United Kingdom.—On the motion of Sir R. INGLIS, a select committee was appointed to inquire into the state of Westminster Bridge, and into the expediency of repairing the old or erecting a new one.—The CHANCELLOR of the EXCHEQUER announced that the Sugar Duties would be proceeded with on Monday next, instead of the Bank Charter Bill, which he postponed to Thursday week.

Wednesday.—The main business this evening was the presentation of a great number of petitions for and against the Dissenters' Chapels Bill, and a discussion on the Commons Inclosure Bill.—Lord WORSLEY proposed that his Bill should be committed *pro formâ* with a view to alterations by the Government, and another day be fixed for proceeding with it. After some discussion on the principle of the Bill this course was adopted, and the Bill was accordingly committed *pro formâ*, with a view to improvement and subsequent procedure.

Thursday.—Various questions were asked as to the days fixed when important measures are to be discussed; and in reply to Lord J. RUSSELL, Sir R. PEEL said that he would give such ample notice of the day when the Irish Registration Bill will be taken, as will enable every person in her Majesty's dominions to attend the debate, if inclined to do so. The first order of the day was the second reading of the Dissenters' Chapel Bill, for a bill against which a great mass of petitions were presented.—The ATTORNEY-GENERAL then stated the nature and objects of the Bill at considerable length. The enactments of the measure, he said, neither affected the property of the church of England nor of the Wesleyan bodies, but their operation was confined simply to Dissenting chapels. He did not think that it would encourage Unitarianism; but, even if it did, the present was not the time to oppose a toleration that was granted by the Acts of 1813 and 1819. The Bill was not intended by its powers to affect any case in which there was an express provision as to the particular sect for which the charity was designed. It was solely intended to allow congregations being in possession twenty-five years, and where no express intention of the original founder existed, to remain undisturbed in their possession, and to free them from the litigation which had been engendered by recent judicial decisions.—Sir R. INGLIS gave due credit to the Government for their disinterestedness in persevering with a Bill which was likely to offend many of their usual supporters, and which was intended to benefit exclusively those who had ever been their opponents. He was prepared to admit that after Parliament had relaxed the penal laws, and in 1813 had given a complete legal existence to Unitarians and all other classes of Dissenters, it ought to have followed from that that their foundations, which were before illegal, should have received the sanction of law; and if the Bill had been limited to that clause he probably should not have objected to it; but beyond that point of concession he could not go, and the second and third clauses were so very objectionable that he should endeavour to induce the House to reject the Bill altogether. The Hon. Baronet moved the second reading that day six months.—Mr. PLUMTRE, believing that the measure was looked upon in no other light than an insult to the Christian feeling of the country, and fully agreeing that such was its character, felt the greatest satisfaction in seconding the amendment.—Mr. MACAULAY supported the Bill and expressed his astonishment that Presbyterians, who were even now petitioning the House to legalise marriages which the Judges had felt bound to declare illegal, should petition against a Bill to legalise the occupation of property for the benefit of another sect of Dissenters.—Mr. COLQUHOUN opposed, Mr. BERNAL and Mr. M. MILNES supported the Bill.—Mr. FOX MAULE opposed it. He said the Bill when first introduced was not so malignant in its character as at present. It was not till it was about to be read the third time that its most unjust clauses were inserted. When first introduced it did not even extend its provisions to Ireland. He had heard, on good authority, that in August last the Lord Chancellor had pledged himself to a deputation of the Synod of Ulster, and other Irish Presbyterians, that the Bill should not extend to Ireland until that body had an opportunity of being heard by counsel against it at the bar of the House. That pledge had been violated.—Mr. GLADSTONE insisted that, though the original founders of the meeting-houses in question had been, in the vast majority of instances, persons of Trinitarian opinions, yet, on the principles of justice, the present occupiers, being Unitarians, ought to be protected in their holdings.—Mr. SHEIL and Lord JOHN RUSSELL bestowed the highest commendations on Government for their perseverance in this measure, notwithstanding the opposition expressed against it by the Church, and the great portion of the Presbyterian body.—Sir R. PEEL said he had undertaken to give his support to the Bill at a time when he had good reason to doubt its success in Parliament; but he entertained so strong an opinion, and so firm a belief, of the justice of the principles on which it was founded, that he and his colleagues were determined to make all other considerations subordinate to their duty of carrying it into a law. He congratulated himself in having the weight of argument, and the great preponderance of votes, in that House with him on this question.—Lord SANDON supported the Bill. The House having divided, there were—For the second reading, 307; for the amendment, 117; Majority, 190. The Bill was read a second time, amidst loud cheers. The Forestalling Bill, and the New South Wales Bill were read a third time and passed. The Vinegar and Glass Duties Bill passed through committee.

Friday.—The Ashton, Stalybridge, and Liverpool Junction Railway Bill, after several clauses had been added by way of rider, was read a third time and passed. The Edinburgh, Leith, and Granton Railway Bill, and the Sheffield, Ashton under-Lyne, and Manchester Railway Bill were also read a third time and passed.—The order of the day having been read for going into committee on the Parishes (Scotland) Bill, the LORD ADVOCATE explained the nature and object of the measure, and referred to the course of legislation adopted on former occasions in relation to this subject, and concluded by moving that the house go into committee on the Bill.—Mr. F. MAULE objected strongly to the Bill. He considered it quite unnecessary, and moved, as an amendment, that it be committed this day six months.—Mr. P. STEWART opposed the Bill. It was, in fact, merely a measure of church extension in Scotland, which was not required in that country, where lately there had been so many seceders from the Establishment. (While the hon. member was speaking the King of Saxony entered the House. His Majesty occupied the seat of the Sergeant-at-Arms, and appeared to pay great attention to the proceedings. Soon after the King had taken his seat, Sir R. Peel went up to his Majesty, and entered into conversation with him. No interruption, however, took place in the proceedings of the House, and the debate went on as though his Majesty had not been present.)—Mr. HUME, Mr. E. ELLICE, and Mr. WALLACE, supported the amendment.—Sir J. GRAHAM was surprised that hon. gentlemen could say that the Bill was brought in with objects which had not been avowed. Those who said so ought at least to give their grounds for that statement. The principle of the measure was not Erastian—it was a principle which had been always upheld in the best times of the Scotch Church. (Left sitting.)

CITY.

Money Market, Friday.—Consols closed at 98⅜. Red. Three per Cents. 98⅞. Three-and-half per Cents. Red. 101⅞. Bank Stock, 199. Exchequer Bills, 71 to 73, premium.

GAZETTE OF THE WEEK.—BANKRUPTS.—T. STEPHENS, 66, Newgate-street, and 5, Holborn Bars, City, umbrella manufacturer—J. CLARK, Abington, Cambridgeshire, draper—R. COLEMAN, and E. R. HALL, Colchester, Essex, ironfounders—C. ALDERTON, Brighthelmstone, tailor—W. LINE, now or late of Ramsgate, Kent, builder—E. SEDGWICK, Hythe, Kent, scrivener—W. H. BATES, Birmingham, factor—J. SMITH, Warwick, wine merchant—B. NORMAN and E. BUCKMAN, Cheltenham, Gloucester, ironmongers—L. JONES, Barmouth, Merionethshire, corn dealer—J. BATTEN, North-street, Tilehurst, Berkshire, cattle and sheep-dealer—J. LEVET, Soham, Cambridgeshire, carpenter and builder—J. YOUNG, Aldermanbury, lacemen—W. BARNES, Ludgate-hill, bonnet-maker—G. FIELDING, Thame, Oxfordshire, ironmonger—J. B. W. KNIGHT, St. James's walk, Clerkenwell, printer—W. TURNER, Manchester, cabinet-maker—J. L. SMITH, Leicester, cabinet-maker—G. JENKINSON, Woolverhampton, butcher—J. PARKER, Kingston-upon-Hull, corn-miller—S. H. SPENCE, Leeds, Yorkshire, maltster.

SCOTCH SEQUESTRATIONS.—A. C. WATT, Aberdeen, merchant—D. KAY, Edinburgh, baker—G. RITCHIE, Edinburgh and Perth, writer to the signet.

Metropolis and its Vicinity.

The Polish Ball.—Considerable speculation has been current during the week on the subject of the Polish Ball, and much angry discussion is understood to have taken place among the ladies patronesses in reference to the propriety of not holding the ball while the Emperor of Russia is in this country. All doubt is now set at rest by the announcement that the ball will positively take place on Monday next, the 10th inst. At a very full committee of lady patronesses, which met on Wednesday afternoon, at Willis's Rooms, the Marchioness of Ailesbury in the chair, it was stated that there was nothing whatever to interfere with the ball on that day, and that the prospects of its success were most brilliant. Three times as many tickets have already been sold as were disposed of at a corresponding period last year, and every arrangement has been made to prevent confusion in consequence of the large number expected to attend.

The Pitt Dinner.—The triennial commemoration of the birth of William Pitt was celebrated by the members of the Pitt Club on Saturday, at Merchant-Tailors' Hall. Lord Feversham was in the chair, and among the company, which numbered about 120, were the Earl of Eldon, the Earl of Dartmouth, Lord Kenyon, and several members of Parliament.

British and Foreign Anti-Slavery Society.—A special meeting of members of this Society was held on Monday at Exeter-hall, for the purpose of considering that part of the constitutions of the Society which pledges its adoption of fiscal regulations in favour of free labour. The meeting was rather a small one, and consisted by fully one-half of members of the Society of Friends. Mr. Tuke, of York, presided. Mr. Bright, M.P., asked whether this meeting was to be understood to represent the whole Anti-Slavery body of this country, or only the opinions of the members or individuals now present?—The Secretary explained, that after the last meeting, it having been determined to hold this special meeting, a circular had been sent to those persons who continued to be subscribing members; and that the circulars so sent were to be taken to be tickets of admission to the meeting. Had they been sent generally to the anti-slavery "public," the meeting could not have been a deliberative assembly. After some discussion on this point, some long documents were read explanatory of the views of the society on the "fiscal" part of the question, and several gentlemen present addressed the meeting. Mr. Hinton moved "That in the judgment of this meeting, that portion of the fourth rule of the society, which requires it 'to promote the adoption of fiscal regulations in favour of free labour' ought to be confirmed." Mr. J. J. Gurney seconded the resolution. Mr. Smith, of Sheffield, moved as an amendment that the clause in question be annulled. Mr. Bright, M.P., seconded the amendment. A long discussion arose upon the proposition of adjourning the meeting until four o'clock, which was supported by Mr. G. Thompson, Mr. Bright, and the majority of the meeting, and eventually carried. The meeting resumed at half-past three o'clock, although it was understood to have been adjourned for an hour from three o'clock. Another discussion followed, when the Chairman put the amendment, when only seven hands were held up in its favour. He next put the original motion, in favour of which 82 voted, when the Chairman declared the original motion to be carried.

The Statue of Lord Byron.—The *Morning Chronicle* states that a case of an extraordinary nature, and in which the names of two of the greatest characters of the age will figure, is about to be brought before the London tribunals. Thorwaldsen, it is well known, had executed a colossal statue of Lord Byron, which he considered as one of his best works, and presented it to the Chapter of Westminster, on condition of its being placed in this cathedral, beside the monuments of other poets. The Chapter at first accepted the offer; but, it is equally well known, that some scruples were raised afterwards against placing the author of "Don Juan" in this national mausoleum; and the case containing the precious marble was never claimed by the Chapter. The testamentary executor of Thorwaldsen being informed of this state of things, made some inquiries, and the masterpiece of Thorwaldsen was found lying on the floor of a cellar in a state of extreme deterioration, amongst the fragments of the case, which the humidity of the place had reduced to a state of perfect rottenness. Consequently, a person duly authorised by the executor, addressed a formal reclamation to the authorities, but when the Custom-house officers went with him to the cellar, it was found that the statue had disappeared, and nothing but fragments of the case remained behind. The executors then addressed to the Custom-house a demand for indemnity. This, however, was refused under the plea that it cannot be answerable for goods refused by the parties to whom they are addressed, and that such goods remain in their stores solely at the expense and risk of those to whom they belong. At this stage, in fine, the executors have resolved on bringing an action for damages against the Custom-house. The sum claimed is 30,000*l.* (750,000f.) at which the statue was valued by the artists of Rome on its being shipped to London.

Metropolis Churches Fund.—On Sunday morning a letter addressed by the Lord Bishop of London to the clergy of his diocese, was read in every church and chapel throughout London, and those parts of the suburbs under the jurisdiction of his Lordship, on the subject of an appeal to their respective congregations in behalf of the erection and endowment of additional churches in the metropolis. In the course of his letter the Bishop remarked that eight years had elapsed since he put forth proposals for raising a fund to be applied to the building and endowment of new churches. The subscriptions which had been received for general objects, amounted to no less a sum than 158,173*l.* A separate fund was afterwards formed for the erection and endowment of 10 additional churches, with parsonage-houses and schools, in the single parish of Bethnal-green, containing more than 70,000 inhabitants. To this fund the contributions amounted to 59,694*l.*, so that altogether a sum of 217,867*l.* had been subscribed. This supply, however, was inadequate, as there were still 213,000 souls wholly unprovided for. His Lordship's letter concluded with a request, that on Sunday the 9th (to-morrow), a collection be made in every church and chapel within his diocese, for the purpose of providing a fund for the erection of additional churches.

The New Sheriffs.—Aldermen W. Hunter and Challis.

will be put in nomination for sheriffs for the year ensuing at Guildhall on Midsummer-day next. A rumour is afloat that the Livery will adopt some strong resolutions respecting the conduct of Alderman Gibbs.

Anti-Corn-Law League.—The weekly meeting of the League took place on Wednesday in Covent-Garden Theatre, Mr. G. Wilson in the chair. The meeting was addressed by the chairman, the Hon. E. P. Bouverie, M.P., Mr. M. Gibson, M.P., and Mr. Moore. The meeting then adjourned for a fortnight, the theatre being engaged for the Conservative dinner on Wednesday next.

The Will Forgeries.—The convicts Barber and Fletcher are still at the Penitentiary. Barber is a tailor, and was seen in the course of last week making breeches, dressed in the convict's apparel, and with his head closely cropped. Having chosen this trade, he is, as a matter of course, excused from the more disagreeable occupation of picking oakum, which is extremely laborious, and taxes the eyes as well as fingers. Fletcher, whose profession as a medical man is not likely to be called into exercise, and who cannot use the needle or wax-end, is regularly seated along with the other convicts, and kept at work with the oakum. They are both in good health.

The Sanatorium.—The anniversary festival, in aid of the funds of this institution, was celebrated on Tuesday at the London Tavern. About 190 ladies and gentlemen sat down to dinner, it being one of those rare occasions in which the former are permitted to descend from the gallery, and partake with the gentlemen of the luxuries which are spread before them. Mr. Charles Dickens took the chair, supported by Mr. Porter, of the Board of Trade; Mr. Stanfield, R.A.; Mr. Maclise, R.A.; Mr. Harrison Ainsworth, Mr. Harley, and other gentlemen. The subscriptions amounted to upwards of 400*l.*

Departure of the Governor-General of India.—Sir Henry Hardinge, the newly appointed Governor-General of India, took leave of Sir R. Peel and his late colleagues yesterday, and will leave town this morning for Marseilles, where a steamer is waiting to convey him to Egypt. His Excellency will embark at Suez on board the Hindostan steamer for Calcutta. His luggage and carriages were sent down by railway to Southampton, and shipped on board the Great Liverpool steamer, which took out the India mails of the 3d inst.

Dinner to Mr. Charles Knight.—A public dinner was given on Wednesday evening at the Albion tavern, to Mr. Charles Knight, the well-known publisher. The dinner was given by a large circle of Mr. Knight's friends on the occasion of the completion of the "Penny Cyclopædia." Upwards of 150 gentlemen were present. The chair was taken by Lord Brougham, who was supported by Lord Wrottesley and several contributors to the periodicals of the day and other literary productions.

Sale of Guano.—Several sales of guano have taken place during the last fortnight in Mark Lane. The cargoes were all brought from the island of Ichaboe, on the coast of Africa. The first, by the Maid of Athens, consisted of about 286 tons, and realised prices varying from 10*l.* 7*s.* 6*d.* per ton. The second by the Angra Pequena, consisted of 160 tons, and realised from 10*l.* to 10*l.* 12*s.* 6*d.* per ton. The third is at present on board a vessel in the Downs, and consists of about 450 tons, being the largest importation in one vessel, from Ichaboe. The analysis was stated to be about as follows:—Volatile ammoniacal salt, consisting of phosphate, oxalate, carbonate, and humate of ammonia (containing 7½ per cent, of free ammonia), 26 per cent., organic animal matter 8, together 34 per cent., fixed alkaline salt principally phosphate, muriate, and sulphate of potash, 11 per cent; phosphate of lime and magnesia, and oxalate of lime, 30 per cent; with only half per cent. of sand, and of moisture 24·50 per cent. There were 60 lots of 5 and 10 tons each, the average prices of which were 9*l.* 7*s.* 6*d.* per ton. The whole cargo was disposed of for about 4230*l.*, which, as the only expenses were freight, insurance, the pay and support of the crew during the voyage, would leave very large profits to the owners.

The Ancient City Wells.—In the course of last week, while making excavations in Friday-street, Cheapside (where formerly stood the Saracen's Head Inn, and the house of Sir C. Wren), a deep well, said to be of Roman construction, was discovered. It was about two feet below what was supposed to be the ground on which the Saracen's Head was erected, but upon digging the earth massive walls were met with, of the Roman and subsequent periods. The Roman wall was composed of Kentish flags, flint, and cement. Other walls, which were made of bricks, were so firmly cemented together that the pickaxes were blunted, and it required wedges to be used in order to separate the bricks from each other. The well, on being plumbed, was found to be about 40 feet in depth, and the water was pure and pellucid. It was not known to the late occupier of the inn that such a well was in existence. A short time ago, in Addle-street, a similar description of well was found upon clearing away the earth for a foundation. It is supposed that after the fire of London many wells were lost, which were covered over with the bricks and rubbish of the houses destroyed, as in several other parts of the City wells have been found on removing the earth.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending May 25.—West Districts, 132; Northern, 179; Central, 136; Eastern, 191; Southern, 228; Total, 876. Weekly average for the last five years, 946.

Provincial News.

Bedford.—A man named James Richards was examined last week before a bench of magistrates, at Luton, on a charge of being concerned in stealing, in September last, a banker's parcel, containing 1700*l.*, from the Bedford coach. Several 5*l.* notes have been traced to the possession of the prisoner, and he was remanded at the request of his own legal advisers.

Bradford.—On Whit Monday a procession of the Orange lodges of Bradford and the neighbourhood took place, at which a band of music was hired to play the "Boyne Water," and other party tunes. The procession passed off quietly, but as the band were returning home in the evening, carrying their instruments packed up, they were attacked by a mob of Irish Catholics, who knocked them down, killed one of the band, and destroyed their instruments. Several Irishmen are in custody for being concerned in this outrage.

Carlisle.—The inhabitants of the barony of Gilsland, and of the district surrounding Naworth Castle, presented an address to Lord Morpeth last week, expressing their sympathy and regret at the destruction of the ancient border-residence of his ancestors. Lord Morpeth, in his reply, said—"I do not affect to treat lightly the loss which my family, and in some degree the public, have sustained. There were features and lineaments belonging to the ancient dwelling-house—the border stronghold, which gave to Naworth an aspect and a character peculiarly its own. It is true, you would vainly have sought there the space and the state which are to be met with in the present arrangements of the castles of Alnwick, Warwick, or Windsor; but there, as nowhere else, you could look upon the actual halls where old Barons and Wardens presided, and galleries where retainers kept watch for moss-troopers,—upon vaults where the booty of the foray was stored,—upon dungeons where free-booters, if not Scotchmen, were immured. But while much has undoubtedly been lost which must be mourned over as irreparable, there is still much room, as you properly remind me in your address, for gratitude in what still remains. The entire tower of, whether you call him 'Bauld' or 'Belted' Will—the whole circlet of the outer walls, both within and without the court, in their full massiveness and their gray simplicity—the very verdure which clothes them in all its freshness—and the ineffable beauties of the site, these are all still left to us." It is said that Lord Carlisle intends to rebuild the castle immediately.

Chatham.—A Court-Martial was held in this garrison last week, on Serjeant-Major Neelance, of the 12th Lancers, for having offered a bribe to his commanding-officer to report favourably of him as a riding-master. He was found guilty and sentenced to be reduced to the ranks. At the announcement of the sentence he became so excited, that when the stripes were removed from his coat, he threw it upon the ground, and said he would never put it on again. Since that time, the unfortunate man has become a confirmed lunatic.

Gravesend.—About 10 o'clock on Sunday night a fire broke out in a lane off West-street, Gravesend, and in a few minutes seized upon the adjacent house, and spread from that with inconceivable rapidity to the adjoining coal wharf, belonging to the Commercial Coal Company, where it raged with vehemence, the coal having ignited and sent forth a flame which spread to the adjoining streets. In less than an hour the whole of the area, including the Commercial Coal Wharf, the Star Packet Wharf, Messrs. Elkin and Co.'s Coal Wharf, the block, rope, and sail warehouse, the Cock, the Shipwright's Arms, and the Fishermen's Arms public houses, and the whole of the premises in a back lane, almost altogether inhabited by fishermen and watermen, and comprising 12 or 14 houses, in many of which were four and five families, were enveloped in flames. These houses were constructed of wood, and the materials on the burning premises being of the most combustible kind—coals, ropes, hemp, tar, spirits, oil, paint, and a quantity of gunpowder, the fire of course raged with the utmost fury. The town fire-engine was brought down but without the hose. Some delay occurred in sending for the hose, and when it arrived it would not fit. The authorities did not know the exact position of the water-plugs, but at length water was brought in buckets, when it was discovered that the engine was out of order. The inhabitants of all the streets adjoining the scene of destruction were at this time in a state of bewilderment, no less astounding than that of the town functionaries. All, however, were aroused at length to activity by the instinct of self-preservation, and concluding that the town would be consumed (a conclusion not extravagant, as the wind from off the water bore the flames and the burning embers into the very heart of the town), they commenced removing the household furniture out of the reach of the apprehended conflagration, and a scene of confusion followed which can scarcely be conceived. The furniture and valuables only escaped the fire to be whipped away by the thieves, who congregated from all directions, and who even entered the shops and public-houses in the neighbourhood of the conflagration, and seized all they could lay hands on, until the arrival of the military put some check on their movements. The troops crossed from Tilbury Fort, and three engines arrived from Chatham, Rochester, and Dartford, and by their united efforts the fire was extinguished by pulling down several houses in the line of its course. Altogether 28 houses were destroyed, most of them uninsured. Fortunately there was no loss of life. When the fire was at its highest pitch, the scene from the opposite shore was awfully brilliant, and some idea may be formed of the reflection it produced in London, when it was seen from the metropolitan bridges, and several brigade engines were called out, but the locality of the fire not being known, and it evidently appearing some distance from town, they returned. No such calamity has occurred in Gravesend since 1774, when 200 houses were burned down.

Lancaster.—On Tuesday, the 28th ult., an extensive conflagration took place on the turf moss, near Yealand Redmayne. To put a stop to the fire was impossible, though every means were used to check its progress. Immediately a large number of persons were on the ground, each one endeavouring to preserve his own property. On Wednesday the fire raged with redoubled fury, and was still raging on Thursday evening. Similar conflagrations have taken place at Fowlshaw, Winmarley, and Brigsteer Mosses. At the Winmarley Moss, a correspondent informs us that about 8 acres of newly sown corn were destroyed.

Louth.—On Thursday of last week, a man named Markham, formerly a keeper at the Lincoln Lunatic Asylum, made an attempt to murder an old man named Gainsley and his wife, who keep the toll-bar on the Spilsby road, about two miles from this town. He attempted to destroy them with a razor, and also by firing a loaded pistol at them, and afterwards endeavoured to commit suicide. He did not, however, succeed in either instance, but so much injured himself that he is not likely to recover.

Nottingham.—About 18 months ago a young man, of the name of John Millington, disappeared mysteriously from Holme Pierrepont, and suspicions were entertained that he had met his death through foul means. He was only about 23 years of age, and had been 13 or 14 years in the service of the Rev. J. J. Cleaver, of Holme Pierrepont, latterly in the capacity of gardener. He was about to be married, and on the 10th November, 1842, he went to Nottingham, where he purchased some articles of domestic use. He was last seen at an inn near the Trent-bridge, when it was observed that he had been drinking too freely. He left to go home by the footpath leading from Adbolton to Holme, which lies partly along the towing path of the Trent. He never arrived home, and the next morning his basket was found on the banks of the river, containing two or three wine-bottles, drained of their contents, and some other articles. Last week a skeleton was found in the water above the weir, with several articles of clothing, &c., which have been identified as belonging to the young man. An inquest was held, and the jury returned a verdict—"Found in the river Trent, but how he came there no evidence appears to prove."

Oxford.—The following is a copy of the Vice-Chancellor's decision upon the sermon on which the charge of heresy against Mr. Garbett was founded:—"The Vice-Chancellor begs to acknowledge the receipt of a copy of the sermon which, in consequence of a formal allegation of complaint, he requested Mr. Garbett to deliver to him under the provisions of the statute, Tit. XVI., sec. 11. The Vice-Chancellor having had before him since Friday, the 24th inst., the sermon which has thus been called in question, and having carefully considered what steps it might be his duty to take on the occasion, informs Mr. Garbett without delay, that in the exercise of the discretion reserved to him by the statute, he deems it unnecessary to institute any further proceeding.—St. John's College, May 29."

Plymouth.—The lighthouse recently erected on the Breakwater was lit on Saturday for the first time, and is now lit up nightly. It is distinguishable from the Eddystone by being a red light, while the Eddystone light is the usual white one. The light will be kept up without a charge upon shipping, and will be of great use to all kinds of vessels frequenting or passing Plymouth. A large sonorous bell, fixed on the west side, will be regularly rung by machinery during foggy weather.—A court-martial was held at Devonport, on board the San Josef, on Thursday, for the purpose of investigating the conduct of Mr. C. D. Newman, assistant surgeon of the Lucifer, on a charge of drawing a bill on Government for 40*l.* 15*s.*, which bill was not signed by his commanding officer, and on which he obtained the money, he being, at the same time, under stoppages, and indebted to the Crown 38*l.* 3*s.* 8*d.* The Court considered the charge to have been fully proved, and sentenced him to be dismissed from H.M.S. ship Lucifer.

Portsmouth.—The Lords of the Admiralty, with a view of ascertaining to what extent the mercantile steam navy could be rendered available for the exigencies of the service, should any emergency require their co-operation, despatched, within these few days, an officer to make a tour of inspection, and visit the steam depots and establishments of the various companies at Liverpool, Glasgow, and other ports. The establishments at Deptford, and a number of the fine steam-vessels belonging to the General Steam Navigation Company, were inspected last week by the officer deputed by the Admiralty, and it is stated that from this establishment alone 40 or 50 vessels could be supplied and armed for the service of the Government at a few days' notice, whose speed woud be superior to most of her Majesty's steam ships, as they are supplied with engines of greater power. The other steam companies in London, Liverpool, and other places have also a great number of large steamers, capable of carrying two or more guns of a large calibre, which could be placed at the disposal of Government in case of war. It is stated that long traversing guns, 32-pounders, with the necessary fixings, tackle, carriages, and ammunition, are to be collected at the various sea-ports, for the arming of the merchant steamers in case of necessity.

Romford.—The bank which carried on business at Romford under the name of Johnson and Co., we are sorry to announce, stopped payment on Thursday. The business of this bank was not extensive, and was chiefly amongst the agricultural class in the immediate neigh-

bourhood, and cattle-dealers. The principal partner is Alderman Johnson, who lately filled the office of Lord Mayor, and whose reverse of fortune is a subject of deep regret amongst his friends and acquaintances. The amount of the liabilities and probable assets has not transpired.

Weston Super Mare.—On Wednesday, a man called Joel Fisher, an innkeeper in this town, murdered his wife by fracturing her skull with an iron bar, and afterwards cutting her throat. He at once confessed that he had done so, and has since been committed for trial on the capital charge.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1364*l.*; Birmingham and Gloucester, 2227*l.*; Eastern Counties, 4724*l.*; Edinburgh and Glasgow, 2534*l.*; Great Western, 16,831*l.*; Grand Junction, 8114*l.*; Glasgow, Paisley, and Ayr, 1453*l.*: Great North of England, 1370*l.*; London and Birmingham, 18,193*l.*; South-Western, 8058*l.*; Blackwall, 995*l.*; Greenwich, 962*l.*; Brighton, 3530*l.*; Croydon, 593*l.*; Liverpool and Manchester, 4819*l.*; Manchester, Leeds, and Hull, associated, 6151*l.*; Midland Counties, 2916*l.*; Manchester and Birmingham, 3475*l.*; North Midland, 4521*l.*; Newcastle and Carlisle, 1562*l.*; South-Eastern and Dover, 5014*l.*; Sheffield and Manchester, 577*l.*; York and North Midland, 1664*l.*—The meeting of the South Eastern and Dover company took place last week. The chairman congratulated the shareholders on the prospects of the railway, and gave a comparative statement of the amount of traffic on the railway in the months of April and May in 1843, and in the present year, showing that the two months of the present year had doubled those of last year. The branch now constructing to Maidstone would shortly be opened, and would bring a considerable accession of traffic to the railway. The principal sources of traffic on this branch railway would be from the carriage of lime and coal, from which enormous profits are anticipated. He then exhibited a statement of the receipts at the Bricklayers' Arms station since its opening, and a statement of the receipts at the London-bridge station during the same period. From London-bridge they had carried 11,285 passengers, realising 526*l.*; from the Bricklayers' Arms 19,953 passengers, realising 606*l.* The Reigate station had been opened as a joint station for the London and Brighton and the Dover Companies, and had been found to be of great public advantage. The directors contemplated the formation of a branch from Tunbridge to Tunbridge Wells, a distance of 4¼ miles. All the works on the Canterbury branch had been contracted for, the surveys were making, and a meeting would be soon called for the purpose of obtaining the proprietors' sanction for raising the necessary capital. He expressed dissatisfaction at the decision of the committee of the House of Commons upon the Hastings line, and the determination of the directors to oppose the rival Bill. A statement of the accounts was then submitted, from which it appeared that the receipts since the opening of the railway were 3,401,468*l.* 13*s.* 3*d.*, and the expenses 3,296,273*l.* 17*s.*, showing a balance of 105,194*l.* 16*s.* 3*d.* This was up to the 1st of April last. From the statement of the revenue account for the half-year ending the 31st of March, 1844, it appeared that the receipts had been 79,576*l.* 3*s.*, expenses 52,746*l.* 3*s.*, leaving a balance of 26,830*l.* Mr. Cardwell, M.P., and Gen. Hodgson, were elected directors before the meeting separated.—It appears that the Birmingham Company have, through their chairman (Mr. Glyn), made the following proposals to the Grand Junction Company, with the view to settle the differences between the two boards relative to the Shrewsbury and Chester and Birkenhead lines:—"I. That the London and Birmingham and Grand Junction Companies remain distinct and separate as they now are, both in respect to their management and capital. 2. That the directors of each board be severally and exclusively responsible for their management to their respective proprietors. 3. That the existing engagements of each company be carried into effect, but that neither engage in any new enterprise without the consent of the other. 4. That the net profits of the lines, from whatever source derived, go to a common fund, out of which equal dividends shall be made on the shares of both companies." Mr. Glyn concludes his communication on the subject by remarking —"I consider it premature to enter at present into points of detail, and I am quite aware that numerous objections and difficulties may be started to this or any other arrangement, but I am unable to discover any which ought to stand in the way of the great advantage which would be thus attained, and of increasing the stability of these two great undertakings, and of restoring to the numerous body of our respective shareholders that confidence which must necessarily be shaken so long as we remain at variance."—The new town of Kingston upon Railway, which gained considerable notoriety a few years ago, and made such rapid strides with the South Western Railway, is at present in Chancery, a bill of great magnitude having been filed against the present occupiers. It is said that Sir T. Wilde and several eminent gentlemen of the bar are retained; and as the bill contains 800 folios, and the answer 2500 folios, it bids fair to find considerable employment to the lawyers. The parchment on which the answer is written consists of the skin of 78 sheep!—On Monday morning the West London railway was opened for public traffic as far as its junction with the Great Western line, but the station and other preparations at its junction with the London and Birmingham line not being completed, the opening of that portion was deferred until Wednesday. Since Monday, trains have been running to meet the 9, 11, and half-past 6 o'clock trains on the Great Western; and from Wednesday, trains have also met the 7, half-past 10, 3, and 6 o'clock trains on the London and Birmingham.—On Tuesday week, the new church, erected and endowed at Wolverton by the shareholders of the London and Birmingham Railway, and the trustees of the Ratcliffe estate, in which it is situated, was consecrated by the Bishop of Lincoln. The Railway Company have fixed their central depot at this spot, and built houses for their workmen, so that where a few years ago there was nothing but corn-fields, there is now a daily increasing town of not fewer than 1200 inhabitants, almost every one of whom is connected with the railway. The directors have done everything in their power to promote the moral and religious improvement of this new population. They have established schools for the young, and a library and reading room for adults, and for some time past divine service has been performed in the school-room by a clergyman specially appointed for that purpose. The services of Tuesday drew together a very full congregation, the church, a handsome stone building capable of accommodating about 1500 persons, being crowded in every part.

IRELAND.

THE STATE TRIALS.—We were enabled in our last to give an account of the final close of the state trials, and the sentence, which was pronounced by Mr. Justice Burton about 4 p.m. on Thursday. From that hour until five, Mr. O'Connell and the other traversers remained in the judges' chambers, whilst the necessary arrangements were in progress for their transmission to the Penitentiary, and to afford time for allaying the excitement amongst the multitudes who remained outside the courts. At a quarter after five o'clock the traversers were driven off in three carriages, surrounded by a strong force of horse police. In the first carriage sat Mr. O'Connell, Mr. John O'Connell, the High Sheriff, Mr. Ball, and the Rev. Dr. Miley. In the second carriage were Dr. Gray, Mr. Duffy, Mr. Barrett, and Mr. Ray. The third carriage contained Mr. Steele, Mr. Ford, Mr. Ball, jun., and Mr. R. O'Gorman. There was a general cry of "silence" among the crowd assembled outside the court, and great excitement prevailed. The cavalcade rapidly passed down Merchants'-quay, in order, as it seemed, to prevent the crowds from discovering its real destination; but nevertheless great numbers followed, and kept up with the carriages all the way to the Penitentiary, where they arrived about six o'clock. When Mr. O'Connell left the first carriage, a loud cheer arose from the populace congregated on the road outside. Mr. O'Connell entered the gateway, and passed through the court-yard to the house of the governor, Mr. Purdon. In the yard, a considerable number of gentlemen were waiting, arranged in two files, who uncovered as Mr. O'Connell, with hat in hand, passed between them. Mr. O'Connell recognised and shook hands warmly with the many friends who thus received him at the gates of his prison. Mr. John O'Connell, Mr. Steele, Mr. Duffy, Dr. Gray, Mr. Barrett, and Mr. Ray soon after entered, and all passed into the governor's house. The governor being absent in England, the deputy-governor, Mr. Cooper, attended to receive the prisoners from the high-sheriff. Mr. O'Connell soon after proceeded to the apartments allotted to him, where several members of his family, including his daughters, Mrs. Fitzsimon and Mrs. French, were in waiting. Mr. O'Connell, accompanied by those ladies, subsequently appeared in the gardens attached to the residence of the governor, and remained there until dinner, when he and his fellow-prisoners dined together. The Penitentiary is an immense pile of buildings, situated in a very healthy locality. The governor's house, where Mr. O'Connell and the other defendants in the State Trials are located, is a spacious mansion, with gardens attached, and the general prison is at the rear.—On Monday, on the sitting of the full court, Mr. Whiteside, Q.C., applied to their Lordships on behalf of the prisoners, to be allowed to inspect the "record" on the cause, lodged in the office of the clerk of the Crown, for the alleged object of seeing and comparing the names of the witnesses endorsed on the back of the original indictment; a proceeding, declared in the affidavit of Mr. Ford, upon which the motion was founded, to be absolutely necessary for the proper prosecution of the intended writ of error. The Attorney-General opposed the application, as being without precedent, and the Judges were equally divided in their opinions, the Chief Justice and Mr. Justice Crampton being against, and Mr. Justice Burton and Mr. Justice Perrin for it. The Attorney-General then said that two members of the Court having decided in favour of the application, he would take no further objection to counsel for the prisoners seeing the record, as suggested by Mr. Justice Burton—namely, in presence of the Court. The document was then handed to Mr. Whiteside, who, with some of his brethren, examined it for about half a minute, when it was returned to the Bench amidst the laughter of the Crown Counsel. It is calculated that, within ten days, all the necessary preliminary forms will have been complied with, and the Writ of Error regularly lodged for argument before the House of Lords.—The news of Mr. O'Connell's imprisonment seems to have caused more excitement in the provinces than in Dublin. Letters from Clonmel, Thurles, Carrick-on-Suir, Drogheda, Limerick, Dundalk, Newry, Nenagh, Kilkenny, Cork, and other places, state that the greatest excitement existed in the public mind in those places. and meetings were immediately to be held to express the sympathy and confidence of the Irish people in their "Liberator." The Repeal newspapers in Dublin are printed in mourning, as on the death of members of the Royal family, and the Corporation have called a meeting to express their condolence with Mr. O'Connell and his fellow-prisoners. It is rumoured, however, that Government intend to suppress the Repeal Association, and that they have it in contemplation to institute legal proceedings against Mr. Smith O'Brien, for speeches delivered by him on several occasions at the Corn-exchange and in Conciliation Hall.—The weekly meeting of the Repeal Association took place on Monday, Mr. C. Powell, M.P. in the chair. Mr. S. O'Brien said that Mr. O'Connell was in jail, not by the verdict of a jury, or the charge of a Chief Justice, but at the immediate instigation of the government. The court were willing to lend every assistance in allowing the traversers to remain at large till the appeal to the House of Lords was decided; they appealed to the law officers of the Crown, but these gentlemen, acting, no doubt, under instructions, resolutely refused their sanction to this reasonable suggestion. He was, therefore, justified in throwing the entire odium on the government. Every event, in his opinion, was accelerating the repeal—the result of the trials had put it beyond a doubt. The bridge was cut away—henceforth no one would dare to propose a compromise to any ministry. He would call on the members of the Catholic religion, one and all, to become Repealers. Who was it that enabled you, Richard Shiel, to wear a silk gown? O'Connell.—Who enabled you to become a member of Parliament! O'Connell.—Who enabled you to become a Privy Councillor? O'Connell.—Where are you now? He (Mr. O'Brien) would tell him that here in the Conciliation-hall was his place, guiding his countrymen by his counsels, and inspiring them by his eloquence. Every man ought at the present juncture to conduct himself as if the achievement of their object depended on his individual exertions. For himself, he would listen to no proposal short of absolute repeal. The honourable gentleman then highly eulogised the temperance movement, and begged leave to mention to the meeting a resolution he had made, and he called on Heaven to enable him to maintain it; it was this—that no intoxicating drink should enter his lips till the union was repealed. An address of sympathy was then voted to Mr. O'Connell, and the rent was handed in. Among the sums announced were 1000*l.* from Boston, America; 100*l.* from Mr. Nicholas Maher, M.P., for Tipperary, towards the fine imposed on Mr. O'Connell, with a promise to subscribe 5*l.* a month towards the Repeal rent, during the incarceration of the traversers. Money was poured in from all parts of the Hall in such amounts that the ordinary business was suspended. At 6 o'clock, Mr. S. O'Brien said: "The first week's return of rent, showing the opinion of the Irish people on the captivity of Mr. O'Connell, is 2596*l.*" The meeting then adjourned to Monday, when Mr. S. O'Brien, M.P., directed the Secretary to alter the date of the previous day's meeting to the "first week of the captivity," and for the future to date all their proceedings from that epoch. He also proposed, as members, the children of two of the conspirators, Mr. Duffy and Dr. Gray, at the suggestion of the ladies of the prisoners, as they could not themselves hold direct communication out of doors. At the close of the meeting, Mr. S. O'Brien moved, and Dr. Nagle seconded a motion to the effect, that the chair which had been occupied by Mr. O'Connell at their former meetings, should remain vacant during his absence from them. The resolution having been adopted, the meeting was adjourned to "Monday, in the second week of the captivity."

Dublin.—It is announced that the Lord Lieutenant will leave Dublin for England in about a fortnight, and that he will not again return as Viceroy.

SCOTLAND.

Edinburgh.—The election for the vacant Professorship of Music in the Edinburgh University came off on Saturday last. Since the meeting in April Dr. Wesley had resigned, and on Saturday the candidates were reduced to three—Mr. Pearson, the son of the Dean of Salisbury; Mr. Donaldson, the advocate; and Mr. Bennett, the pianist. The Senate divided thus:—14 voting for Mr. Pearson, and 11 for Mr. Donaldson. Mr. Bennett had no vote. The new Professor, Mr. Pearson, was intended for the medical profession, but for the last two years has been studying music in Germany.

Miscellaneous.

The Emperor of Russia.—The Heritier, the Grand Duke Michael, the Duke de Leuchtenberg, were all seen passing in turn—each led about by a whispering mask —"*Mais où est donc l'Empereur?*" "*Il n'y est pas encore,*" was the answer; but scarce was this uttered when a towering plume moved, the crowd fell back, and enframed in a vacant space stood a figure to which there is no second in Russia, if in the world itself—a figure of the grandest beauty, expression, dimension, and carriage, uniting all the majesties and graces of all the Heathen gods—the little god of love alone perhaps excepted—on its ample and symmetrical proportions. Had this nobility of person belonged to a common *Mougik* instead of to the Autocrat of all the Russias, the admiration could not have been less, nor scarcely the feeling of moral awe. It was not the monarch who was so magnificent a man, but the man was so truly imperial. The person of the Emperor is that of a colossal man, in the full prime of life and health, 42 years of age, about 6 feet 2 inches high, and well filled out, without any approach to corpulency—the head magnificently carried, a splendid breadth of shoulder and chest, great length

and symmetry of limb, with finely formed hands and feet. His face is strictly Grecian—forehead and nose in one grand line; the eyes finely lined, large, open, and blue, with a calmness, a coldness, a freezing dignity, which can equally quell an insurrection, daunt an assassin, [or paralyse a petitioner; the mouth regular, teeth fine, chin prominent, with dark moustache and small whisker; but not a sympathy on his face! His mouth sometimes smiled, his eyes never. There was that in his look which no monarch's subject could meet. His eye seeks every one's gaze, but none can confront his.—*Letters from the Baltic.*

Law.

POLICE.—At Queen-square office on Thursday, *Mrs. Pelham* and *Wilson Pelham*, her son, were finally examined on the charge of gross neglect and cruelty to Brent Spencer, a lunatic, the son of the first-named defendant. After a long examination, Wilson Pelham was discharged, and his mother committed for trial, but admitted to bail.—*Charles Hall*, the man who had absconded and was supposed to have murdered his wife at Wimbledon last week, has been apprehended at Sevenoaks, and committed for trial by the local magistrates.

SPORTING.

ASCOT RACES. TUESDAY.—These races commenced on Tuesday, and were honoured by the presence of the Emperor of Russia, the King of Saxony, and Prince Albert, accompanied by the Duke of Wellington, Sir R. Peel, Lord Aberdeen, and a numerous suite. The royal party were cordially received by the crowd, on first coming upon the course, and on their appearing at the windows of the royal stand, they were again enthusiastically cheered. All were plainly attired, the Emperor of Russia and the King of Saxony simply wearing blue frock coats. Shortly after the royal party had entered the stand, the gratifying fact was made public, that, in commemoration of his visit, the Emperor of Russia had announced his intention to give annually, as long as he lives, the sum of 500*l.*, to be added to the Race Fund of Ascot—thus liberally and nobly following the example of his son, who, it may be borne in mind, contributes 300*l.* every year at Newmarket, to be run for under the name of the Cesarewitch Stakes. This intelligence quickly spread from one end of the course to the other, and if the multitude was previously disposed to testify their gratitude for the royal visit, this generosity increased the feeling of admiration, which was manifested throughout the day by renewed enthusiastic cheers when opportunities were afforded, and these were frequent, for as the horses were saddled in front of the Royal Stand, previous to the races, and the jockeys returned to weigh close at hand, ceremonies to which his Majesty paid particular attention, he was constantly brought in view of the public. Both the Emperor and the King of Saxony evidently felt great gratification at the scene, and at the conclusion of the race for the Gold Vase, which was won by Alice Hawthorn, they both descended from the stand, accompanied by Prince Albert, and examined the extraordinary mare with great minuteness, the Emperor of Russia patting her with obvious satisfaction. This sympathy in British sports renewed the pleasure of the spectators, and their expressions of delight could scarce be kept within bounds, while they pressed so closely round the royal pair that the King of Saxony with difficulty escaped from their embraces. The following were the proceedings of the first day:—*Trial Stakes* of 10 sovs each: for two yrs old, 4st 4lb; three yrs, 7st 4lb; four, 8st 7lb; five, 9st; and aged, 9st 3lb. New mile. Four subs. Mr. Townley's Corranna, 5 yrs, beat Lord E. Russell's Nat, 4 yrs; Lord Chesterfield's Joan of Arc, 3 yrs; and Mr. Griffith's Hopbine, 3 yrs. Won in a canter by four lengths.—*Ascot Derby Stakes* of 50 sovs each, h ft: for three yrs old colts, 8st 7lb; fillies, 8st 3lb. Swinley course. Seven Subs. Lord Chesterfield's The Miser Scarve, beat Duke of Bedford's Panther, and Colonel Wyndham's Master Henry. Won in a canter by three lengths.—*Sweepstakes* of 50 sovs each, h ft: for two yrs old colts, 8st 7lb; fillies, 8st 3lb. Three quarters of a mile. 3 subs. Lord Albemarle's Scarmentado walked over.—***Ascot Stakes* of 25 sovs each, 15 ft: and only 5, &c. with 100 added;** the second to receive 50 sovs out of the stakes, &c. Two miles and a half. 133 subs, 109 of whom declared, &c. Mr. Payne's Johnny, aged, 7st 2lb, beat Lord Chesterfield's Knight of the Whistle, 6 yrs, 8st 7lb; Mr. F. Clarke's Arcanus, 5 yrs, 7st; Mr. F. Clarke's Priscilla Tomboy, 5 yrs, 7st; and nine others who were not placed. Won by three lengths. Arcanus a bad third.—*The Queen's Vase*, added to a Sweepstakes of 20 sovs each: for three yrs old and upwards. Two miles. 11 subs. Mr. Salvin's Alice Hawthorn, 6 yrs, 9st 4lb, beat Lord Verulam's Robert De Goreham, 5 yrs. 9st 7lb; Lord Albemarle's Delapre, 3 yrs, 7st 3lb; Lord-G. Bentinck's Bramble, 4 yrs. 9st; Lord Exeter's f by Gladiator, out of Elegance, 4 yrs, 8st 9lb; and Mr. Mostyn's Princess Alice, 3 yrs, 6st 12lb. Won in the commonest of canters by six lengths; Robert de Goreham second; the others walked in. So hollow a race was never seen before at Ascot.—*Borough Members' Plate* of 50*l.*, added to a **Sweepstakes of 5 sovs each:** three yrs, 7st; four yrs, 8st 4lb; 5 yrs, 8st 10lb; 6 yrs and aged, 9st; winners once this year, 3lb; and twice, 6lb extra. Winner to be sold for 150*l.*, &c. Old mile. 14 subs. Lord Chesterfield's The Artful Dodger, 5 yrs, beat Mr. Copeland's Imaum, 3 yrs; Colonel Peel's f by Slane, out of Seakale, 3 yrs; Mr. E. R. Clarke's Llangollan, 5 yrs; and seven others. Won cleverly by a length; the Seakale filly a good third. The winner claimed.—***Sweepstakes* of 100 sovs each, for four yrs** old. Swinley Course. 2 subs. Mr. Ford's Poison, walked over. —*St. James's Palace Stakes* of 100 sovs each, h ft, for three yrs old. Old mile. 3 subs. Colonel Peel's Ionian, walked over.

WEDNESDAY.—*Swinley Stakes* of 25 sovs each, 15 ft, with 50 sovs added: three yrs old, 7st 4lb; four, 8st 10lb; mares and geldings allowed 3lb. 7 subs. Lord Glenlyon's Ben y Ghlo, 4 yrs, beat by a length Duke of Richmond's Pastoral, 3 yrs.—*Fern Hill Stakes* of 15 sovs each, 5 ft, and 50 sovs added: two yrs old, 7st; three, 9st. About half a mile. 13 subs. Mr. Ongley's b f Mystery, 2 yrs, beat Mr. Edwards's Hedgehog, 2 yrs; M. A. W. Hill's Beaumont, 3 yrs; Lord G. Bentinck's Prince of Wales, 3 yrs; Lord Exeter's Economy, 3 yrs; and Colonel Anson's Buzz, 3 yrs. Won cleverly by a length.—*Great Ascot Produce Stakes* of 100 sovs each, h ft: for three year old colts, 8st 7lb; fillies, 8st 2lb; with 200 sovs added for the winner, and 100 for the second horse. Once round. 29 subs. Mr. Osbaldeston's Sister to Martingale (3lb), beat Colonel Peel's Zenobia (3lb); Baron Rothschild's Emerald; Lord Exeter's Crosby (3lb); Mr. J. Day's Seaport; Lord Chesterfield's Bee; and Mr. Greville's Jamaica. Won by half a length.—*Her Majesty's Plate* of 100 guineas, 3 yrs, 7st 2lb; 4 yrs 9st 2lb; 5 yrs, 10st; 6 yrs and aged, 10st 5lb. Once round. Lord Verulam's Robert de Goreham, 5 yrs, beat Lord Glenlyon's Ben y Ghlo, 4 yrs; Lord Exeter's Wee Pet, 4 yrs; Mr. Ford's The Odd Mixture, 3 yrs; Mr. Jacques's Misconception, 3 yrs; and Mr. Reeves's Tarquin, 4 yrs. Won by five lengths.—*Royal Hunt Cup* of 200 sovs, with 100 added; for three year olds, &c. New mile. 32 subs. Sir R. W. Bulkeley's Bishop of Romford's Cob, beat Col. Anson's Attila, 5 yrs, 9st 4lb; Lord Exeter's Maria Diaz, 4 yrs, 6st 9lb; and 14 others who were not placed. Won by a length.—*Coronation Stakes* of 100 sovs each, h ft: for three yrs old fillies, 8st 7lb each. New mile. 9 subs. Col. Anson's The Princess, beat Lord Exeter's Mocha, in a canter by two lengths.

THURSDAY.—The races this day were honoured by the presence of the Queen, Prince Albert, the Emperor of Russia, the King of Saxony, and a numerous suite. The royal party were loudly cheered on their arrival and departure from the course. *Windsor Forest Stakes* of 50 sovs each, h ft: for three yrs old fillies, 8st 7lb each; Old mile. 4 subs. Lord Verulam's Charlotte beat Mr. Phillimore's Skeleton, and Mr. Ford's Eccola. Won by a neck. *New Stakes* of 10 sovs each, with 100 added: for two years old colts, 8st 7lb; fillies, 8st 3lb. T.Y.C. 33 subs. Mr. R. Newman's Bloodstone, by Bubastes, beat Mr. J. Day's Old England, Mr. Mostyn's Pantasa, and 12 others who were not placed. Bloodstone took the lead, made strong running all the way, and won by six lengths. Mr. Day, however, claimed the stakes, on two grounds; first, that the winner is three years, and secondly, that he is improperly described as by Bubastes. Both points stand over until the horse has been examined. The most notable fact, however, remains to be told. Mr. Newman engaged Bell to ride his horse on Wednesday, and in doing so instructed him to run a quarter of a mile, and "get a taste of Old England," and then to pull him up; "on no account to win," as the horse had heavy engagements for which he wished to reserve him (the Derby and St. Leger, besides several others). Bell communicated his orders to one of his masters the same evening, and on the day of the race to a gentleman well known on the turf, whose opinions coincided with the determination he had previously made, viz, to do his best to win, and expose the contemplated fraud. The stewards, it is said, do not mean to let it pass unnoticed.—*Sweepstakes* of 50 sovs each: for three year old colts, 8st 9lb; fillies, 8st 5lb. New mile. 3 subs. Sir G. Heathcote's Campanero, beat Mr. Ford's Sir Diggory Diddle, in a canter by two lengths.—*Gold Cup*, value 300 sovs, by subs of 20 sovs each, with 200 added from the fund; the second to receive 50 sovs out of the stakes: three yrs, 6st 10lb; four, 8st 5lb; five, 9st; six and aged, 9st 3lb; m and g allowed 3lb. About two miles and a half. 21 subs. Lord Albemarle's c by Defence, d by Reveller, out of Design, 3 yrs, beat Mr. Townley's Corranna, 5 yrs; Col. Peel's Ionian, 3 yrs; Sir R. Bulkeley's Bishop of Romford's Cob, 4 yrs; and four others who were not placed. Won, to the surprise of everybody, by an untried horse, by a length. Lord Albemarle also won the Cup last year with Ralph.—*Grand Stand Plate* of 50*l.*, added to a Sweepstakes of 5 sovs each. Once round and a dis. 11 subs. Lord Albemarle's Delapre, 3 yrs, 6st 13lb, beat Lord Exeter's Maria Diaz, 4 yrs, 7st 6lb; Sir G. Heathcote's f by Velocipede, out of Miss Wilfred, 3 yrs, 5st 4lb; and 5 others. Won by a length.—*Dinner Stakes* of 100 sovs each, h ft, for three yrs old. Old mile. 18 subs. Col. Peel's Orlando walked over.

FRIDAY.—*Match.*—Jewess beat Trapola.—*Wokingham Stakes —First Class.*—Mr. Stanbrough's Isleworth beat Mr. Balchin named Windsor, Mr. Udney named Nininka colt, and Mr. Little's Dahlia. Won by two lengths.—*Wokingham Stakes—Second Class.*—Mr. S. Herbert named Moustache, beat Lord E. Russell's Nat by a head.—*Windsor Town Plate.*—Lord March's Jewboy, beat Mr. Greville's Portumnus and eleven others.—*Match.*—Assay received forf. from Bother'em.

Conyers, Esq.—4th inst., at Prince's-place, Kennington, JANE BUNSTER, relict of the late H. Bunster, Esq., of Cornwall, aged 100.

INTERESTING TO LADIES.—TO MESSRS. ROWLAND & SON, 20, Hatton Garden, London.—"Percy Place, Landport, Portsmouth, April 4, 1844. GENTLEMEN,—I think it but an act of justice to inform you of the benefit I have derived from the use of your admirable Macassar Oil. About six months ago I found my hair getting daily more weak and thin, and much discoloured from a practice I had adopted of wetting it continually; fearing that I should lose it entirely, and hearing of the efficacy of your Macassar Oil, I have for some time past constantly used it, and the result is, that my hair is now perfectly restored and much improved in appearance and colour, having become thick, dark and glossy; it also curls freely without the use of paper, which it never did before. To all my friends I have warmly recommended your Macassar Oil as an excellent restorative and preservative for the Hair. As I have an objection to see my name in print, I beg you will not publish it; but you are at liberty to show this letter, or make any other use you please of it, and refer applicants to me if necessary, in proof of the efficacy of your Macassar Oil. Your Obt. Servant *"

ROWLAND'S MACASSAR OIL preserves and reproduces the Hair; prevents it from falling off or turning Gray; changes Gray Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

*** Ask for "ROWLAND'S MACASSAR OIL." All others are Fraudulent Counterfeits.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

THE BEST ENGLISH WATCHES.—A. B. SAVORY and SONS, Watchmakers, 9, Cornhill, London, opposite the Bank, request the attention of purchasers to their stock of London-made PATENT LEVER WATCHES, which are manufactured by themselves, in their own house. In silver cases, with the detached escapement and jewelled, the prices are four and a half guineas, six, and eight guineas each; or in gold cases, 10, 12, 14, and 16 guineas each. The very large stock offered for selection includes every description, enabling a customer to select that which is more particularly adapted to his own use.

WANTED IMMEDIATELY in the country, about 12 miles from Bristol, a steady, sober, civil, industrious, middle-aged, married man and his wife, if without incumbrance the more preferable, as a general servant. He must be a really good milker, as he will have 2 or 3 cows to attend to, and take care of horses and gig. He will have weekly wages, and an excellent cottage to reside in during his service, a short distance from his employer's house. An unexceptionable character is required. Further particulars (post paid) 39, Bridge Street, Bristol.

WANTED, at Michaelmas next, a Man and his Wife, free of all encumbrance. The Man must understand stock and farming; the Woman milking, cheese, and butter-making, also the care and rearing of poultry. None need apply who cannot give the highest and longest reference for character, as X. Y. will make all inquiries in person. Honesty, industry, and very good temper, are the greatest requisites, as all their movements will be directed for them.—Direct to X. Y., Post-office, Sidbury, near Honiton, Devon.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A married Man, 28 years of age, with very little incumbrance. He perfectly understands Horticulture in all its branches. Every satisfaction can be given as to abilities, sober habits, &c., from the gentleman he has now left; also, three years' previous character, if required.—Direct to J. F., 2, Marson-street, Philip's-buildings, Somers Town, London.

AS HEAD GARDENER.—A steady, active, married Man, 31 years of age, who thoroughly understands his business in all its branches. Can have an unexceptionable character from the lady he is about to leave, with whom he has lived nearly four years. Will be at liberty in a month, or sooner if required.—Direct to G. S., Mr. Laing's Nursery, Twickenham, Middlesex.

AS GARDENER.—An active, married man, without incumbrance, aged 40, of respectable habits, and well experienced in all the superior branches of Gardening, Early Forcing of all kinds, Flower and Kitchen Garden. No single-handed place will be accepted.—Direct to B. B., Post-office, Hays, Kent.

AS GARDENER.—A respectable married Man, aged 38 years, who understands Pines, Grapes, Early Forcing, Kitchen, and Flower-garden. Most satisfactory testimonials, and three years' character will be given.—Direct to R. S., Chelsham Lodge, near Croydon, Surrey.

AS GARDENER.—JAMES CRUIKSHANK, Gardener to the Earl of Lonsdale, at the Castles of Lowther and Whitehaven, in consequence of the decease of his late venerable Employer, will be at liberty to ENGAGE with any Nobleman or Gentleman after the 30th June next. He has had the entire management of his Lordship's Gardens, in all the various departments, for the last six years; has had great experience in Forcing, and is well acquainted with flowers. Any Nobleman or Gentleman contemplating extensive improvements, or requiring a Gardener in the highest departments of his profession, on applying, will meet with due attention. Can produce the highest testimonials; is married, and has a family.—Direct to him at Lowther Castle, Penrith, Westmoreland, until the 4th of July.

A GENTLEMAN whose Garden has been long known and admired—(from an alteration in his family)—is desirous of getting a place for his Gardener, who is a married Man with two children; a good general Gardener, and accustomed particularly to the growth of Geraniums and decorative Gardening. For further reference apply to Mr. KNIGHT, Exotic Nursery, Chelsea.

THE Advertiser, a Middle-aged Man, well acquainted with the management of land, and now living upon his income, is desirous of being employed either as a LAND STEWARD to any Nobleman or Gentleman (to whom he could devote the whole of his time), or in any other respectable way. Salary not so much his object as employment. The most satisfactory references can be given.—Direct to B. Q., care of Mr. Ash, Stationer, 5, Wellington Street, London Bridge.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

FLOWER SHOW.—The WEST LONDON GRAND FLORICULTURAL EXHIBITION under the Superintendence of Mr. J. T. NEVILLE, of Ebenezer House, Peckham, will be held in the Grounds of the Almshouses of the Butchers' Charitable Institution, at Walham Green, Fulham, on Tuesday the 25th, and Wednesday the 26th of June, in Aid of the Building Fund, for Prizes of 2 Silver Cups, and 29 Silver Medals. Lists of the Prizes and Rules may be obtained by application to Mr. Neville.

RAY SOCIETY.—INSTITUTED 2ND FEBRUARY, 1844.

This Society has been formed upon the principle of the Parker, Camden, Sydenham, and other Societies, for the purpose of securing to those attached to the study of Natural History, such works on the various branches of Zoology and Botany as could not be obtained by any other means. The Council have great pleasure in stating that the number of subscribers already amounts to nearly three hundred, and beg to call the attention of their friends to the necessity of sending in their names as early as possible in order that they may be enabled to determine the number of copies of their works which they ought to print. The Council hope to publish two volumes before Christmas, the first of which will consist of transiations from the German and Italian, on the progress of Zoology and Botany during the past year. The following are the rules of the Society:—

I. That this Society shall be called THE RAY SOCIETY; and that its object shall be the promotion of Natural History, by the printing of original works in Zoology and Botany; of new editions of works of established merit; of rare Tracts and MSS.; and of translations and reprints of foreign works which are generally inaccessible from the language in which they are written, or from the manner in which they have been published.

N.B.—It will be a direction to the Council that they shall not print anything that appears to them suitable to the Transactions of established Societies; nor any work which a respectable publisher shall undertake to publish without charge to the author.

II. Every subscriber of **One Guinea annually to be considered** a Member of the Society, and to be entitled to one copy of every book published by the Society during the year to which his subscription relates; and no Member shall incur any liability beyond the annual subscription.

III. That the annual subscriptions shall be paid in advance, and considered to be due on the 2d day of February in each year; and that such Members as do not signify their intention to withdraw from the Society before the 2d day of June shall be considered to continue Members, and be liable for the year's subscription.

IV. The management of the Society shall be vested in a Council of Twenty-one Members, of whom one-third shall have their stated residences in London, and all of whom shall be eligible for re-election at the annual meeting.

V. That the Council hereafter shall be elected by the Members, at a meeting to be held at the time and place of the meeting of the British Association for the Advancement of Science, and that no Member whose subscription is in arrear be allowed to vote at any meetings.

VI. That the Council shall elect two Secretaries (one of whom shall be resident in London) and a Treasurer who shall *ex officio* be Members of the Council.

VII. The annual subscription shall be deposited in a chartered bank, in the name of the Treasurer and two Members of the Council.

VIII. The accounts of the receipt and expenditure of the Society shall be examined annually by two Auditors appointed by the Council; the Auditors to be Members of the Society who are not Members of Council, and their statement circulated among the Subscribers.

IX. That the number of copies of the Society's publications shall, unless otherwise directed by the Council, be limited to the number of actual Subscribers who shall have been enrolled, and paid their subscriptions, on or before the 2d day of June.

X. That the Editors of Works published by the Society be entitled to a number of copies, not exceeding 20, as may be decided by the Council.

COUNCIL, 1844—6.

Chas. C. Babington, M.A., F.L.S., G.S., Cambridge.
J. H. Balfour, M.D., Prof. of Botany in the Univ. of Glasgow.

ROSES IN BLOOM.—WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD & SON beg leave respectfully to invite the attention of the Nobility, Gentry, and Amateurs to their extensive Nursery Stock, extending over Forty Acres of Ground, Fourteen of which are cultivated with ROSES, now coming into splendid bloom, and will continue in flower during the Rose season.

There is a carriage drive through the Nursery, with arbours fitted up for the accommodation of parties desirous of inspecting the Roses.

Admittance GRATIS daily (Sundays excepted). The Lewes Coach passing through Maresfield leaves the Golden Cross, Charing Cross, every Tuesday, Thursday, and Saturday morning, returning the alternate days.

Maresfield is 12 miles distant from Hayward's Heath station of the London and Brighton railway.

THOMAS CRIPPS respectfully offers the undermentioned NEW FUCHSIAS.

Fuchsia	Lowryii	each	2s. 6d	Fuchsia	Stormontii	each	5s. 0d
,,	Prince of Wales (Epps')		2 6	,,	Queen		7 0

A selection of 12 from the above, if left to T. C., 31s. 6d., or to the purchaser, 42s. 6d.

Strong plants of the Double White Brugmansia 10s. 6d.; Small ditto 7s. 6d. each.

A remittance from unknown correspondents is requested. Catalogues of Fuchsias and Miscellaneous Plants will be forwarded on application.—Tunbridge Wells Nursery, June 14.

JOSEPH FRYER begs to offer his choice Collection of New Fuchsias, which are particularly fine and healthy, and of which he will supply good showy esteemed varieties at 6s. to 9s. the dozen, and any of the finest varieties sent out last year at 12s. per dozen, such as Exoniensis, Lowryii, Eppsii, Gem, Iveryana, Stanwelliana, Rogersiana, Toddiana, Brockmanii, Laneii, Cormackii, St. Clare, Tricolor, Speciosa, &c.; and all the new varieties which have been sent out this spring will shortly be ready for delivery at moderate prices, orders for which can now be taken, and will be executed in the priority they are received. J. F. likewise begs to offer his choice collection of Pansies, finest varieties, from 6s. to 18s. per dozen; newest Petunias, 12s. per dozen, including Punctata; finest varieties of Verbenas, 6s. to 9s. per dozen; and fine plants in bloom of Thunbergia Fryerii, 2s. 6d. each; all of which can be sent post free, or stronger plants carefully packed in hampers, and something added to compensate for carriage. Clarendon Nursery, Camberwell, London.

SPLENDID EXHIBITION OF ROSES.

A. PAUL AND SON'S COLLECTION, comprising all the novelties of the season, is now in full bloom.—Nurseries, Cheshunt, Herts, 13 miles from London, near the Waltham Cross Station on the Northern and Eastern Railway.

LOUDOUN'S COMPOUND for VINES.—It is a well-known fact in Agricultural Chemistry, that the best Manure for Plants is that produced from the decayed vegetable matter derived from the identical leaves and branches of the Plant which is to be improved by Manure. This fact was practically ascertained by those who improved the Vineries and Peacheries in France, long before Liebig had discovered the law which rules over the nutrition of plants. The great difficulty, however, is to obtain, in a country like ours, a sufficient quantity of decayed Vines, so as to employ them as Manure. This difficulty no longer exists; we have imported from abroad a sufficient quantity of this Manure, prepared, which we offer to the cultivators of the Vine, at 30s. per cwt. Any orders will be executed by application to Messrs. LOUDOUN and Co., No. 27, Mincing-lane, City, London.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains occasionally dissolved in the water used with Plants produce a vigorous growth and splendid flowers. If what is called a "*Liquid Guano*" is desired, a superior article is obtained at half the usual cost, by dissolving HALF A BOTTLE of this powder in a *quart of water*, and using a table-spoonful to a gallon in watering flower-beds. *Sold in bottles, 1s. 9d. each*, by Chemists and Seedsmen. Agents, DAVY, MACKMURDO, and Co., 100, Upper Thames-street, London.

DRYING BOTANICAL SPECIMENS.

W. AND J. BENTALL beg to inform their Botanical Friends that they continue to prepare their Improved PAPER for DRYING PLANTS, and hope still to enjoy their patronage and support.

For the convenience of Collectors of Foreign, as well as British Plants, the Paper is now prepared in three sizes, and is delivered free in London, on the following terms: 16 by 10 ins., (folded), 14s. per Ream; 20 by 12 in., 20s. do.; 16 by 20 ins. (double the first named size), 25s. do. Specimens forwarded on application, and all orders promptly executed.

Paper-Mills, Halstead, Essex.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, inexecuting the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.
Registered under 6 & 7 Vict., Cap. 65.
No. 130, FLEET STREET, LONDON.

BURBIDGE and HEALY respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, BURBIDGE and HEALY refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. GLENDINNING, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.	Flue Door.	Damper.	Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ s.	s.	s. d.	s. d.	s. d.		
10	1 5	20	7 6	6 6	2 6	30 feet.	12 to 20
Ribbed Boiler.							
10	2 2	20	10 6	7 6	2 6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12 6	7 6	3 6	80 to 125 feet.	40 to 65
14	3 10	35	17 5	8 6	4 6	150 to 250 feet.	65 to 100
18	5 5	42	25 0	8 6	5 6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35 0	8 6	7 6	600 to 800 feet.	

If 3 inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

IRON WORKS.

COTTAM AND HALLEN, WINSLEY-STREET, OXFORD-STREET, LONDON.

GARDEN ROLLERS and RICK-STANDS, or STATHELS, at very low prices.

GARDEN SYRINGES, 9s. 6d. each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 20 inches, and 22 inches.

CAST-IRON FLOWER-STAKES, 4 ft. long out of the ground, 4 ft. 6 in., 5 ft., 6 ft., and 7 ft.

Watering-pots, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases in great variety, and every description of article used in Horticulture.

BEST WIRE, for STRAINED WIRE-FENCING, at 8s. 6d. per bundle of 150 to 160 yards each.

Flower-bordering, Trainers, Garden Arches, Flower-stands, Rose-tree Guards, and every description of Ornamental Wire-work, for Gardens, &c.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years' experience, and having fixed upwards of 1500 Apparatus for the above-mentioned purposes, and by various improvements which they have made during that time.

RENDLE'S TANK SYSTEM on an improved simple plan.

Show Rooms at their Manufactory, No. 2, Winsley-street, where estimates and every information may be obtained.

AGRICULTURAL IMPLEMENTS.

DOUBLE-MOTION HAYMAKERS of the best construction, made almost wholly of iron, and containing the double Cylinder, and all the latest improvements, are now ready.

CAST-IRON RICK-STANDS and PIGTROUGHS, at very low prices.

IRON HURDLES AND FIELD-GATES of all sizes, at exceedingly low prices.

PLOUGHS, DRILLS, Sheep and Cattle Weighing Machines, Improved Prize Harrows, Field Rollers, Turnip cutters, Chaff-cutting Machines, Threshing and Winnowing Machines, Oil-cake Breakers, and every description of Implements used in Agriculture.

Show Rooms at their Manufactory, 2, Winsley-street, Oxford-street, where every information may be obtained.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Hothouse Builders, &c., Gloucester-place, Chelsea, beg to inform Horticulturists that they have made great improvements in their excellent and simple plan of Shading, whereby the largest or smallest can be instantly covered or uncovered with a sheet of canvas. To be seen in use at most of the London Nurseries, and at the Horticultural Manufactory, Gloucester-pla., Chelsea, near Sloane sq.

Sales by Auction.

WINDING UP SALES.

TO GENTLEMEN, FLORISTS AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition at the Auction Mart, Bartholomew-lane, on Tuesday, June 18th, and Friday, 21st, 1844, at 12 o'clock each day, A FINE COLLECTION OF DAHLIAS, comprising all the leading varieties. Also a splendid assortment of GERANIUMS, the newest varieties of FUCHSIAS and VERBENAS, HEARTSEASE, and a variety of other Flowering Plants, being the last Sales for this season.—May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

SYDENHAM, KENT.

MESSRS. PROTHEROE AND MORRIS will submit to public competition on the premises, BRIAR COTTAGE, near the Dartmouth Arms, Sydenham, on THURSDAY, 20th JUNE, 1844, at 1 o'clock, the Entire Stock of CHOICE TULIPS, the collection of the late Mr. William Granger Jackson, comprising all the esteemed kinds in cultivation. Also IRON HOOPS and CANVAS, One and Two-Light BOXES, HAND-GLASSES, GARDEN UTENSILS, Sundry HOUSEHOLD FURNITURE, and other Effects. May be viewed one day prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, &c.

MESSRS. PROTHEROE AND MORRIS have received instruction from Mr. BUNNEY, to submit to public competition on the premises, KINGSLAND NURSERY, about the second week in July, in consequence of the Lease having expired, the whole of the RARE EXOTICS and other Plants in pots; also SEVEN GREENHOUSES, PITS, &c. &c., in good condition, a quantity of Bricks, York Paving, and other Fixtures. May be viewed prior to the Sale, and Catalogues may be had of the principal Seedsmen, on the Premises, and of the Auctioneers, Leytonstone. The whole of the valuable Nursery Stock will be submitted to public competition by Auction about the third week in October.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. J. KING begs to inform the public that he is instructed to sell by Auction on the premises, Acre Lane, Brixton, on Monday, 17th June, at 10, by order of Mr. DAWSON, a COLLECTION OF CHOICE PLANTS, viz.:—Camellias, Ericas, Epacris, Barrones, Serulata, Oleanders, Azaleas, Cacti, Croweas, Euonymus, Daphne, Polygaleæ, and a variety of other Plants. May be viewed, and Catalogues had on the premises, at Mr. CLERK'S, Seedsman, Bishopsgate Street, and of the Auctioner, Hackney Road.

GREENHOUSES and PLANTS to be SOLD by AUCTION, by Mr. JOHN KING, on the premises, Montpelier Gardens, Walworth, on WEDNESDAY, June 19, at Ten o'clock, by order of Mr. Craig (whose Lease expires at Midsummer next) Three capital Greenhouses, 2200 Geranium and other Greenhouse Plants, of the best sorts; Herbaceous Plants, Tools, &c. &c.—May be viewed, and Catalogues had on the Premises; of Mr. CLARK, Seedsman, Bishopsgate street; and of the Auctioneer, Hackney-road.

TO FLORICULTURISTS.

LAHEE AND SON will SELL by AUCTION, by order of Mr. STORY (retiring to the country), at his Residence, Isleworth, on Tuesday, June 18, and following day, at 12, his extensive and superb COLLECTION of STOVE and GREENHOUSE PLANTS, consisting chiefly of Specimen and Hybrid Ericas, Azaleas, Camellias, &c., comprising more than 2000 Plants, a Span House, Prepared Soil, Flower-Van, and, if not sooner disposed of, the Lease of the House, capital Gardens, and Paddock. To be viewed three days, on Thursday, Friday, and Monday preceding. Catalogues may be had on the premises, and at LAHEE and SON'S Offices, 65, New Bond street.

CAPITAL INVESTMENT.—IMPROVABLE ESTATE in AYRSHIRE, with SALMON-FISHINGS, GROUSE-SHOOTING, &c.—FOR SALE IN ONE OR MORE LOTS.

THE ESTATE OF BALLANTRAE, extending to about 7164 acres imperial, with the Village and Harbour and the valuable Salmon-Fishings of the River Stinchar and the adjacent Sea-coast.

The Lands immediately around the village, about 1587 acres, form a compact and beautiful Estate, lying on both sides of the River Stinchar, and nearly two miles along the Frith of Clyde, and they afford many fine situations for a residence. The land in this division is arable, of superior quality, and capable of great increase of value by draining, planting, and better cultivation. The remainder of the Estate, about two miles distant, consists of excellent Stock Farms, capable also of great improvement, by surface-draining and liming, and affords some of the best Grouse-shooting in the south of Scotland. The River Stinchar, and other streams on the Estate, abound with Salmon and Trout.

The present rental is only 1891*l.* 2*s.*; but the principal Farms are let at very low rents, and a considerable rise may be counted on. The public burdens payable by the proprietor are of trifling amount. The great post-road to Portpatrick passes through the village, and if the proposed improvements on the harbour are completed, Ballantrae will be the Shipping Port of the whole vale of Stinchar; and, with its valuable Fisheries, must become a place of some trade and importance. Ballantrae is about 15 hours' sail from Liverpool, 6½ hours' sail from Glasgow, and 12 miles from Girvan, to which latter place it is now in contemplation to continue the Ayrshire Railway.

If not immediately sold in one Lot, the Estate will be exposed as follows:—

1st. The MOOR LOT, extending to about 5577 acres, of which the present land rental is £375 0 0
And the shooting for the present season is let at 50 0 0

Total rent . £425 0 0

2d. The FARM of LAGGAN and LAGGANHOLM, as at present possessed by Hugh Lockhart, James M'Millan, John Murray, Mrs. M'Kinna, &c., with 13 acres of thriving young Plantations, extending to about 450 acres, at present let at £416 4 3

There is a neat, small, modern Mansion on this lot, and a good Farm-house, and the principal part of the Land is out of lease at Martinmas next.

3d. The REMAINDER of the LANDS of LAGGAN and GARLEFFAN, including the Mill and Mill Lands, extending to about 232 acres, at present let at £175 0 0

4th. The LANDS on North side of the River Stinchar, with the Salmon-Fishing, Harbour, and Village, extending to about 905 acres, at present let at 874*l.* 14*s.* 9*d.*, will be exposed along with Lots 2d and 3d, but will not be separately sold till these two Lots are disposed of.

James M'Gregor, Ballantrae, will show the Lands; and for further particulars application may be made to George Gairdner, Esq., factor, Culhorn, near Stranraer; or to Æneas Mackean, Writer to the Signet, Edinburgh.—Edinburgh, 24th May, 1844.

PRIZES OPEN TO ALL ENGLAND will be awarded by the THANET HORTICULTURAL SOCIETY, on THURSDAY, the 27th inst.

Best six Geraniums	£2	2s.	0d.
Best six Miscellaneous Plants	2	2	0

Place of Exhibition, Ranelagh Gardens, two miles from Margate. J. G. HODGSON, Hon. Sec.
St. Peter's, June 15, 1844.

ROSES.—GREAT BERKHAMPSTED, HERTS.

MESSRS. LANE AND SON beg to announce to their Patrons and the Public generally that their extensive Collection of ROSES are now in FULL BLOOM; and that for the accommodation of parties resident in and beyond town, the London and Birmingham Railway Company have kindly appointed an extra train, which leaves Euston-square at half-past 10 A.M., for which, as well as for other trains, day-tickets are issued at one-third the ordinary fares.

The Nurseries are within about five minutes' walk of the Berkhampsted station.—June 14, 1844.

The Gardeners' Chronicle.

SATURDAY, JUNE 15, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY, June 18	Linnean	. . . .	8 P.M.
WEDNESDAY, June 19	Microscopical	. . .	8 P.M.
SATURDAY June 22	Royal Botanic	. . .	4 P.M.

WHAT a curious hallucination that is which supposes the SAP OF TREES TO FALL, or settle, in winter, into the roots! One would have thought that the notorious difficulty of cramming a quart of water into a pint measure might have suggested the improbability of such a phenomenon. For it certainly does require a very large amount of credulity to believe that the fluids of the trunk and head of a tree can, by any natural force of compression, be compelled to enter so narrow a lodging as the root. The idea, however, has established itself in some persons' minds, and, we presume, in connection with that other old vulgar error, that the sap is in rapid motion in the spring time, in the roots of a tree, before it begins to flow in the branches.

These whimsies took their origin in days when the world was contented to accept assertions upon trust, and when hypotheses and vain imaginings formed the debased paper currency of science. But now men have found out the value of a golden standard, both for money and for knowledge; they call for facts before theories; and the result, already, is a wonderful disturbance in the crowded ranks of scientific as well as historical legends.

We shall assume the word SAP to signify the fluids, of whatever nature, which are contained in the interior of a tree. In the spring this sap runs out of the trunk when it is wounded; in the summer, autumn, and winter, it does not, unless exceptionally, make its appearance. But in truth the sap is always in motion, at all seasons, and under all circumstances, except in the presence of intense cold. The difference is, that there is a great deal of it in the spring, and much less at other seasons.

When a tree falls to rest at the approach of winter, its leaves have carried off so much more fluid than the roots have been able to supply, that the whole of the interior is in a state of comparative dryness, and a large portion of that sap which once was fluid, has become solid in consequence of the various chemical changes which it has undergone. Between simple evaporation on the one hand, and chemical solidification on the other, the sap is in the autumn so much diminished in quantity, as to be no longer discoverable by mere incisions. The power that a plant may possess of resisting cold is in proportion to the completeness of this drying process.

When the leaves have fallen off, the tree is no longer subject to much loss of fluid by perspiration, nor to extensive chemical changes by assimilation, for the leaves are the principal organs of perspiration and assimilation. But the absorbing power of the roots is not arrested; they, on the contrary, go on sucking fluid from the soil, and driving it upwards into the system. The effect of this is, that after some months of such an action, that loss of fluid which the tree had sustained in autumn by its leaves, is made good, and the whole fabric of the plant is distended with watery particles. This is a most wise provision, in order to insure abundant food to the new-born leaves and branches, when warmth and light stimulate them into growth.

During all the winter period the sap appears indeed to be at rest, for the re-filling process is a very gradual one. But M. Biot, many years ago, proved, by an ingenious apparatus, that the rate of motion of sap may be measured at all seasons; and he ascertained it to be in a state of considerable activity in midwinter. Among other things he found that heat had considerable influence upon the direction in which sap moves. In mild weather the sap was constantly rising; but when frost was experienced the sap flowed back again—a phenomenon which he referred to the contracting influence of cold on the cells of the trunk and branches, the effect of which was to force the sap downwards into the roots, lying in a warmer medium; then, again, when the frost reached the roots themselves, and began acting on them, the sap was forced back into the trunk; but as soon as a thaw came on, and the ground recovered its heat, the roots out of which a part of the sap had been forced upwards, were again filled by the fluids above them, and the sap was forced to fall. A large Poplar-tree, in the latter state, having been sawed across at the ground-line, the surface of the stump was found to be dry, but the end of the trunk itself dripped with sap. Sap, then, is always in motion; and if it ever settles to the root in a visible manner, that is owing to external temporary causes, the removal of which secures its instant re-ascent.

As to the idea that the bleeding of a tree begins first at the root, and, in connection with this supposition, that what is called the rise of the sap is the cause of the expansion of buds, and leaves, and branches, nothing can well be more destitute of any real foundation. If in the spring, when the buds are just swelling, a tree is cut across at the ground-line, no bleeding takes place, neither will the sap flow for some distance upwards, but among the branches the bleeding will be found to have commenced. Let the line A B represent the trunk and branches of a tree; let incisions be made at *c*, *d*, *e*, *f*; the sap will run at *c* first, then at *d*, next at *e*, and last at *f*, next the roots. This was observed some years ago by Mr. Thomson, at that time the Duke of Portland's gardener, who thought he had discovered that the sap of trees descends in the spring, instead of ascending: a strange speculation enough, it must be confessed. The fact is, that the sap is driven into accelerated motion, first at the extremities of a tree, because it is there that light and warmth first *tell* upon the excitable buds. The moment the buds are excited they begin to suck sap from the parts with which they are in contact; to supply the waste so produced, the adjacent sap pushes upwards; as the expansion of the leaves proceeds, the demands upon the sap near them become greater; a quicker motion still is necessary on the part of the sap, in order to make good the loss; and thus, from above downwards is that perceptible flow of the fluids of trees, which we call the bleeding, effected.

A correspondent remarks that the well-known fact of trees sprouting in the spring, although felled in the autumn, proves that the sap had not at that time quitted the trunk to take refuge in the roots. And we agree with him in considering that such a common occurrence should have put people on their guard against falling into the vulgar errors on this subject.

WE are happy to find from our correspondent that several NEW AND USEFUL BRANCHES OF CULTIVATION are likely to be adopted in some of the most favoured of our West India Islands. Amongst them the small but beautiful island of St. Vincent has recently taken a conspicuous lead in the growth of Tobacco, the Nutmeg, Clove, and Arrow-root, the Maranta arundinacea. It is to this latter production we wish at the present more immediately to call the attention of our readers. For a long time, its scarcity and high price caused it to be considered merely as a medicine; and it was only sold by chemists and druggists at the enormous price of from 2*s.* to 5*s.* the pound; but now, from the vastly increased quantity grown, it may be obtained at a reasonable rate—at 1*s.* 3*d.* to 1*s.* 8*d.* the pound—with an increased facility of getting it genuine.

The starch of this valuable plant has long been recommended by medical men as the most nourishing of all food for children and invalids. It is now coming into general and deserved estimation; and we can hardly doubt that at no very distant period it will become an article of consumption as much in request as either sugar or tea. The Bermuda Arrow-root was at one time considered the finest, and perhaps this was the case as long as the cultivation and manufacture were confined to the black and coloured population; but since the proprietors of Sugar and Coffee estates have given it their consideration as a staple article of export, we think this early prejudice must cease. The soil in our windward and leeward islands is so much superior to anything that Bermuda can boast of, and all of them being amply supplied with the finest streams, wherein Bermuda is unfortunately deficient, we think it must follow as a necessary consequence that the Arrow-root of the before-mentioned islands will eventually prove of the finer quality.

The manufacture of Arrow-root depends materially on the purity of the water with which it is washed; and as the Bermudians have to rest satisfied with such rain-water as they can collect in the marble tanks they appropriate for the purpose, that island cannot maintain its fancied superiority. Many of the negroes throughout the West Indies, having purchased houses and lands in the mountain districts, have no objection to aid in its cultivation or manufacture, although they decline working on the sugar estates, for the labour is lighter; and as it is always grown in mountain situations, in order to be near the heads of springs, the labourers have little or no distance to go from their houses to their work. Its cultivation may thus become the means of reclaiming a portion of the population from the listless and idle habits at present prevailing.

Liebig asserts that 4 lbs. of Arrow-root contain as much nourishment as 15 lbs. of butchers' meat, or, what is the same thing, 1 lb. of Arrow-root contains as much carbon as $3\frac{3}{4}$ lbs. of meat. The skilful practitioner has already availed himself of this condensation of nourishment, by ordering it as a food for infants. But its use does not stop here; it is extensively used by the metropolitan surgeons in the cure of ulcers, especially those produced by burns. It is also used in the manufacture of English gum.

Treated with nitric acid of density 1.5, it is said to be converted into a most explosive compound—nitramidine, which Pelouze has recommended for the Artillery service. Dumas, a chemist of great celebrity, says that, used in the proportions of 1-6th or 1-4th mixed with Wheat-flour, it renders bread infinitely more nutritious. It is used by biscuit-bakers; and we have the authority of Demetrius Dumadow for stating that it is used in the manufacture of the finest description of cards, as well as by confectioners and pastrycooks. It is extensively consumed in getting up our calicoes, linens, and cottons, not giving them that yellow colour which common starch invariably does. We cannot, therefore, but congratulate our colonists that something like necessity has driven them to the adoption of a cultivation which is likely to become important to themselves as an article of export, as well as to this country by supplying it with a cheap, delicious, and economical food.—*M.*

PROPAGATION OF ROSES BY CUTTINGS.

IT is generally believed by amateurs and others, that Moss, Provins, French, Damask, and Bourbon Roses, &c., are difficult to increase by cuttings; but by the following method, these sorts may be raised in abundance. Let a bed of well-fermented stable litter and leaves be made by the side of a north wall, and place a one or two-light frame on it so as to face the north. In this put about eight inches of leaf-mould that has been previously well soaked with water; then spread over all about three inches of sharp pit sand, and make the whole firm and level. The back part of a span-roofed pit, running east and west, with a wall in the centre, is also a suitable place for the purpose. It should be filled to within a few inches of the glass with the same kind of material. In selecting the cuttings, tolerably weak wood of the present year's growth should be taken, if it is sufficiently ripened at the base or has made one full-formed leaf. Strip the cuttings with the finger and thumb, and smooth the base, reserving the detached portion of the parent bark; cut them close above the first leaf, and insert them in the sand, but not so thick as that their leaves will overlap one another. When this is finished, the bed should be watered, to settle the soil about them, and they should have plenty of air for the first four days; but it ought to be lessened by degrees, so as to gradually inure them to a confined atmosphere. As the preservation of their leaves in a healthy state is essential to success, the bed may be formed, and the cuttings put in on the same day, without waiting until the material becomes heated, as a thin covering of cellular tissue should be formed over the wounded end of the cutting before that takes place. In the third week the greater part will be rooted, and in the fourth they should be potted off into 60-sized pots, in a soil composed of leaf-mould and loam. They should be afterwards removed into a damp frame or pit, without any water being given to their roots; but they may be slightly syringed over their leaves, and when they become well rooted in the new soil, they may be hardened off and either shifted into larger sized pots or planted out in a sheltered border, where they will make fine plants for next year. By again levelling the surface of the beds, and making the cuttings to two eyes—always preserving one leaf, Tea-scented China, Noisette and Boursault Roses, &c., will root freely in it without any further preparation; but if a considerable quantity of the first-named sorts are required, either the old beds should be taken down, and a little fresh fermented dung added, or a new one should be made, using the same sort of materials as are recommended above. The young wood should be taken before the blooms are expanded, and the cuttings prepared similar to what I have already described. The young shoots of what is called the second growth, may also be used for cuttings; they should be taken when two full-formed leaves are made, smoothed at the base, and cut down to the first leaf, then planted in a bed of the same construction as above. When they are rooted they may be hardened off and allowed to remain in the bed until spring. Plenty of air in favourable weather should be admitted. In this way they will occupy less room than when placed in pots, and they will stand the winter better. Cuttings of Roses, like those of many other hard-wooded plants, are more certain of rooting when they are made short, especially if a healthy leaf is attached to them and kept there until they are rooted. This, however, can never be accomplished if the soil in which they are placed is subjected to the alternate action of wet and drought; but by placing wet leaf-mould between the dung and sand, an uninterrupted supply of

moisture is obtained, and no water is required, from the time the cuttings are put in until they are rooted in the pots. So suitable is this treatment, that when the bud at the axil of the leaf has been damaged, or otherwise abortive, those at the root are excited and suckers are produced. All kinds of Roses will root freely under this treatment. — *R. P. Drummond, Gwernant Park, Cardiganshire.*

A FLORIST REFORMER.—No. I.

THE TULIP.

THAT there is great occasion for a reform in Floriculture none will deny; but concerning the means by which this may be attained much difference of opinion will exist. Some may say that better regulations at florists' meetings will have a tendency to accomplish this desirable object; and also that by paying strict attention to the appointment of competent and impartial judges, something may be done. But the greatest evil is the selling, as well as exhibiting, one variety under several names, well knowing at the time that the plants are alike. It is astonishing that men, for the paltry sum of a few shillings will hazard their character and reputation in this respect. The dispersion of the late Mr. Clarke's Breeders has been a source of much confusion, each possessor upon breaking one having named it without taking the least trouble to ascertain whether the same variety was ever previously broken.

I have often been surprised that southern growers have not set about reforming this notorious abuse, possessing, as they do, the best means of doing so, as the Breeders were principally in their hands. If this had been the case we should not have had Polyphemus under so many names; and I must say that the parties who have again named it ought not to be classed (even if innocent) amongst those entitled to the highest rank amongst connoisseurs.

Much of this abuse might have been remedied if in catalogues annually published the synonymes had been given. I was the first who noticed in a catalogue the various names which the Tulip, as well as other florists' flowers, was sold under. Now, if this had been done by the southern florists, much inconvenience and mischief would have been avoided. I trust that they will now set about the matter in earnest, and in future, catalogue each variety under what is supposed to be the original name, adding after it the whole of the synonymes by which it is known. It is to aid this object that I give the following list of Tulips, with as many of the synonymes as I know; and if they are not correct I trust I shall meet with the cordial co-operation of good judges in effecting this object.

That the amateur may be benefited in making a judicious selection, I have classed them in three divisions. The First Class contains all that is worthy of a place in any stand of 12 or 24 varieties, and possesses every requisite of a fine Tulip. In the second the varieties have either fine forms, but tinged stamens, or else have rather long cups, and pure bottoms and stamens. Those in the Third Class are such as deserve a place in any collection, but are not calculated for a southern stage.

FIRST CLASS.

Aglaia
Amelia
Bacchus, *alias* Atlas and Rose Baccu
Carnuse de Craix
Catalina, *alias* Ponceau tres Blanc and Cerise Blanche
Cerise à belle forme
Galatea (Slater's)
Triomphe Royal, *alias* Heroine, La belle Nannette, and La Cherie
Madame Vestris, *alias* Clarke's Clio and Goldham's Princess Sophia of Gloucester
Ponceau tres blanc (Dutch)
Queen of Hearts (Franklin's)
Rose Brilliant.

Byblomens.

Anacreon (Slater's)

ENTOMOLOGY.

CURCULIO LINEATUS, of Linneus, (*the striped Pea-weevil.*)—There is no family of beetles more destructive to the produce of the garden than the Curculionidæ or Weevils, some attacking the Vines, Peaches, and Nectarines, others destroying nuts, seeds, and grain, and we have received from different quarters a species which is exceedingly injurious to the young Peas. This seems to be a favourable season for these beetles, for they made their appearance in thousands the last week of March, in the neighbourhood of Hertford, and for a fortnight caused very extensive mischief to the Peas; in some instances entirely eating off the second and third sowing, when the young plants had grown three or four inches above the surface. At that early period of the year they were observed to come out of the earth about nine or ten o'clock in the morning, and after feeding all day, they retired into the loose ground again as evening approached. At Stafford the same species of Weevil was equally troublesome, eating off the foliage of the early Peas, and it was not less destructive in the Isle of Wight, where it affected the Beans also.

The group to which the striped Pea-weevil belongs has been separated from the old Linnean genus Curculio, and has received from Germar the appellation of Sitona; it contains about 20 British species,* and the one before us is named Sitona Lineata (fig. 1); it is convex, and clothed with minute scales, more or less ochreous, those on the head and thorax often having a coppery lustre; they are also coarsely punctured; the head is elongated and narrowed before the eyes, which are black and not very prominent, and forms a short stout rostrum, at the extremity of which is the mouth, furnished with a pair of strong jaws, &c.; the face is concave, with a line down the centre; the antennæ are ferruginous, brightest at the base, very slender, not long, and inserted at the extremity of a groove on each side of the rostrum, towards the apex: they are geniculated or broken, and composed of 12 joints, the basal one long and clavate, the 2d larger than the six following, which are short, the remainder forming a spindle-shaped club of four indistinct joints; the thorax is cylindrical, with the sides slightly convex, the scales forming a dorsal and two lateral stripes; the scutel is minute; the elytra are long and elliptical, the shoulders prominent, there are ten punctured striæ on each, the spaces being alternately light and dark, forming five pale lines on each, in perfect specimens; but they are frequently partially obliterated, as in the figure: wings ample; legs moderately long, ferruginous; thighs stout and dark, but clothed with fine pale pubescence, and chesnut-coloured at the base; tibiæ simple; tarsi four-jointed, three first joints cushioned beneath; two basal ones elongate-obtrigonate, first the longest, third bilobed, fourth slender and clavate, claws small but strong. It varies greatly in size and colour, some being as long as the line in the cut, deep ochreous, with the stripes very distinct; whilst others are much smaller, and quite black and shining on the back, the scales being worn off.

* Curtis's Guide, Genus 375.

It is now thirty years since a friend showed me a bed of Peas in his garden in Norfolk, which was greatly injured by an allied species, called Sitona crinita by Olivier, which is the Curculio macularius of Marsham (fig. 2); it is very similar to the foregoing insect in size and figure, but as the colouring and markings are different, it will be as well to describe this Weevil:—It is of a gray tint, more or less ash-coloured; the sculpture and three pale lines on the thorax resemble those of S. lineata, but the elytra are spotted with black, some having a few spots only, as in the figure, others having the same spaces, especially the third from the suture, regularly spotted, and there are series of short bristly hairs down the centre of the furrows, particularly towards the apex; the legs are similar in colour to the other species, but the thighs are not so dark.

Before attempting to find a remedy, it will be necessary to ascertain the economy of these Weevils, and it is very remarkable, that although the Sitona lineata is found in myriads in Clover and Pea-fields, and is a constant inhabitant of the Broom and Furze, yet neither the science of the Naturalist nor the experience of the Agriculturist, has enabled them to detect when or where the eggs are deposited, or upon what the larvæ feed. In all probability, when these maggots are full grown, they retire into the earth, and there undergo their transformation into pupæ; yet I have some reason to believe that the Weevils hibernate and come forth in the early spring, cheered by the sun and impelled by hunger, to feed upon the tender crops; for the vernal specimens, as far as my observation extends, are always rubbed, so that they are much darker than the summer ones, and look like a different species. I should imagine that if soot were strewed tolerably thick along the rows of Peas, it would protect the crop from the ravages of the Weevils, and pulverised unslaked lime, it may be presumed, would be equally serviceable in dry weather. The best time for applying these remedies would be soon after sunrise, before the Weevils come forth to feed; and if any made their way through, they would not be able to return very readily, but in all probability would depart to more agreeable quarters, or would be rendered incapable of farther mischief during the night, for it may be inferred from their retiring into the earth in the evening that they suffer from cold. If the crop is watered, strew the soot or lime half an hour after, and let it lie at least half an inch thick on the surface. These Weevils drop, as nearly all the Curculionidæ do, when approached, and are consequently very difficult to find.—*Ruricola.*

THE ROSE-GARDEN.—No. XII.

(Continued from page 372.)

Failing Buds.—Failing buds should always be replaced with others, (but, be it remembered, that not one in ten ought to fail,) as near as possible to the place they were before entered, without mutilating the branch or body of the tree. Two buds in a tree are enough.

Untying the Ligatures.—This operation must mainly depend upon the weather; in general, during rainy weather, a month may elapse. If the weather be hot, six weeks will, perhaps, be scarcely enough; and sometimes it is a matter of indifference if the ligatures be removed or not until the spring. The object of the ligature, in the first instance, is to keep out air, sun, and wet; in the second, to keep the lips of the over-laying bark from turning up with the heat, and disuniting the wound which has barely healed; but care must be taken that in securing these advantages, the bark, swelling with the growth of the stem, is not confined, to the injury of the bud. To avoid this, as well as to secure the benefit of binding up, when you find the buds swelling, cut with the point of the knife, (taking care not to injure the bark,) that part of the ligature which is just behind the bud, leaving the bast on, which will continue to protect the bud from the sun, and three weeks afterwards remove the whole of the ligature. Or, untie the bast, and taking a broader piece, as not so likely to run into the dent created by the first, tie it on lightly to keep down the edges of the overlaying bark. It must be remembered, that injury is as frequently done by removing the ligature too soon, where the supply of sap has been deficient, as by leaving it on too long, where it has been profuse.

Shortening the Wild Branches.—At the end of Oct., or whenever the sap has quite deserted the stocks, but not before, it is desirable to shorten the wild branches, for two reasons; first, because it strengthens the tree against the frosts, &c.; and secondly, because it makes the garden a little less like a thicket. About 8 or 10 inches should be left upon each shoot, and care taken not to bend the branch too much on cutting it in, nor in any way to disturb the buds.

In nursery gardens, the shoots are frequently shortened while the sap is up, with the intention of making the placed buds push, as well as from a mistaken idea of strengthening the plant, by the removal of the very means of its nourishment, viz., the leaves. All such amputations from a healthy stock, where the root and branches are in proportion to each other, must be injurious; how much more so, then, when there is scarcely head enough to work the sap? The produce of the season should be left untouched until

autumn, and the circulation of the sap being unimpeded, the roots will continue to increase, and the stock to swell; and when the inserted buds receive the stimulus of the sap in the spring, the difference between their habit of growth and that of the natural produce of the wild stock (provided there be buds enough), is the only disadvantage the tree has to overcome that is worth a consideration. Knight mentions an experiment which he tried upon fruit-trees, of stopping the current of the sap by a ligature after the bud had taken, thus throwing a great part of the vigour of the tree into the newly-placed bud. This is a much more workmanlike experiment, and produces no injury to the tree. There seems to be an advantage gained by shortening the branches in the autumn, which at first sight might be disregarded, viz., preparing the plant to break out at the part desired. If a stock be entered in November, a preparation takes place in the buds at its summit, and they break in March or April, as may happen; but if the top of the same stock be left uncut till the spring, the plant is not prepared to break, and a delay occurs. Placed buds, not having so direct a communication with the channels of the sap as natural ones, require more management; and a very woody shoot that extends a considerable distance beyond the inserted bud, and has not been shortened in the autumn, is frequently induced, with great difficulty and repeated stopping of the sap-buds, to do the work required, viz., to transfer its sap; whereas, moderate cutting in applies the vigour of the plant throughout the winter to the vicinity of the part required; and the first blush of spring finds the inserted bud in a state of preparation to take up the action of the plant when the end of the shoot is cut away.

It will frequently be found that a plant which has been long worked, and carries a good head, will (when that head has ceased to increase for the autumn) employ the excess of the vigour of the plant in throwing out side shoots; it being manifest, in such case, that the head is not robbed by the formation of wood elsewhere, such side shoots may be left to increase with advantage; and if unremoved until their growth be fully terminated, they will help the stem to swell, and when cut off at the end of autumn, will transfer the vigour destined for their support to the supply of the head which remains the ensuing spring.

Home Correspondence.

Disease in Peach-trees.—I have noticed with pleasure the replies to "Omikron's" paper on the disease of his Peach-trees (p. 295), by Mr. Errington; as well as remarks that were given in a Leading Article lately. The generality of garden-walls in England, for the culture of choice and tender fruits, are very improperly constructed, being built what is termed solid walls—more especially in the south-east and west of England, it being well known that with few exceptions to the north of Nottinghamshire, we cannot bring the Peach, Nectarine, and Apricot, to the acme of perfection, without the aid of flued walls; not, however, for the purpose of committing an outrage, or forcing Nature against her will in early spring, but for protection through the blooming season, and more especially for assisting her in autumn, in better perfecting the wood to the well-being of the plant in the forthcoming year; without this being perfect, all science and labour will prove in vain. What a different appearance "Omikron's" trees would have presented had his walls been flued (for I presume that part of the country near Cheltenham will have fine open moist autumns), could he have given his wall a little fire through September and October, as it would in such a climate be quite practicable for one fire to have worked 40 yds. in length of a wall 12 ft. in height, on the split-flue system; or, 20 yds. each way, taking three runs in the wall. He would have been able to have more perfectly ripened the wood, and would not have met with the vexatious disappointment of which he so justly complains. I perfectly agree with the remarks in the Leading Article, viz., that the origin of the disease proceeds from the wood being imperfectly ripened (having had similar cases to contend with), and not, as Mr. Errington thinks, from the construction of the border, and the attack of aphides; for every practical man will have observed that the attack of insects generally proceeds, directly or indirectly, from diseased plants. It is the very reverse if plants are in health, and their wants properly attended to. It may be argued, that the expense of a flued wall is one great objection to its adoption; but that I oppose, as the saving in brick would nearly compensate for the extra expense incurred in pointing, flues, &c; two furnaces would manage 80 yds. in length, and in the course of 5 or 6 years, when the trees had covered the walls by judicious pruning and training, the furnaces might be dispensed with; the trees will have come into full bearing, and consequently will make more uniform wood, which would ripen in better season, having lost that superabundant growth which all young Peach-trees are subject to, especially in a well-formed and suitable border at a more early stage. Within the last 10 years I have erected a hollow wall in the gardens at Ashton Hall, which I think is a great desideratum, as well as a saving of expense, in Peach-walls where flued walls are not in use. Indeed, had I the erection of new walls, I should recommend my employer to adopt the hollow wall for the whole, whether flued for fire or not. The plan I adopted in the building of them is as follows:—After the foundation was put in upon a proper bottom I had it flagged, to start the brickwork or superstructure from; I then set out the wall 18 ins. wide, then run up a course of bricks, headers to each other, the width of the wall. Upon those I started three courses of stretchers lengthways to the face of the wall on each side, and one course up the centre, so that it leaves a vaccuum of $2\frac{1}{2}$ ins. betwixt the centre and outside courses. The wall was then risen five courses. In the following or sixth course one brick was bonded from either side the wall, meeting together upon the centre part; two bricks stretched and one headed the whole of this course, rising five courses when bonded and stretched as before, only the bonded bricks come in alternately with those below, so that they range diagonally within three courses of the top of the wall, above which is solid. This plan leaves an uninterrupted vacancy from bottom to top of the wall. In sunny weather, the vacancy becomes charged during the day with heated air, which is given back during the night, and materially assists in warding off our late spring frosts, and in perfecting the fruit and wood in autumn. From such a wall in "Omikron's" climate, there will be no fear of his wood becoming perfectly ripened; again, in winter, when the trees are at rest, it would, *vice versâ*, keep them cool and dry, to say nothing of such a wall being so much drier than a solid one. A wall put up on this principle is built at less expense, per superficial yard, than an 18 inch wall, independent of a saving of one brick in four; of course the workmanship of such a wall requires attention, *i. e.*, well bedding and flushing the joints. I agree with Mr. Errington, as respects the under-spit being of friable loam, on a bottom formed of cement, but disagree with his borders being composed of chopped turf: it might answer well for removing established trees into, but I am of opinion such a border would be too powerful for young trees. In a humid climate they would luxuriate too freely, which would cause them to grow too late in the autumn. Again, I am no advocate for over-cropping the borders, nor yet for narrow borders. In my opinion, if "Omikron" had procured his trees one or two seasons, preparatory to final planting, cut them well in, and had had them in training one or two years before removing them to their final destination—as there is generally spare room upon walls to give young trees a year or two's training,—their roots would have been in a better condition to support the top. As to the formation and depth of the border, and suitable compost, I should say, for a wall 12 feet high, a border should be 16 feet wide, and opened to the depth of 22 inches on a good sound bottom. It should have a fall from back to front of 16 inches upon the bottom, which should be well drained. Lay on, to the depth of 6 inches, well broken stones, filling in with the sward, and 4 inches of good strong loam, which should be previously laid up six months and never turned. This would, in my opinion, form a border for the growth and maturing of the Peach and Nectarine, adapted to the three kingdoms. Mr. Errington's remarks on dis-budding are very judicious, and his method of stopping the young wood, at the time the fruit is ripening, might answer for a tree that is fully established, but what effect would it have upon "Omikron's" trees, providing they were in good health? In a border composed of chopped turf, every strong shoot so stopt would throw out a host of laterals, which would have the appearance of a Ling broom. In healthy young trees they would almost break every eye. Would it not be a much better plan to curve the strongest shoots, so as to encourage the weaker parts of the tree? If "Omikron," by way of experiment—say early in September—would rear up a few spare lights from his early vinery, against two or three of his trees, covering the roots beyond their extremities with the same, he would, by ripening the wood more perfectly of those so experimented upon, I think be able next season to partially discover the cause of his present failure. There is likewise another cause of failure in the Peach, Nectarine, and Apricot, as regards their being subject to gumming, which is their not being worked upon perfectly free stocks. The more free-growing kinds, such as the French Mignonne, Royal George, and Noblesse Peaches, Violet Hative, and other Nectarines, worked upon stubborn stocks, dwarfs more so than standards. In a few years there are large excrescences at the point of union of the bud with the stock, so that in that time the trees have shown a premature decay. This arises from the want of reciprocity betwixt root and branch, and all the kind treatment imaginable cannot counteract the consequence. The sap in its downward direction meets a repulse, is propelled upwards into the channels already surcharged, when it procures for itself an outlet, and then gum disease, and a premature decay of the whole plant, is the consequence.—*James Roberts, Hampsthwaite, Ripley.*

Disease in Peaches.—Your Leader lately led me to refer to "Omikron's" letter; I know the case perfectly, having been annoyed for many years by the same disease, and not many miles from the same locality. You have hit the right nail on the head, as I can demonstrate. In addition to your theoretical hints, which are very judicious, I can give him some which have succeeded in practice. I would caution him against chopped turf, as I would a plethoric alderman against turtle, and recommend the water-gruel system. It is very uncommon to meet with good healthy Peach and Nectarine trees in this part of the country; I attributed this to want of care in providing them with suitable nourishment. Accordingly, I saved all the turf taken off about the eighth of an acre bared for buildings, and formed a border of this about 3 feet deep and 9 feet wide. My trees thrived beautifully to my inexperienced eye; I rejoiced in the size and vigour of the shoots, but my visions of melting Peaches were speedily dissipated by the plague which has visited "Omikron." I felt sure the soil could not be in fault, and concluded it must be our ungenial climate, for the enemy was especially active in the spring. The shoots were spotted, as if touched by the point of a red-hot skewer, with a crimson radiation over the bark from the centre, from which in most cases gum exuded. In my garden, the leaves and fruit were in many instances affected later in the season in the same way. To test my notion as to climate, I got a neighbour, who had a Peach-house, to take one of these trees, and to plant it in precisely the same soil in the Peach-house. There the tree flourished, and bore fruit abundantly, and not a spot was ever seen on it afterwards. I did not then see that the more perfect ripening of the wood was the explanation of the difference. I attributed this to protection from spring frost. Seeing, however, that the strong shoots were most affected, I set to work to check the growth by cutting away roots: that seemed to produce very little effect. I then loosened some of the smaller trees from the wall, lifted them, and re-planted immediately nearer the surface in the same soil. This produced a good effect. I obtained a larger quantity of fruit, and smaller wood. Then it occurred to me that the mischief resulted from the imperfect ripening of the large wood. I have since replanted my wall, and removed the bed of good soil where I planted the trees, and filled up the holes with stones, rubbish, and poor road-scrapings, nearly free from any mixture of dung. On this I laid about one foot of common garden soil, and placed my tree as nearly as may be on the level of the ground, and laid two or three inches of soil over the roots, so that, when eventually settled, the roots would lie a little under the surface. The trees are now looking better than I have ever seen them, with a fine crop of fruit, and generally free from all appearance of disease, though they still throw their wood somewhat stronger than I could wish. I do not dare adopt your suggestion, of taking out, early in the summer, all the wood which would not be requisite for the following year, which would certainly give that the best chance of ripening by free exposure; for the little which would be left would, in my garden, grow as large as faggot sticks.—*C. Lawrence, Cirencester.*

Preserving Seeds from Birds.—I have found it very difficult to keep birds from tree and other small seeds. Every nurseryman knows the uncertainty of depending upon boys, and the expense of nets, which are not always certain of preventing the seed from being injured. This season I adopted the following plan, which has succeeded remarkably well:—I had common hurdles, the same as are used for folding sheep, made the breadth of the seed-beds; they rest upon bricks on each side of the bed; so covered, no birds have got into them; but of those covered with nets, where there appeared to be no place of entrance, they made their way under the nets. Besides, hurdles form a shade that assists small seeds to get up. Would the same covering answer for quarters of Gooseberries, or Currants, by resting them on supporters higher than the bushes? Upon Raspberries, where shade is an advantage, they would not fail to answer. Birds have no inclination to go under hurdles, although they are open at all sides. Common coppice hurdles, 6 feet long and 3 wide, are worth from 6*s.* to 8*s.* per dozen.—*J. S.*

Bees and their Nightcaps.—"Melissa" requests to be informed how she may ascertain when her bees are napping, and the officers are relieving guard, for should she go when they are on duty, and the others wide awake, she fears she should have but a poor reception; besides, she has no Wrotham telescope to aid her vision, so that she is not likely to observe the working of the drones' eyes, the rolling and winking of which would altogether escape "Melissa's" notice. The habits of insects in many respects are worthy the imitation of man, and, as good examples of industry and short hours, she doubts not but Lord Ashley would most graciously receive an introduction to "Mel's" bees; but his Lordship would not recommend man to sleep away his spare time, but to work for that part of himself which we are told is never to die.

Bees.—Of late Mr. Pettigrew has written a great deal on these insects; and in my opinion, had he been nursed in a bee-hive he could not have thrown more light on the subject. A few weeks ago Mr. Pettigrew stated, by advertisement in the *Chronicle*, that he intended to make his peculiar system of management known for ten shillings, not pledging himself, however, unless he got 100 subscribers. Mr. Pettigrew mentions that it is worth ten pounds instead of ten shillings; and he was fair enough to say that if any person, after getting it, thought it too much, he would return their money. On seeing the advertisement, I was inclined to think it was quackery; but to be certain of the affair I wrote to Mr. Thomson, the gardener at Wrotham Park, whom I have known for a great number of years, and on whom I can place full confidence. Mr. Thomson in reply tells me that Mr. Pettigrew has made him a present of his system, and he confirms the advertisement to the very letter. I am, therefore, very anxious to get it, and I trust this will be the means of many coming forward, who at first, like myself, thought it a catch-penny; only 18 persons have come forward yet.—*J. Addison, Gosford, near Haddington.*

Glazing.—In reply to numerous inquiries I have received respecting my mode of glazing, which was lately described in the *Chronicle* (p. 277), I can only say, that I should not at all hesitate to have a house of any description whatever, glazed in the manner alluded to. Although I have never had an opportunity of trying it on a greenhouse or stove, I cannot see why it should not answer as well for these as for frames or pits, in which the angle is so much less than in the former. The principal thing is to have the work well done, making the edges of the panes fit exactly. If I were about building a new greenhouse, I would procure the glass a little thicker than what is generally sold for gardening purposes, as

good glass is made straighter and evener.—*J. L. Snow, Swinton Gardens.*

Root Excretions.—In a late No., "Dendrophilus" inquires, What becomes of inorganic matters, which plants are constantly taking up, and which do not appear to be essential to their healthy existence? He is undoubtedly wrong in assuming that there is no other explanation but "the theory of excretion by the roots;" but still, the question remains, What becomes of these superfluous inorganic matters? In many instances, when taken up in large quantities, they are deposited in the tissues of the plants so profusely as to obstruct the necessary functions for the life of the plant, and death is the consequence. Where these inorganic substances are not taken up in sufficient quantities to destroy the life of the plant, they are deposited in the tissues of the plant, either externally or internally or both, according to its structure. Plants growing on the sea-shore, as Salsola and others, when exposed to the absorption of large quantities of sea-water, deposit in great abundance crystals of chloride of sodium in their tissues and upon their epidermis. I have examined Charas growing in pools, where the waters, from the presence of carbonic acid, hold in solution great quantities of carbonate of lime, and I have found this salt filling their large intercellular cavities, and forming a crop of beautiful crystals on their epidermis, whilst those of the same species, growing in ponds, with a less quantity of carbonate of lime, have exhibited a comparative paucity of crystals. The colouring of wood, also, by introducing solutions of the metallic oxides into trees, is a good illustration of the mode in which superfluous inorganic matters are disposed of in the tissues of a plant. The point of practical importance in this question is to prevent, in the supplying of manures to plants, such a quantity of unnecessary inorganic matter entering their tissues as shall either destroy them at once, or render the processes of life less efficient. As an instance of how inorganic matters are got rid of by plants, I may mention that only a short time since, I had a substance almost as hard as iron placed in my hand to guess its source; it was a portion of the trunk of a decayed tree from New Holland, which I make no doubt had grown near a chalybeate spring, the inorganic contents of which, when taken into the tissues of the plant, had been deposited, and formed the hardened substance of which I saw a part.—*L. E.*

The Golden Pippin.—Among "Notices to Correspondents," in a late Number, I observe some remarks (but too true) upon the probable extinction in England of the Golden Pippin. I beg leave to mention that the Golden Pippin flourishes in the neighbourhood of Oporto, Portugal. Some years since, in the garden of a Quinta, upon the left bank of the Douro, belonging to a brother of the present Consul for Portugal, now resident in London, I counted a fine young plantation of Golden Pippin-trees, comprising at least 1000 strong plants. Now, it occurs to me that, for a renewal of the Golden Pippin in England, we might import a quantity of these plants from the vicinity of Oporto, by steam-vessels, at the proper season.—*B. D. Greys.*

Gooseberry Caterpillar.—In a late *Chronicle*, p. 372, are some remarks upon the caterpillar, which has this year proved so destructive to the foliage of Gooseberries and Currants. Mr. Walker is, however, wrong in considering it the larva of the Currant Moth (Abraxas Grossulariata); it does not belong to the order Lepidoptera, but is the larva of a hymenopterous insect—I believe Nematus Ribesii, of Mr. Stephens. Abraxas Grossulariata is a common species, but seldom sufficiently numerous to do any serious injury. The caterpillars of this species hatch in the autumn, remain torpid during winter, and feed again in spring. There are two or three broods of Nematus Ribesii in the course of the year. The correctness of my statement can easily be ascertained by preserving a few caterpillars in a box with a little earth.—*Henry Doubleday.*

Grafted Currants.—Standard Currants have a pretty appearance, and this is increased if they are grafted with opposite colours, such as black and white, white and red, or red and white. Allow the stock to reach four feet in height, then let it break two shoots, one of which is to be grafted with the desired variety; when this shoot has grown about six inches let both be stopped, so as to make a bushy compact head. For standards, or espaliers, train either horizontally, or by the fan method, about six shoots or more, according to the space you wish to cover, on either side, leaving one for the centre to be grafted. Train the same number of shoots of the worked variety. Each leading shoot, if kept well spurred in, will bear abundantly, and the fruit will also be of finer quality, and of a sweeter flavour, by being fully exposed to the sun and air, which is better attained by this method, than if the plants were grown in the usual way.—*J. R., Woolwich.*

Swans.—I beg to offer my testimony in favour of Mr. Forsyth's recommendation against the cruel disfiguring process of pinioning Swans. Of the cruelty there is no doubt; it classes with docking horses, dogs, &c, upon the strength of vulgar prejudice. If procured young, Swans, like many other birds, have strong local attachment. Who ever heard of pinioning pigeons or other birds, from choice?—from necessity there is no plea. Pinioned Swans having repeatedly perished from the attacks of dogs on the stream adjoining my premises, it occurred to me that it must be wrong to deprive this noble bird of any portion of its powerful means of defence and retreat. I therefore procured four years ago a pair of Swans in their second year, unmutilated; here they now remain far superior in appearance, and are now rearing their third brood. Last year, in spite of all danger from a well-frequented footpath on one side of the stream, they reared eight cygnets out of nine. I have known them, as your correspondent "Mr. Wighton" hints, "take the wings of the morning," but "evening shades" found them in their old quarters; this only occurs in very hard weather, when they soar away at a great elevation for a few hours occasionally. As a further proof of their attachment to locality, they invariably "nest" in my garden on the spot where they first turned down, though they have a mile in each direction for further choice. Some remarks have appeared in the *Chronicle* respecting the food of Swans. On a piece of water of 1½ acre in my garden, they make but little impression upon the aquatic weeds; but on smaller waters they must undoubtedly be of service in keeping down these plants. I have tempted them with fish of different species and sizes, but they invariably reject them; young frogs and toads they treat similarly; young Grass and aquatic plants appear to me to be their natural food, and of these they eat largely; if they destroy toads, it is in my opinion from the extreme jealousy they naturally have to companionship with any animal on the water, particularly in breeding time; even the cygnets of the former season should be removed early in the spring, for if they have not room on the stream to retreat to, their remaining on the spot would be fatal to them. The extreme grace of the Swan is its almost only recommendation, and with it a deep poetic feeling has been bound up for ages; and I beg of all who may wish to partially domesticate this bird, not to rob it of its great attribute.—*M., Deptford.*

Coniferæ.—The following is a memorandum of the Mexican Pines growing in the open garden here. They are planted on a high ridge of ground on the north side of the mansion, where there was for some years a mass of Scotch and Weymouth Pines, which grew remarkably well; they are now cleared from a part of the summit. The soil is a light sand, but has probably been enriched with the decayed leaves of the Fir for some years. Pinus pseudostrobus has been out two winters and is not injured; P. patula has been out one year, and is not the least injured; P. apulcensis has also been planted out one year, and is not at all injured; P. Ayacahuite was put out about the same time, and has already grown nine inches; P. Russelliana has been out for a similar period, and is not injured; P. Devoniana has been out one year, but the leaves have been injured; it is, however, breaking again and promises to recover; P. Hartwegii is not at all injured; P. macrophylla has been out one year, and is not in the least injured; P. tenuifolia was killed to the ground; P. filifolia was also killed to the ground, but is breaking from the bottom of the stem; P. Teocote was killed by the winter of 1842. I have planted out this season,—Pinus oocarpa, P. oocarpoides, P. leiophylla, and P. Montezumæ; likewise Pinus Caria, P. Gerardiana, P. pithyusa, P. Massoniana; Picea Pindrow, and P. Hudsoni.—*W. Scott, Bury Hill, near Dorking, Surrey.*

Humphreys's Compound.—In these days of deception it is due to those persons who send out a really good article, that those who benefit by it should make it known. A London seedsman some time ago sent me a bottle of Humphreys's Compound to try on our Pelargoniums. On looking over the directions, &c., I found it stated that a single bottle was equal to some hundredweight of rich compost, &c.; and, believing it to be an extravagant puff, I had very little faith in it. I, however, selected a large stock plant, which, from having been in a cold draught, had become very sickly and yellow. I gave it one teaspoonful of the compound, in a pint of soft water, and being certain that it had a marked effect, I gave it two more doses, allowing a week to elapse between each application. In three weeks it was by far the finest plant in the house. I then applied it to all the plants which showed any symptoms of turning yellow, and in a few days they were all a beautiful green. This was when they were in large bud. Since the dry weather has set in, being short of soft water, I have been obliged to use hard from the brook; this had caused a fine specimen of Enchantress to look much worse than it did a short time ago; in fact, a few of the lower leaves were very yellow; one of them was more than half bright yellow, and I imagined would have dropped off within the week. I procured a second bottle, and gave it one teaspoonful, my man remarking, with a laugh, that if it restored that leaf he should think it worth having; it is now ten days ago, and the plant is in flower. I have seen no effect upon the bloom, which was very good before, but the plant is now a beautiful green, and the above-mentioned leaf is now nearly as green as the rest. I observed the green gradually encroaching upon the yellow, till now there is only about the eighth of an inch left. I do not imagine that this manure will make up for the want of rich soil; but if it restores the green alone it will be very valuable. One plant of Sylph, to which it has been applied three times, is now in bloom, and I really think that it is finer in the flower than usual.—*J. R. Pearson, Chilwell Nurseries.*

Whitney's Composition.—I find that this composition upon wall-trees has the same effect as that described by "Rambler" and "Lignemont." I tried a frame of calico prepared with it upon a French Pear-tree, making the frame fit close to the wall at the top, and sloping it off so as to be about a foot from the wall at the bottom, for the free admission of air. While all the surrounding trees are covered with fruit, the one protected by the frame has set badly; its leaves being blistered and much eaten by caterpillars. I have also tried the prepared calico instead of glass for Cucumbers, and for striking cuttings under; for these purposes nothing can be better, and if it can be brought so as to be equally serviceable for wall-trees, it will be one of the most useful inventions of the age. I may also add, that when stretched upon light triangular frames, it forms the most complete protection to young Coniferæ, from having their branches broken by the weight of snow in winter.—*R. Davis, Millington.*

Toads and Snakes in Ireland.—At p. 357 of a late *Chronicle*, a correspondent, signing himself "J. Wighton," expresses the opinion that toads would live in Ireland, and that the experiment has not been carefully made. In this he is probably correct; but he does not appear to know that the natter-jack toad (*Bufo Calamita*, Laur.) is found in parts of the county of Kerry. This reptile proves to be far from uncommon in many parts of England, inhabiting sandy districts, where it has access to pits or bogs. It is a prettier animal than the toad, and far more active, running with considerable velocity when disturbed. I now come to the snake, which your correspondent says that wet boggy ground does not suit, and that, therefore, it would not, probably, flourish in Ireland. In answer to this, I need only say that the snake (*Natrix Torquata*) is very common in the fens of Cambridgeshire.—*C. C. B., Cambridge.*

Miscellaneous.—A *correspondent*, from Salt-hill, states that a plant of Statice pseudo Armeria was put out into the open border in Nov., 1843, and has stood the winter well. He adds, that it has three fine spikes of bloom, and that it appears perfectly hardy.

Societies.

LINNEAN SOCIETY.

June 4th.—The BISHOP of NORWICH in the chair.—Sir E. F. Bromhead, Bart., Arthur Henfrey, Esq., and Dr. Potter, were elected fellows.—Mr. Richard Taylor presented to the Museum a specimen of a fasciated branch of the common Ash-tree.—A continuation of Mr. Wood's paper on the arrangement of the European Carices was read.—A paper was read from Mr. Griffith of India, on the genus Sarcophyte. The description of this genus was given from a dried specimen which the author had received from Mr. Harvey. The plant has not a fungiform character, and abounds in a red colouring matter. Endlicher had previously described this genus; the author had not seen the membrane over the polleniferous masses described by Endlicher; the anther more nearly resembled that of Rafflesia than that of Balanophora; it resembled that of Rhizophora more nearly than either. The structure of the ovary presented many anomalies. The affinities of this genus on the whole are very doubtful. It had been placed in Cytineæ by Lindley; in Cynomoriaceæ by Endlicher; in Balanophoreæ; but it strongly differed from all, and its parasitism alone could not demand for it such a position. The author believed that the mass of affinities in the plant, pointed towards Urticaceæ.—Before adjourning the meeting, the President appointed Mr. Robert Brown, Sir W. Jackson Hooker, Mr. Edward Forster, and Dr. Horsfield, Vice-Presidents of the Society.—Messrs. Ross, Powell, and Varley, exhibited their microscopes.

ENTOMOLOGICAL SOCIETY.

Monday, June 3.—George Newport, Esq., President, in the chair.—A paper was read from Mr. F. Smith, on the Odynerus Antelope, a species of Hymenopterous insects. Drawings of its structure, with specimens of the perfect insect, its pupa, and of the species of Ichneumon which attacks it, were exhibited.—A paper was read from Mr. Waterhouse, on a new genus of the family Halticidæ, which Mr. Cuming had obtained in the Philippine Islands. The genus was named Notolissa, and three species were described. A new species of Blepharida was also described from the same island.—Mr. Thrupp exhibited a specimen of a Lime-tree, which had been attacked by a species of Coccus.—The President drew attention to a portion of the branch and leaves of an Orange-tree, which were covered with a species of Coccus. This was brought from the Azores, where the Orange-trees were suffering greatly from the attacks of this insect. Mr. Ivens, from the Azores, stated that the whole of the Orange-trees on one of the islands were attacked, and that where twelve thousand chests had been before exported, not a single chest had been sent away during the past year. This pest first appeared in this island three years ago, and had been supposed to have been introduced with some Mulberry-trees, which had been brought by the American Consul for the purpose of rearing silkworms. The Orange-trees on the island of St. Michael were now attacked, and the insect threatens, unless its ravages can be stopped, to do the work of extermination there, as effectually as at Fayal. The extent of the possible mischief may be judged of from the fact, that the Orange trade between that island and Great Britain constantly employs 200 sail of fast vessels, and pays a duty to the revenue of upwards of 50,000*l.* It appeared that the insect had been introduced to St. Michael's through the wreck of a vessel, which contained Oranges that had been grown on the first island. The insect attacked all parts of the tree, but the trunk in greatest abundance. It was found on the leaves, the blossoms, and the fruit. Many of the trees died as a consequence of the attack, whilst others languished, and bore fruit only partially. The old trees suffered most, but none of them escaped. Most of the trees on the islands were old trees, or trees produced from layers. Various plans had been tried to get rid of the pest, but in vain. In other countries where frosts occurred the insect perished,

but in the Azores there was not change enough of temperature to produce upon it any influence. The principal remedies hitherto applied had been sulphur, lime-water, and tobacco, but these had had little effect. The insect was supposed to be the Coccus hesperidum. These particulars were elicited through Mr. Ivens by the President and members of the Entomological Society, from Messrs. Vieira and Camara, two Portuguese gentlemen, who were present, and desirous of gaining information on the subject from the members of the Society. Mr. Spence stated that he had examined the insect, but did not think it the Coccus hesperidum, but from its exact resemblance to a muscle shell, a species identical with one he had a few years since observed attacking his Apple-trees in Yorkshire, and which he then ascertained to be the Coccus arborum linearis of Geoffroy. With regard to the mode of exterminating it, he feared that the hardness of the scale of the insect would prevent any effectual application of poisonous solutions without injuring the tree. He believed the most effectual way, provided labour was cheap, would be to clear off the insects from the entire tree with the hand. If this could not be done, the trunks of the trees and principal branches might be scrubbed with a brush, so as to remove or injure the insect. The President said that Dr. Cowan had recommended naphtha, but he feared this would injure the tree. He had heard that an infusion of Chamomile flowers had been used with success in killing the Coccus on plants in the greenhouses of this country. This would be perhaps expensive for Orange groves, but he would propose that an infusion of Quassia should be used. This wood was now to be had in almost any quantity, and an infusion of it might be applied to the under surface of the leaves by means of a small engine, in almost any quantity. Dr. Lankester suggested that the attack of the insect might depend on the debilitated state of the trees from age, as it appeared that no new plants had been recently raised on the islands from seed, the trees from the layers being only parts of the old trees; and if this was the case little could be expected from remedies, but the best means of getting rid of the pest would be to grow new trees from seed. Mr. Wright thought the application of manure might have some influence in restoring the trees to a state of health in which they would no longer be exposed to the attacks of the insect. Mr. Camara stated that the Apple-trees and Pepper-plants on the islands were also attacked, but that the greatest destruction was in the Orange-trees. Mr. Spence, in conclusion, proposed that a committee of members of the Entomological Society should be formed, for the purpose of making further inquiries on the subject, through Messrs. Ivens, Camara, and Vieira.—*L. E.*

MICROSCOPICAL SOCIETY.

May 15.—Thomas Bell, Esq., President, in the Chair.—Mr. Bowerbank exhibited specimens of a Conferva, growing between the lenses of an achromatic object-glass. The plant appeared to be composed of tubes, in which, at irregular intervals, were a number of sporulean bodies. In some places the sporules touched each other, exhibiting a moniliform appearance. Some object-glasses, pasted over with paper, also exhibited the same appearances. Mr. Bowerbank also exhibited specimens of the larvæ of an Ephemeris, in which the action of the circulatory organs could be seen when placed under the microscope.—Mr. J. Quekett noticed the iridescent appearance which glass frequently exhibited after having been buried for some time in the earth. This he ascribed to the decomposition of the surface of the glass, and which by this means is split up into a number of fine lines, which gives rise to the reflection of the various coloured rays of the spectrum.—Mr. Edwin Quekett made some observations on the raphides found in plants. These bodies were sometimes constant, as in the testa of the seed of the Elm, where they are found in the same position in all specimens. He was of opinion that these crystalline bodies were useful as contributing elements for the nutrition of future generations of plants. They were generally composed of oxalate of lime, a substance that contained both carbon and oxygen, and existed in some plants to the amount of 80 per cent. of their bulk.

COUNTRY SHOWS.

Gardeners' Benevolent Institution, June 11.—The Exhibition in aid of the funds of this institution took place in the grounds of the Bishop of Rochester, at Bromley, in Kent. The day being fine, a considerable number of plants were gathered together, and the place was tolerably well filled with company. The principal features of the Show were two collections of 50 plants, from Mr. Barnes, gr. to W. Norman, Esq., and Mr. Hunt, gr. to Miss Traill. That of the former contained the greatest number of well-grown specimens; but, as many of these, as well as some of those in Mr. Hunt's group, were shown at Regent's Park, we shall only notice the plants that were not present on that occasion. Loudon's "Arboretum Britannicum," given by Mr. Charlewood, of Covent-garden, was awarded to Mr. Barnes's collection, in which was a fine plant of Oncidium luridum, a noble Ixora coccinea, a beautiful Aphelexis humilis covered with blossoms, and other plants equally well managed. Mr. Hunt got a second prize for a slightly inferior group. Collections of 12 Stove and Greenhouse Plants were sent from the gardens of E. Goodheart, Esq.; F. Perkins, Esq.; H. Beaufoy, Esq.; and Sir C. Farnaby, Bart. In the first of these, which was the best, was a beautiful dwarf specimen of Polygala acuminata, a large Pimelea hispida, 2 healthy plants of P. decussata, and a pretty Azalea variegata. The best group of 24 Stove and Greenhouse Plants was contributed by Mr. Pawley, who had a large well-cultivated Euphorbia splendens, a Cereus, named laterritius, which was something like Jenkinsoni, but was paler; a pretty Gloxinia rubra, a large Russelia juncea, and several Heaths, among which was a small E. densa, with fine dark-green foliage, that contrasted well with the small white blossoms. A 2d Prize for 24 was awarded to C. R. Cutler, Esq.—Mr. Hanley, gr. to H. Berens, Esq., sent 6 Stove and Greenhouse Plants, for which he obtained the 1st Prize. Among these was a pretty Achimenes rosea, and a beautiful Leschenaultia formosa was particularly noticeable. A 2d Prize was awarded to Mr. Wilson, among whose plants was an Æschnanthus ramosus growing on a block, and trained over a wire trellis; it was in good health, and by this mode of training finely displayed its deep orange blossoms. Some Orchidaceæ were present, but among them there was nothing novel. Messrs. Henderson, of Pine-apple-place, sent a good Epidendrum Stamfordianum, and a pretty Broughtonia sanguinea. Others were from Mr. Barnes and G. F. Cox, Esq., of Stockwell; the latter contributed the beautiful Cattleya intermedia, Oncidium Wentworthianum, in good condition, and Aerides affine, producing a pretty raceme of purple blossoms. Among these was also a good Stanhopea tigrina. Pelargoniums, in collections of 12, were shown by Mr. Gaines, of Battersea, Messrs. Hendersons, and by other growers. Mr. Gaines got the 1st prize, for Rising Sun, Caroline, Grand Duke, Coronation, Lady Isabella Douglas, Emperor, Comte de Paris, Una, Kinghornii, Erectum, Juba, and Albina, the latter a most beautiful large specimen. Messrs. Henderson were 2d; other groups were very much inferior to these. The 1st prize for 12 Calceolarias was awarded to Mr. Barnes, for Sovereign, Priory Queen, Standishii, Lady of the Lake, Zenobia, Master Walter, Pride of Kent, Prince, Delicata, Mabel, and Emily; 2, Messrs. Henderson, of Pine-apple-place. Of Heaths the best group was sent by E. Goodheart, Esq.; in this, as well as in collections from other growers, were some large well-cultivated specimens, but as they were nearly all shown at Regent's Park, they are fully noticed in the report of that exhibition. Of Fuchsias, Mr. Cole produced good plants of Champion, Victoria, Venus Victrix, Insignis, Brockmannii; Gem, Curtisii, Stanwellii, Eclipse, Paragon, and Britannia; other collections, in equally good condition, also graced the tents. An extra prize was given to E. Lawford, Esq., for 12 plants of Achimenes longiflora. Cut Roses were shown by Mr. Paul, of Cheshunt, and others; nor were Pansies wanting, but as no names were attached to any of the stands, we decline noticing them further. In the fruit tent we observed some black Hamburgh Grapes, 2 Melons, and a few Strawberries.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LÆLIA SUPERBIENS. Stately Lælia. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—The admirers of Orchidaceæ have to thank the Horticultural Society of London for many of the most splendid plants of the tribe which they possess, and especially among those of South American origin. The beautiful family of Cattleya, and its kindred genus Lælia, have been greatly augmented by the industry and zeal of their collector, Mr. Hartweg, who gathered and sent over to the Society a great number of species, and amongst them the present. As it was forwarded in considerable quantity, it has found its way into many collections. Mr. Skinner has also the merit of having introduced it very extensively. Till the present season, however, its flowers have only been known in this country through dried specimens, and the plates given in Mr. Bateman's superb work on Guatemalan Orchidaceæ. About the latter end of February last, however, a fine specimen grown by Mr. Brewster, gardener to Mrs. Wray, of Oakfield, near Cheltenham, was exhibited at the rooms of the Horticultural Society. Another specimen, but less perfect, has since flowered in the Society's gardens. We learn from Mr. Bateman's work, just alluded to, that it is found growing out of the crevices of the rocks in the cooler districts of Guatemala, chiefly in places which are sheltered from the keenness of the northern winds. In such situations, the pseudo-bulbs sometimes grow twenty-two inches high, and have flower-scapes four yards long, crowned with upwards of twenty flowers. This immense size, however, is far from being common; and when the plants are not protected on the north side, they are very small, and have an imperfect stunted appearance. In England the flower-stems have been about six feet in length, and the pseudo-bulbs usually rise about a foot. Probably the reason why flowers have not been produced sooner, may be correctly assigned to the fact of the specimens which were first introduced having been subjected to a high temperature, with a close, moist atmosphere. These conditions being more favourable to luxuriant growth, would undoubtedly militate against the production of flowers. And it was not till the plants which have bloomed were treated in a contrary manner, that they displayed any appearance of flower. Cattleyas and Lælias should always be grown in a lower temperature than is required by East Indian genera; and, during their winter season, water should be carefully withheld, and no moisture allowed in the house that can be prevented.—*Paxton's Magazine of Botany.*

Garden Memoranda.

A. Rowland, Esq.'s, Rosenthal, Lewisham.—This residence is well worthy of the name Rosenthal, or the Villa of Roses, being decorated on every side with a profusion of that beautiful flower. The principal entrance to the garden is from the drawing-room, and looking from which down the main walk, we are struck with the magnificent arches of Roses that meet the view; on these the large pink blossoms of the Bengale florida, contrasted with the purple Noisette, have a happy effect. On entering the garden, the rich and varied colours of this first of flowers beset us on all sides; but perhaps the principal object is a small temple on the left of the main walk, covered with Roses, which overtop a circular basin in which is a fountain tastefully decorated with shells. When this is set in action, it imparts a lively appearance to the scene. Many of the Roses are of the first order, and we were informed by Mr. Rowland, that he never had them in better condition, which is a remarkable fact, when we consider the long period of dry weather we have had; they are, however, regularly watered and syringed every evening as soon as the sun is off them, which may possibly account for their superiority. Some choice kinds are also protected from the sun and rain by canopies composed of canvas, spread over circular frames of wirework, from the circumference of which extend across at right angles two other wires, bowed upwards and forming a convex roof, which excludes wet and preserves the colour of the flowers for a considerable length of time. The principal walk leading from the house is terminated by a small piece of water, in which a fountain is continually playing. On the right of this miniature lake is a grotto, built of Derbyshire spar, from which a pleasing view of the grounds can be obtained. Leading from this grotto is a walk, agreeably shaded by an avenue of trees, which terminates in a Rose Garden, the extent of which is about two acres. This is chiefly planted with Crimson Perpetual, Cabbage, and Provins varieties, which, considering the dry season, were in very good bloom. In a collection of Roses that are cultivated in pots we observed Devoniensis, in fine condition, as well as Victoire modeste, which is a beautiful blush, together with Lady Fitzharris, a fine lilac, which contrasted well with the white blossoms of Lady Campbell, that was dwarf and healthy. Throughout the whole Garden we saw no appearance of green-fly; the Roses were all in the most perfect health, and bore ample evidence of care and good management.

Miscellaneous.

Abstract of Meteorological Observations, by JOSEPH MILLIGAN, Esq., at the Van Diemen's Land Company's Establishment, Hampshire Hills. Lat. S. 41° 18'; Long. E. 145° 55'. Elevation above the Sea Level, 1340 feet.

—*From the Tasmanian Journal.*

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

BESIDES the daily routine of watering, shading, giving air, and training the plants, with an occasional shift to some more promising specimen, there is little else to be remarked on just now. The great fault in almost all plant houses is being too full of plants, and consequently the plants injure one another; but as a number of stove plants are much benefited by a change into some of the cooler houses, this house never need be injuriously crowded in summer.

Conservatory.—Of all the great families of conservatory plants, the Chinese Azalea has made the most rapid improvement in size, shape, and colours, and being among the easiest to force in early spring, we may have some sort or other of them in flower for this house from the end of January to this time. In ordering them from the nurseries, amateurs who are not well versed in the cultivation of plants, should order "worked plants," while some gardeners prefer them on their own roots, in order to keep them dwarf for particular situations, &c.; but they are much easier managed when grafted on the Præcinicea, or some strong seedlings from it, and this is a good time to graft them. The best six kinds that I saw in London, and which approached nearest to a florist's fancy, were Triumphans, Magnifica, Eximia, Alba superb, Apollo, and Speciosissima; these are also all cheap plants—the dearest of them may be had for five shillings. Ne plus Ultra, Refulgens, Concinna, Præstantissima, and Exquisita, are still finer kinds, but higher in price, and rather scarce in some of the nurseries. I would strongly recommend, when young plants of these fine Azaleas are bought in, that they should be turned into a bed of sandy peat in a turf-pit, or common cold frame, for the next three or four months; they can always be removed with safety into pots.

Forcing-pits.—The young stock of Gardenias, with all the novelties recently propagated, are the chief occupants here; and now begins the propagation, by grafting, of Camellias, Rhododendrons, and Azaleas: where expedition is preferred, these may be kept in a strong, moist, and close heat till they are united, but they will do perfectly well in a close cold frame, well shaded, only they take longer time in this way.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out door Department.—We have been accustomed to complain of bad seasons for flower gardening for years past, but I am not aware that we had ever so much real "ground for grumbling" as in the present one. Plants cannot grow except in very favourable situations, and we have not had any rain worth notice for nearly three months past, and watering, except for the purpose of keeping plants alive, is almost a waste of time, for we have here used, for days together, nearly 100 tons of water, without, in three days afterwards, being able to perceive where it had been used, and I am daily more and more convinced of the inutility of watering, or of expecting growth from its application, except in dull cloudy weather. Out-door gardening at the present time is very disheartening, and the business of the week may be summed up in a few words, viz.—"Do all you can to keep the plants alive until we get rain."

American Garden.—Except where the plants are mulched they must receive a thorough deluging of water, by forming basins round them, and afterwards covering the wet ground with dry soil, or some kind of mulching. They are dying in Kent by hundreds, and, I suppose, in other parts they are scarcely more flourishing.

Rosery.—Those who have Roses in pots may now use them advantageously for budding, and on the Tea and Chinese varieties will obtain a growth, and probably a flower, in the autumn. If, as Mr. Rivers says, roasted turf is a good thing for pot Roses, there will not be much difficulty, at the present time, in laying in a stock of it ready roasted.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Auricula and *Polyanthus* seed will now be getting ripe; as soon as the capsules assume a brown colour, and give indications of opening, they must be gathered; dry them well, and put them in small tin boxes, as recommended in an early Number of this year's *Chronicle*. *Tulips.*—Put a glass shade over the seed-vessels which are intended to be saved, to prevent the wet lodging in the apex. Those bulbs the leaves of which have suffered from canker, or have sustained injury from early frost, may be taken up, as they are apt to mildew if allowed to remain in the ground too long. *Ranunculuses.*—Carefully shade those intended for exhibition. Semi-doubles, for impregnation, must not be covered, as the sun and air are essential in the process of fecundation. Water the paths about the beds, so as to make the surrounding atmosphere as moist as possible. Wetting the foliage at this season, especially with spring or hard water, is rather detrimental than otherwise. *Carnations.*—Continue to tie with soft worsted; examine those previously fastened, and mind that the "tie" is sufficiently loose on the stick to allow the stem to elongate. Thin out the buds, the crown or topmost bud usually produces the largest and best bloom. If the plant is strong, reserve five; on the contrary, three is sufficient if the plant is weak. *Pinks* are generally not lacing well this season. Piping must be kept regularly moist, and well protected from the direct rays of the sun. *Pansies.*—Continue to put in cuttings, and pursue the method as recommended above for

Pinks. Good varieties are now so plentiful that inferior sorts ought not now to be tolerated in any garden whatever.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—Let plants now swelling their fruit be liberally supplied with liquid manure. Destroy all superfluous gills and suckers as they appear, retaining no more suckers on any plant than can have room to grow strong. Continue to encourage the recently-pott.d plants to re-establish themselves, by keeping them shaded during hot weather, and maintaining a moist atmosphere. Any ripe fruit requiring to be preserved for a week or two, should be removed, plant and all, to a cool room. Close the houses early in the afternoon, and no fire will be required. By this treatment the plants will also be healthier.

Vineries.—Where the Vine-borders are well drained they will now require a plentiful supply of water. Avoid syringing the fruit after it is half swelled. Keep a moist atmosphere, and stop the laterals, except a few at the top of each Vine, which should be left to prevent the starting of the principal buds. The litter may now be quite removed from the borders where the Vines have ripened their crops, except about two inches of the rottenest of it, which should be left to serve as a mulching, and to keep the ground from cracking with the drought.

Peach houses.—Syringe daily the trees from which the crop has been gathered, and supply them with plenty of water at the roots. The sashes may now remain constantly open. Continue to tie in the shoots in late houses, and stir the surface of the borders before giving them water, which must now be often done. Trees in pots which have been forced should be placed in a sheltered place, and plunged to the rim in old tan or ashes: they must have plenty of water, and be frequently washed by means of the garden-engine.

Fig-house.—Keep the shoots thin and regularly tied in, that the fruit may have sufficient exposure to the light. Pinch the young lateral shoots above the third joint. Give plenty of air and water, and syringe daily.

Melons.—Do not let the heat in the beds fall below 80° or 85°, as it is very injurious to the plants; and if water is given in that state it is apt to cause canker. Let the coverings at night be continued throughout the season.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Fruit-trees and Shrubs.—Proceed with thinning, nailing, and tying in of young shoots. There will be a fair crop of Apricots and Peaches in most places this season. Guard against leaving too much fruit and too many shoots. Let the sad havoc among Peach-trees in Feb., 1843, be a warning to us, neither to exhaust the tree by over-cropping, nor to allow more wood to remain than can be properly ripened. In unfavourable situations, after seeing that the borders are not suffering from drought, keep them clean and smoothly raked near the wall, or cover them to the width of a yard with tiles; the reflection of heat from the tiles, and keeping the border rather dry, will insure the earlier maturation of the wood; but in adopting such a course, the roots of the trees must not be soaked with rains in autumn, or all your extra labour will be worse than thrown away. *Asparagus and Sea-kale.*—Fork up the ground of the beds, give them a dressing of rotted manure, a moderate sprinkling of salt repeated at intervals, and a good watering of drainings from the dung-hill, if you can afford it, and your beds are not in a damp situation. The latter vegetable I kept till lately in very fine condition, by covering it thickly with wasted manure, which kept it nice and cool.

Sow succession of herbs, such as *Chervil, Basil, Purslane, Parsley*, &c. It is a good plan to sow plenty of the latter in a quarter of Gooseberries or Currants, as it will be found useful in February and March, when to be scarce of Parsley is to be placed in a very awkward predicament: it may be dug down when all danger of scarcity is over. Sow also *Turnips* and *Radishes* for succession; the last crops of garden Beans, Marrow Peas, Scarlet Runners, and French Beans, for succession. One crop of the latter might last all the season, if the ground were well manured, the plants supplied with water, and no pods allowed to get large for seed. *Plant* out herbs, such as *Basil, Marjoram*, &c., in a warm situation; Cabbages, Savoys, Scotch Kale, Brussels Sprouts, &c.; Celery into trenches, and also in beds for future removal, shading the latter, and covering all the others with inverted flower-pots during the day in this scorching weather. Routine—Protect Cherries and Strawberries from birds by netting; thin Carrots, Turnips, Onions, and water Strawberries, fruit-tree borders, Cauliflowers, &c.; and if, like myself, you have not yet obtained a good soaking rain, you may learn a lesson on watering, by observing the effect produced on your lawn by a slight shower, followed by bright sunshine.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—It would be of great advantage to appoint some person accustomed to such work to go through these during the summer months, in order to keep young plants or trees in brakes or rough places from being injured by the overgrowth of the side branches of other trees, shrubs, brambles, &c.

Coppice.—The same advice is also necessary for coppices. These ought to be regularly attended to, if profit is expected.

Young Plantations.—The summer pruning, training, &c., of these should be annually attended to. This is the practice of Dr. Thackeray, whose success in the management of woods has been so often noticed; and in whose mode of management I entirely agree. I am at present busily engaged in such operations, in a recently made plantation. Persons unaccustomed to such work often cut away the very trees, or plants, that ought to stand, and that could easily be reclaimed by a little judicious management: I have ample proof of that here. It is disgraceful to see the manner of thinning, pruning, and training, that is almost universally practised.

Nursery Work.—Attend regularly and constantly to summer training of young plants in this department, and accelerate their growth as much as possible. Plant out "for good;" it is surprising that this operation should be neglected.—*W. B.*

State of the Weather near London for the week ending June 13, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 21st 1834—therm. 91°; and the lowest on the 22nd, 1830, and 20th, 1842—therm. 39°.

Notices to Correspondents.

Beech-grafting.—*A Subscriber.*—If you would succeed in this, you must take scions from the two-year-old wood (one-year-old is useless), and graft exactly as if you were propagating Apple-trees, except that you must earth up the stocks above the clay balls, so as to leave only the least bud of the scion above the ground.

Books.—*Renfrewshire.*—Probably Tower's "Domestic Gardeners' Manual" may answer your purpose. Also Bevan on the "Honey Bee."——*D. S.*—We know nothing of books on the Linnæan system, which is out of use except among children; and it is no compliment to the intelligence of a child to give it such books.——*Claudiocestrensis.*—The best book for a gardener to study, who would understand the principles of his vocation, is the "Theory of Horticulture." The others you name are far too technical for him.——*W. Sadler.*—Bevan on the "Honey Bee."

Climbing Plants.—*J. A.*—You cannot have better climbers than Kennedya Marryattæ, Hardenbergia macrophylla and monophylla, Dolichos lignosus, Mandevilla suaveolens, Clematis azurea grandiflora, and Bignonia Pandoræ.‡

Covering for Frames.—*A Subscriber, &c.*—The following is the mode of preparing the composition described by "Devoniensis" at page 301, 1843. "Three pints of old pale linseed-oil, one ounce of sugar of lead, and four ounces of white resin. The sugar of lead must be ground with a small quantity of the oil, and added to the remainder, incorporated with the resin by means of gentle heat. The composition is to be laid on by a brush, after the calico is nailed to the frames. One coat annually is sufficient. It dries in a short time when exposed to the air; and excludes as little light and heat as anything, except glass, and does not become mildewed."‡

Cuttings.—*A. A. A.*—Nothing is better than silver-sand for striking cuttings in. If you use charcoal it must be a very soft sort, and should be mixed with half its bulk of good soil. Geraniums will keep very well throughout the winter in any soil, if frost and damp are kept away.——*A. Y. L.*—Wrap your cuttings in damp brown paper, and then encase them in two or three folds of tinfoil, securely turned in at the ends. This is the safest way of sending them, unless you prefer employing a tin box instead of tinfoil.

Diseases.—*Vitis.*—Your leaves were in high health; and in all probability the appearance of disease is owing to want of sufficient ventilation.—*C. K.*—No one has explained the cause of the loss of whole limbs in Apricots suddenly; but it is possibly owing to the same causes as those which have ruined "Omikron's" Peach-trees (see p. 33, 1844). The disease in Apricots is but too well known. Mr. Andrew Knight thought it was owing to the want of motion in the branches, by reason of which sap was able to accumulate and stagnate; but we doubt the justice of that view.

Grasses.—*R. G.*—Nothing thrives *well* under trees; the best Grasses for the purpose are Poa trivalis and nemoralis, especially the evergreen sort; Agrostis vulgaris, Lotus corniculatus, Cynosurus cristatus, Phleum pratense, and Milium effusum. Festuca elatior, and Aisa cæspitosa, will grow in those places, but their herbage is coarse.

Heaths.—*A Lady.*—These may now be placed out of doors There is no objection to setting them inside of a Melon-frame, provided it is taken off the dung-bed and placed in a cool situation. The lights should be kept off as much as possible, as Heaths are very impatient of confinement, and some sifted cinders should be spread inside the frame for the plants to stand on. Wherever they are placed they should be partially shaded, as the burning sun of July and August, with the succeeding heavy dews, has the effect of depriving the plants of their foliage; on the contrary, however, they must not be wholly deprived of the sun, for that would tend to encourage mildew; they must be watered with soft water.‡

Heating.—*A Young Beginner.*—The cheapest of all means of heating a small greenhouse are flues; the best are hot-water pipes. If you merely want to exclude frost, and live in South Wales, the former will do well enough.——*Clodhopper.*—It is generally admitted now, that it is an advantage to have large pipes, containing a considerable quantity of hot water. But 4-inch pipes are large enough; others are needlessly expensive. The tank system is of great use for Pine-houses; but it will not do alone. You must have pipes to heat the air as well as tanks to give bottom-heat. We never recommend tradesmen. The more bones you have for your Vine border the better. Lime is a good ingredient, but unnecessary when bones are used abundantly.

Insects.—*M. Saul.*—Thanks for your specimens: we only wish you had sent more, that we might breed them, for we cannot tell you what the Wheat grubs are, and those transmitted to the Royal Agricultural Society were dead and dried up. *R.*——*B. Chilo.*—The most useful work for young persons is "Samouelle's Entomologist's Compendium," and for those more advanced, "Westwood's Classification" will be of service. If your insects had been numbered, and you had kept corresponding specimens, or rough sketches and descriptions, we could have given you their names if desirable. The insects in quills are the pupa of a Reduvius and Œdemera cœrulea, Curt. Guide Gen., p. 4276, vol. ii. *R.*——*X. Y.*—We must breed the insects infesting the Apple buds before we can tell you the name. The green-looking Caterpillars produce moths called Halia vanaria and Hybernia brumata, whose histories you will find in the 1st vol. of this Journal, pp. 516 and 812, with the best means of destroying their larva. *R.*——*F. W. Crick* will find both his Woodlice described and figured at p. 356. *R.*——*Lusor's* larva feeding on the Aphides is unknown, but it will change to some dipterous fly. *R.*——*A Subscriber*—As your box was broken and without a lid, the jumping insects had all escaped; you had better secure some in a quill. *R.*——*A Constant Reader.*—It is an Aphis which is destroying your Cucumber and Melon plants. Fumigation or sponging the leaves with tobacco-water will eradicate them. *R.*——*E. S. T.*—We cannot tell you the cause of the metallic hue on the leaves of the Plum-trees, but we have no reason to think that it is produced by insects. *R.*——*Claudiocestrensis.*—The best remedy we know for Aphides is gas-water (see p. 545, 1843), but it has a very offensive smell, and so have all volatile matters likely to destroy them. You might, however, try the fumes of smelling-salts. The grand difficulty is to kill animal life without that of the vegetable.

Lawns.—*C. R.*—Nothing will restore your Grass-plat to verdure except water. When rain comes give it a top-dressing of Potter's guano, at the rate of 2 cwt. per acre. If you can soak the ground with water even now, the Grass will again grow, provided it was in good condition before the drought set in.——*M. D.*—Heavy rains will put your lawn to rights, and nothing else will. It is useless to apply manures in dry weather. Cow-dung is the best manure for Rhododendrons.

Manure.—*Hounslow.*—Collect the chamberley with all diligence, add as much water to it, and let it become putrid; then pour it on a compost heap, in order to have it soaked up; or the cinder-siftings of the house may be employed for the same purpose; or you may employ it at once; or if you wish to keep it in a fluid state after fermenting, add gently oil of vitriol till it ceases to effervesce. In its fluid state it is best applied to growing crops, provided it has become putrid. ——*A Scottish Agr. Subs.*—The analysis of guano is too difficult to be undertaken by any except chemical analysts. Hellebore-powder is recommended at p. 365, 1842. It must be fresh ground and pure if it is to act.

Names of Plants.—*Tyro.*—1, Agathæa cœlestis; 2, Hibbertia grossularifolia; 3, Callistachys lanceolata.——*A Tradesman.*—Reseda alba, not Mignionette.——*W. S. G.*—Leptospermum tuberculatum. The tinfoil-wrapper guarded it perfectly.——*Newland.*—Your Hornbeam is the variety called the "Cut leaved." It is well known.——*Pomona.*—Your Apple-tree and Rose are overrun by some sort of parasitical fungus, apparently a Botrytis. Lime-water is most likely to kill it; but it is not likely to disappear until wet weather sets in.——*Cavanensis.*—Your Madeira Evergreen is some sort of Laurus: the fruit will not give any further information. It may be hardy in Ireland. Your statement about Potter's guano having been used advantageously in all cases, save one, suggests that the exception was owing to some other cause. Any strong manure will suit a Vine-border. There is nothing better than coarsely ground bones.——*H. I.*—Genista sibirica; it is frequently raised from Himalayan seeds, and is only a tall variety of G. tinctoria.¶——*H. T.*—Rondeletia odorata.——*A Subscriber.*—Centaurea solstitialis (?)

Pelargoniums.—*W. D.*—The mode of cultivation employed by Mr. Catleugh and Mr. Cock is given fully in our columns for 1841, pages 83 and 100. We, however, cannot think the system of growing huge specimens worthy of being followed.

Roses.—*Querist.*—We shall furnish you immediately with the means of propagating Roses. Fern indicates ill-cultivated land; destroy its leaves incessantly, and it perishes. Clip furze hedges at midsummer; cut them down in the spring when about to start.——*J. S. I.*—If your Roses are growing very luxuriantly let them alone, unless you prefer to stop them so as to get lateral shoots. If you will read "The Rose Garden" with attention, you will get, in time, full information upon all such points. We do not understand how a Lemon-tree can grow so luxuriantly as to fall about the tub. Oranges and Lemons always grow with stiff branches.

Miscellaneous.—*Upstart.*—The object of growing Cucumbers in troughs is not to improve their quality, but their form. Opinions are so divided about bee-hives, that you are not at all likely to get a satisfactory answer to your inquiry. Wooden boxes, made with *very stout* boards and *well*, and well managed, are probably the best. Put salt on Asparagus-beds now, and let the rain wash it into the ground. We will consider whether anything can be added to the instructions already given in forming Asparagus-beds. At all events, this is not the season for the operation.——*A Subscriber.*—We cannot answer your question. We never recommend tradesmen.——*P. T. O.*—We know of no means of reducing mica to powder except by pounding. Finger-pruning signifies pruning by the finger and thumb, and not by a knife, and, of course, therefore requires to be performed when the wood is young and soft. The manner of bottling unripe Gooseberries, &c., has been stated at p. 821 of 1842. We presume that the common painters' varnish is what you want: but your question has no relation to *rural economy.*——*Fidget.*—We certainly misunderstood your first communication: but the very circumstance you mention of other newspapers giving Horticultural retrospects would prevent our attempting it. No doubt they are prepared by the editors, with much care and trouble, and often by clever men; and what are they good for? In our opinion absolutely nothing.——*H. F.* will find much information respecting Vegetable Ivory at p. 836, 1842.‡

SEEDLING FLORISTS' FLOWERS.

Cactus.—*W. M. and Co.*—It is impossible to form a satisfactory opinion of your Cactus after it has closed, so much of its beauty and worth depends upon the free manner of its expanding; and this point we cannot ascertain from a closed specimen.*

Calceolarias.—*I. B.*—No. 1 is decidedly your best seedling; it is a good shape, and the blotches are handsome; 3 is good in colour, but fails in form; 4, common; 12, no use, run colour; 19, 23, 26, 27, are too indented at the bottom; Gem is common and Zebrina too indented; 2 is a pretty variety.*——*Calceolus.*—Your specimens are large and bold flowers. No. 2 is the best—good form and decided blotch; 3, good form, with blotch too broken; 4, wants shape; 5, common and too indented at the bottom; No. 1 we could not find.*—*J. Salter.*—The flowers generally are very much smaller than those cultivated in this country; the largest specimen is the size of those commonly grown in England. A few of the spotted varieties are pretty, but this class has received so much improvement during the last two seasons, that both size and beauty are required to make them acceptable. The flowers in this collection are generally deficient, both in size and form.*

Cinerarias.—*S. W.*—Your seedling reached us in so dried a state, that it is impossible to give an opinion upon its qualities.*

Fuchsias.—*T. L.*—Your seedling Fuchsia is delicate and pretty; but a variety has lately been exhibited, similar in colour, with larger flowers and smaller foliage.*——*T. S.*—It is the habit of your seedling that will make it acceptable; you describe it as drooping; the flowers are pretty and brilliant in colour.*——*G. S.*—If your seedling *Celestina* produces eight flowers at every joint it must be a most prolific bloomer; the flowers bear some resemblance to *Exoniensis*; but they are not so large, nor is the corolla so high coloured.*—*O. R.*—Your three seedlings are alike in colour, though differing somewhat in form; they are stout and handsome, but they bear too strong a resemblance to other varieties cultivated; we could not determine whether the sepals expand well, or whether they were sleepy: much depends on this.*

Gloxinias.—*Rio.*—Your four seedlings very much resemble each other, but none of them appear to be sufficiently distinct from varieties already known. It would be advisable in future to pack your flowers in wet Moss; they travel very well in this material, whereas your specimens were much bruised and dry, and could not be seen to advantage.*

Pansies.—*O. B.*—Your seedling wants form, substance, and a decided eye.*—*J. L. H.*—14, 15, 17, are well-formed flowers of good substance, and the marking very precise; their fault is being too small; these are worth trying again under more favourable circumstances; 13 is too poor in colour; 16 is tolerably good, but not pretty—the eye occupies too large a space.*——*S. T.*—Your seedling wants substance; it is inferior to most of the light selfs.*——*O. R.*—The ground colour of both your darker seedlings is imperfect, and the yellow self is quite second-rate.*——*G. R.*—Your seedling is a large stout flower, imperfect in the ground colour of the side petals, and having the upper petals rather too large.*

Pelargoniums.—*I. M.*—The lower petals are too long in Fleur de Marie, and there is nothing in the flower to distinguish it from many others.*——*C. J. B.*—12 seedlings. Most of these seedlings are common in colour, and deficient in form, the lower petals being too long, and causing a division (when the flower is fully expanded) between the upper and lower petals, which destroys the fine cupped form a good flower should possess. This is the case with 1, 2, 3, 6, 7, 8, 11, 12. 10 is rather better, but common in colour, and too much feather seen at the base of the upper petals. No. 4 is fine in colour, and the best-formed flower in the collection; but the petals curl back too much, and one of the upper petals entirely hides the spot on the other. 7 is good in colour; 9 too coarse and veiny; and 5 wants substance.*——*O. B.*—There is a defect common to all your seedlings—the want of form; they are all long-petalled flowers, and when fully expanded there is a greater division between the upper and lower petals than is consistent with compactness of form; they are common in colour with two exceptions, and these burn very much.*——*I. P.*—There is nothing in your seedling to distinguish it from many others; the petals were all loose, and the lower ones are too long for a well-formed flower.*

Petunias.—*I. W.*—The surface of your seedling was so much injured by the way in which the flowers were sent, that a satisfactory opinion cannot be formed; if the change of colour is decided it will prove an acquisition, but this we cannot judge of from the state of the specimens sent.*

AGRICULTURAL COLLEGE, &c.—At a MEETING of the COMMITTEE, held the 3d of JUNE, 1844, Earl BATHURST in the Chair,—3d Resolution—"In consequence of the Committee being now in a situation to report very favourably as regards the site for the College and Farm; also as to obtaining a Royal Charter limiting responsibility of shareholders; it is necessary that a General Meeting should be called at the earliest period."

In pursuance of the above Resolution a Meeting of the Shareholders and others interested in the establishment of this Institution is appointed to be held at the King's Head, Cirencester, on Monday, the 1st of July next, at 2 o'clock.

By direction of the Committee,

Cirencester, 4th June, 1844. ROBT. J. BROWN, Hon. Sec.

The Agricultural Gazette.

SATURDAY, JUNE 15, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 19 Agricultural Society of England.
THURSDAY, June 20 Agricultural Imp. Soc. of Ireland.

WEDNESDAY, June 26 Agricultural Society of England.
THURSDAY, June 27 Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

June 24 { Chepstow. Wenlock. Fairford. W. Firle.
June 25 { Framlingham. Rayleigh.
June 27 { Richmondshire. Grove Ferry.
June 28 { Stoke Ferry. Hadleigh. Wrentham. Debenham.
June 29 { Cardiff. Gloucester.

WHEN a London Broker sells substances requiring CHEMICAL ANALYSIS, he has such an examination made at his own expense, and when he offers them for sale he produces the analysis for the guidance of buyers, who regulate their offers by the declared extent of impurity in the samples. Suppose, for example, the substance is nitrate of soda, and that it is worth, if quite pure, 20*s.* per 100 lbs. When the analysis is produced, it may appear that the sample contains 10 per cent. of impurities of one kind or other; the nature of these is declared; the buyer then considers how much it is worth his while to give, and regulates his bidding accordingly. Why cannot farmers compel the venders of their artificial manures to produce authenticated analyses in like manner?

If the buyers of guano, nitrate of soda, bone-dust, oil of vitriol, sulphate of ammonia, and such things, were to form an ANTI-FRAUD League, they might do themselves quite as much good as by means of other leagues now so much in fashion; and if they would hold together steadily, they would soon put an end to the roguery that is so successfully practised upon them. It would not be enough, however, to insist upon seeing an analysis before buying articles capable of adulteration; for there would still be room for cheats to thrive in. What farmers should do in addition would be to put aside a pound of the substance in a glass bottle; to securely cork and seal it up, so that it might eventually become evidence against the seller; if crops fail, or suspicion is aroused, to have it formally analysed; and then, if it turned out to be different from the analysis on the faith of which it was bought, to proceed at law against the seller. We will leave the worthy gentlemen who sell loam for guano, and limestone or chalk for bone-dust or bone-ash, to picture to themselves what sort of damages a jury of farmers would give in such a case. Once caught, they would not like to repeat the experiment.

We regard analysis, in some way or other, as an indispensable precaution in making purchases of artificial manure of all kinds. Respectable dealers cannot object to it, and wise purchasers will insist upon it. Bills of lading, certificates from captains of merchantmen, and all such devices offer no guarantee whatever of purity; analysis does, and analysis only. For example, there was sold last week by auction in London, a large quantity of imported guano. The customary analysis indicated from 60 to 70 per cent. of impurity. The whole lot was bought at from 30*s.* to 50*s.* per ton, and, no doubt, will go into the country as guano *genuine as imported*. For this stuff, containing 30 per cent. of water and 30 per cent. of sand, simple people will pay perhaps 10*l.* a ton nominally, while the real price paid will be 30*l.* a ton; and yet it will be genuine as imported. No man acquainted with trade would pay the least attention to any other thing than analysis. Guano is not the better for coming from Africa or Peru, for those countries have plenty of the substance of no value whatever. Its goodness depends not upon its foreign origin, but upon its actual chemical condition; and nothing but analysis can show that.

THE valuable articles by Mr. Gyde, ON BLACK HORSEPONDS, which have appeared during the last three or four Numbers of this Paper, and the results of the experiments detailed by Mr. Bree in his series of papers on the Application of Chemistry to Agriculture, must surely have convinced those of our readers who suffer the liquid manure of their farmyards to run to waste, of the great loss they sustain in doing so.

There are two modes of applying this manure to the land: it may be carried to the field in a water-cart, and spread during the growth of the plant, in a diluted state; or, if before the seed is sown, in a concentrated state; and if the land be harrowed or cultivated and rolled immediately, no great loss by evaporation will ensue; or, as this involves considerable labour, it may be applied on the land by soaking the dung-heap with it, and thus carrying it to the fields in the ordinary farm-yard manure. This latter plan is preferred by Mr. Hannam, author of the excellent work on Waste Manures, to which we have already referred. The following are remarks by him on details connected with the carrying of this system of management into execution:—

"Let all the buildings round the farm-yard and strawfolds be spouted, and the delivering tubes so arranged that the water may be made to flow into the yard or not, at the option of the farmer. This may be effected by bringing the end of the spout over a drain, which may be left open or closed, as he may wish the water to escape from the yard or not. Let the farm-yard, if possible, be made slightly concave, so that the liquid may permeate the mass, and make to the centre. Make drains from every stable, cow-shed, &c., and from the kitchen into the manure yard. Select a shady place, if possible on the north side of a hedge or wall, where it is convenient to cart the manure to, when it is removed during winter and spring from the fold. Mark out a surface sufficiently large to hold in a heap all the manure made during winter, and form a compost couch of this size, and two feet deep. Divide this couch into three sections, by two rows of flags or bricks. Make the bottom of each couch incline, so that liquid from the manure may gradually fall to the front side. Next cut a drain alongside, and in front of the couch, with an inlet from each division, through which the liquid may flow into the drain, and fix a sluice at each inlet. Make a capacious tank on any convenient side of the couch, and connect it with the drain which runs alongside the couch, so that the liquid from the couch may run into the tank. Make a drain from the bottom of the farm-yard into the tank, and fix a sluice, so that the liquid from the yard may be let into the tank or not, at pleasure. Fix a pump over the tank, and connect the nozzle with a wooden spout, placed so as to traverse above each division of the couch. Bore a hole through the spout over each section of the couch; in each hole put a plug, on the top side of the spout. Also, over each hole affix on the under side of the spout a leathern nozzle or delivering tube, two or three feet long; by means of which arrangements, the liquid from the tank may be directed to any part of the couch."

The following woodcut represents an arrangement something similar to this:—

A, A, are platforms on which the future compost heap is built; they sink, as represented by the arrows, towards the tanks B, B, into which any soakage from the manure naturally falls, and into which the liquid manure from the stables and feeding-stalls is also conveyed, along the covered drain, *d*, *d*. c is the position of a well and pump connecting with these tanks; the water is by this means conveyed back again over the manure in the heaps as often as may be desired. It would have been better, perhaps, if the tanks (B) had been in the centres of the platforms (A)—these sloping in a basin-shaped manner—instead of being placed at the ends of each; and the pump (c) might then have been in the centre of the whole heap, between the two tanks. The liquid from the stables, &c., might have been conveyed underground just as represented in the figure, and there would thus have been less difficulty in spreading it evenly over the whole heap.

The shed at the side, represented in the figure, is in a convenient position for holding the tools required in the management of the manure—in turning it, &c.; and it is also intended to shelter the materials to be used in fixing the ammonia evolved during the putrefaction of the manure, both liquid and solid. Either gypsum or sulphuric acid may be used for this purpose; the former should be occasionally spread in layers over the dung-heap, the latter should be poured directly into the tank. In Mr. Bree's experiments, 1 lb. of sulphuric acid was required for every two gallons of urine; from this it may easily be calculated how much gypsum would be required for the same purpose, in the event of a complete decomposition taking place, this earth being a compound of sulphuric acid and lime.

ON THE CULTURE OF THE TURNIP.

(*Continued from page* 321.)

HAVING been unavoidably hindered from continuing my remarks on this subject till now, when they are in a measure unseasonable, I shall not enter into that detail upon the proper mode of preparing the land for this crop, and of applying manure for it, which I should have laid before your readers had I been able to send you this paper a fortnight earlier, so as to have it published before the seed-time of the Swedish Turnip. I may, however, just mention two or three points, which I think ought to be impressed on the mind of the farmer, and which, moreover, will serve to render these notes more complete than they otherwise would be.

The opinions you have frequently expressed, and quoted from Mr. Waterton's "Essay on Alkali," as to its being the farmer's interest to use manure so that it may be all available as food for plants the same year that it is applied, while I am ready to adopt it in so far as it is expressive generally of the impropriety of allowing farmers' capital to lie uselessly dormant longer than can be helped, must nevertheless in certain instances in which it might be applied, be taken with some grains of exception. Thus, I should be sorry to suppose, after having harvested my corn crop in autumn, that I had fairly exhausted the land of all the tillage that was in it, and that all my chance of a green crop succeeding it, must depend on the immediate application of additional food for plants. Though in any case such an application is necessary, yet, in my opinion, it is right to make the crop of Swedes depend as much on the general fertility of the land, owing to *previous* good cultivation, as on the excellence or quantity of the manure ploughed under in the year of its growth. The quantity of the crop would probably be as great, and its quality much better, where it draws its nourishment from the stores of a fertile soil, than where it has to partake of the crude and fresh materials of the manure just ploughed in. For a similar reason, and in order to give that uniform fertility to land on which the excellence of a green crop, no less than the evenness of a sample of grain, depends, it is, I think, better to apply the greater part of the manure broadcast to the land, as soon as it has been reduced to a sufficient tilth, ploughing it in, and harrowing, and rolling, and then ridging or drilling up at the proper interval, say 26 to 30 inches, for the seed. This ridging may be done by half a bout of the plough, or a mere ribbing of the land, corresponding to what in some districts is termed raftering. The rest of the manure may then be laid between the drills, in the ordinary way, in order especially to give the young plant a vigorous start through the host of foes which belabour it in the first stages of its growth. The mode of applying this manure has, I think, been already described in this Journal. Where but a small quantity is to be applied, say 10 or 15 yards per acre, two men filling carts at the dunghill will, in a field of ordinary length, keep two ploughs opening drills to receive manure, and splitting them again to cover it, and they will keep four boys spreading the dung which is drawn from the cart into every third drill, as the horse at an ordinary pace walks up it. One of these boys makes a rough division of the manure, as he finds it, amongst the three drills, and the other three walking behind him spread it evenly in each. The two ploughs work round and round them, opening fresh drills on one side, as they keep gaining on the field, and splitting them on the other, as the intervals between them are successively filled with manure. The sowing machine and the roller keep up close behind, so that the whole operation is completed at once.

When artificial manure, or guano, or superphosphate of lime is being used, I have generally applied it by a sowing-machine, mixing it with 20 or 30 bushels of old turf-ashes, in the drills, in the same place as I would otherwise have drilled in the ordinary farm-yard manure; and generally, in order to mix it well with the soil before splitting the drills and covering it, I have stirred it well into the soil with the horse-hoe. With regard to the usefulness of these manures, I quite agree with the Editor of the *Dublin Farmers' Gazette* in a remark in a late Paper, that the concentrated manures are valuable chiefly *as a means of creating farm-yard manure*, which will ever prove the farmer's sheet-anchor.

With regard to the quantity of seed to be sown per acre, I quite agree with Mr. Poppy in the expediency of adopting that principle in reference to the fly, which landlords and farmers should adopt towards one another, viz., "Live and let live;" and the only way of carrying out that principle is to sow such a quantity of seed as, supposing them all to vegetate, shall leave a sufficient plant on the ground, though the fly should attack them in crowds. Accordingly, this year, on nearly 30 acres for Swedes and Turnips, I have sown about 1½ cwt. of seed. This, it appears, from the following article communicated by "P. M." to the *Dublin Farmers' Gazette*, is not an extraordinary quantity:—

"*Cultivation of Turnips.*—In sowing for Swedes at the beginning of May I have given 6 lbs. and 7 lbs. to the imperial acre, without being too thick for insuring a healthy, rapid growth of the young plants, and thereby

setting the fly at defiance. The time at which they are attacked is just after the seed has expended its strength, when they are apt to make a stand, particularly if the weather be ungenial or the ground about them unkindly, and the longer they remain stationary the insects have just so much longer time to prey upon them ; the object, therefore, is to keep them growing, and get them into the broad leaf as quickly as possible ; and the most certain method of effecting this is, to have a close braird, as young plants grow vigorously for a certain time when thick together. It is not at all surprising that people should have occasion to complain of the fly destroying their young Turnips, when they allow only 1½ lbs. or 2 lbs. to the acre, and that, it may be, sown broadcast or in rows on the plain ground, 12 or 14 inches apart; I only wonder at the mercy of the flies in leaving them any at all. It will be observed that 3 lbs. to the acre, sown on drills or ridglets 28 inches wide, will give exactly four times as much to each row as 1½lbs. to the acre, with 14 inches between the rows. Now, no man of common sense would expect a braird thick enough to withstand the attacks of the fly by sowing drills 28 inches wide, at the rate of ¾ lb. to the acre, which would be the same to each as 1½ lbs. with the rows 14 inches apart. I sow all in drills about 28 inches wide, with the manure, whatever it may be, directly under the seed ; and the very least I allow in the finest soil, and under the most favourable circumstances, is 3 lbs. to the acre, and I never suffer by the fly. Last season, owing to the heavy rains that prevailed in May, the ground was rather stale and unkindly for the seed, and I just expected a slow growth of the young plants, and its concomitant, a formidable array of flies. The land I had for Swedes was a sandy loam—exactly that kind of soil which requires the least quantity of seed, but, though previously well prepared, owing to the state it was in at the time of sowing, and the appearance of the weather, I considered it advisable to allow between 4 and 5 lbs. to the acre. I was, of course, laughed at by my neighbours for "throwing away" so much seed ; but in a few weeks I was amply compensated by a full growth of healthy young Swedes, while they had a few half-eaten, sickly-looking plants, standing from each other at the most respectful distance. I could scarcely be blamed for laughing at them in return. It may be worth mentioning, that when beginning to sow, something more than half an acre was gone over before I discovered that the machine was depositing considerably less seed than I had ordered, when I had it immediately altered. The flies were over the whole field, but the damage done was not appreciable, except on the part thin sown, which narrowly escaped being completely destroyed, and remained inferior throughout : except that, notwithstanding the complaints of last season, I had not a single failure from the effects of the fly on nearly 30 acres of Swedes ; and the common Turnips, sown at a later date, were equally unhurt."—*John Morton, Whitfield, Thornbury.*

ON MINERAL AND INORGANIC MANURES.

No. XVIII.

BY PROFESSOR CHARLES SPRENGEL.

(*Continued from p 363.*)

h. Marl from Brunswick (stony, yellow, red and green striped). 100,000 parts consist of

71,096	parts	silica
3,978	,,	alumina
6,477	,,	oxide and protoxide of iron
1,080	,,	oxide of manganese
13,385	,,	carbonate of lime
2,604	,,	carbonate of magnesia
0,005	,,	gypsum
1,200	,,	phosphate of lime
0,015	,,	common salt
0,160	,,	potash and soda, combined with silica

100,000 parts.

Although this sort of marl has been used but very recently on loamy soils (500 cubic feet per Magdeburg acre), it has been already recognised as very superior. Exposed to the air during the winter, it will fall to pieces pretty easily, still it does not yield such a fine powder as the earthy marl of alluvial soils, inasmuch as all stony marls take several years to be converted into earth and soil. It acts (as might be expected) best on those soils which are deficient in lime, magnesia, and phosphoric acid. Used in the above quantity, it will not improve the soil mechanically, as it contains too little alumina, and is not clayey enough.

i. Marl from the subsoil of the marshes of the Weser (in its dry state powdery). 100,000 parts consist of

78,910	parts	silica and very fine quartz sand
3,123	,,	alumina
3,800	,,	oxide and protoxide of iron
0,330	,,	oxide of manganese
8,189	,,	carbonate of lime
2,950	,,	carbonate of magnesia
1,230	,,	phosphate of lime
0,490	,,	gypsum
0,080	,,	common salt
0,360	,,	potash combined with silica
0,547	,,	soda ditto

100,000 parts.

As this marl contains a few marine shells, and is to be found not far from the seacoast, we may assume that the sea-water has much contributed toward its formation. It is much used in the marshes as a manure, inasmuch as it is taken from the ditches, made to a certain depth for the sake of draining, and then conveyed on the moors, which are very rich in humus. The effect of this operation is very great, which is easily explained by the marshy soil obtaining thereby not only much silica and lime, but also all other mineral substances required for crops. The moors, which have hitherto yielded only Oats, after the manuring with this marl, produce the finest Rape, Wheat, &c. The quantity spread on one acre is 100,000 lbs., in which case the soil will receive the different mineral substances just in the proportion mentioned in the above analysis. It is obvious that it will improve the soil for many years to come.

k. Marl from the subsoil of the Elbe marshes (in its dry state powdery and of a gray colour.) 100,000 parts consist of

84,507	parts	silica and very fine quartz sand
2,795	,,	alumina (partly united with humic acid)
2,568	,,	oxide and protoxide of iron
1,240	,,	oxide of manganese
4,252	,,	carbonate of lime (partly also humate of lime)
2,762	,,	carbonate of magnesia
0,005	,,	phosphate of lime
0,249	,,	gypsum
0,050	,,	common salt
0,120	,,	potash united with silica
0,320	,,	organic remains rich in nitrogen
1,110	,,	humic acid
0,022	,,	coal of humus

100,000 parts.

This marl, which also partly owes its origin to marine shells, is often used in the marshes of the Lower Elbe as manure, where it is called Kuhl, or Wühl-erde. It is dug out of large holes, made on the field itself at a great expense, and then spread over the surface 2 to 3 inches thick, so much so, that about 200,000 lbs. are brought on the acre,—double the amount of the quantities mentioned in the analysis. The soil is improved by this marl for many years; because, poor as it is in phosphate of lime, there is plenty of it in the marshy soil, as I have found by analysis. Wheat, winter Barley, Rape, Oats, and Beans will grow after it most abundantly; Rape, for instance, will yield at times 2200 lbs. of seed per acre, whilst Oats will often bear 2400 lbs. of grain on the same area. But the soil requires to be ploughed to the depth of 18 inches, and manured every 6 or 7 years with 60,000 to 70,000 lbs. of fat dung, without which, such extraordinary harvests would be impossible.

Burnt Marl.—The effect of marl is much improved by burning, but this burning ought rather to consist in a sort of roasting, because if marl was to be burnt like lime, the lime would combine with the silica into a silicate insoluble either in water, or carbonic or humic acid, which would be very disadvantageous. The merely roasting of marl, on the other hand, causes the silicates of potash and soda which may be contained in it to be loosened, which will render them more easy of being decomposed by the carbonic or humic acid. It will also cause ammonia to be formed through the decomposition of water by the oxide and protoxide of manganese. The roasting will also be of use, by changing some of the carbonate of lime into caustic lime. If it be applied soon after roasting, under the ground, it will strongly attack the coal of humus and the vegetable matter in the soil, decomposing them, and if it contains much clay, it will act like burnt clay. As the latter is best when it contains much iron (as we shall see presently), we may assume that roasted clayey marl also will be best when it is rich in iron. By roasted clayey marl, stiff clayey soils may be improved mechanically, because, as its argillaceous parts lose by burning the property of mortaring with water, and will not form tough paste with it, roasted marl will, like coarse sand, keep a clayey soil loose. The roasting of marl is done like that of clay.

ON BLACK HORSEPONDS.—No. VI.

THE animals that are allowed to drink of these polluted waters, are exposed to the action of poisonous matter in three distinct forms ; namely, putrefying organic matters and inorganic corrosive matters, both taken into the stomach, and poisonous exhalations of a deadly character, inspired by the lungs. We have seen, in the last paper on this subject, that when putrefying organic matters are either received into the animal system, through the stomach, or taken into the circulation by the absorbents on the surface of the body, disease of a formidable and often fatal character is produced, and that irritating and corrosive substances, when received into the body, destroy life, by producing inflammation and disorganisation of the parts with which they come in contact.

We have also seen that an imperial gallon of water, taken from one of the black ponds at which the horses of a neighbouring farmer were allowed to drink, contained no less than one hundred and sixty-eight grains of, 1st., putrefying animal and vegetable matter, held in solution by the solvent action of ammonia on organic matters ; and 2nd, of potash, soda, ammonia, lime, sulphuric acid, phosphoric acid and chlorine, the saline constituents, in fact, of putrefying animal excrements, holding in solution a large quantity of animal and vegetable matter in a highly putrescent state.

Now it is well known that water, holding even a very small quantity of animal and vegetable matter in a state of decomposition, in solution, acts injuriously on the animal frame, producing dysentery of a very distressing character ; even the small quantities mixed with the river water below London, 30 gallons of which, according to Dr. Lamb, contain 28 grains of carbonaceous matter, produces most injurious effects on our sailors, when used in a state of putrefaction, and, until it has completed its fermentation, when it deposits a slimy matter, and is then fit to use. The beneficial effects derived from care as to the qualities of water, says Mr. Chadwick, are now proved in the navy, where fatal dysentery formerly prevailed to an immense extent, in consequence of the impure and putrid state of the supplies, and care is now generally taken on this subject by the medical officers of the navy.

Dr. Pereira, in his valuable work "On Food and Diet," relates a case tried at the Nottingham assizes in July, 1836, where it was proved on the trial, that dysentery, in an aggravated form, was caused in cattle by the use of water contaminated with putrescent vegetable matter, produced by the refuse of a starch manufactory. The fish (perch, gudgeon, pike, &c.) and frogs, in the pond through which the brook ran, were destroyed. All the animals (cows, calves, and horses) which drank of this water became seriously ill, and in eight years the plaintiff lost 24 cows and 9 calves, all of dysentery, accompanied by nearly the same symptoms. It was also shown that the animals sometimes refused to drink the water—that the mortality was in proportion to the quantity of starch made at different times—and that subsequently, when the putrescent matter was not allowed to pass into the brook, but was conveyed to a river at some distance, the fish and frogs began to return, and the mortality ceased among the cattle. The symptoms of illness among the cows were as follows :—The animals at first got thin, had a rough staring coat, and gave less milk (from two to three quarts less every day) ; then they became purged, passed blood with the fæces, and at length died emaciated and exhausted. On a post-mortem examination, the intestinal canal throughout its whole length was found inflamed and ulcerated. The water when examined was found loaded with putrescent vegetable matter, and contained chloride of calcium.

Now the symptoms here described, with little exception, were precisely those shown in an instance which has come under my own notice, of three valuable cart-horses that died in a short period, belonging to the owner of the horsepond, the analysis of the water of which I have given above. The first appearance of disease showed itself in the coat of the horses becoming rough and staring out, diarrhœa supervened, and after a time symptoms of inflammation of the bowels set in, which soon destroyed the animals. On a post-mortem examination of two of the three by a veterinary surgeon, extensive inflammation of the mucous membrane of the stomach and bowels was discovered. After the loss of the third horse, the farmer suspected the pool to contain the source of disease, and ordered his horses fresh water, after which all appearance of disease disappeared.

In the case related by Dr. Pereira, as well as that in which the contents of the horse-pool produced such injurious effects, much is to be attributed to the deleterious action of the decomposing nitrogenous matters contained in the water ; since it is well known that the most deadly organic poisons contain nitrogen as one of their elements.

In the manufacture of starch, after the first portion of starch is separated by washing, the water in which it has been washed, and which contains the vegetable albumen, gum, and sugar of the grain in solution, is allowed to putrefy, when a fresh portion of starch is deposited ; the water is then of no farther value, and is run off as refuse, carrying in solution the putrefying nitrogenous and other vegetable matters of which the cows drank.

In the case of the horsepond, besides the nitrogenous and vegetable matter, in a state of putrefaction, obtained from the urine and fæces, and the decaying straw in the yard, we have a powerfully-irritating poison in the salts of ammonia, acting in conjunction with the organic poison, and tending to bring about a more rapid state of inflammatory action in the mucous membranes. When we consider the state of the black horsepond, can it be a matter of surprise that three horses died from drinking at it ; since, if each horse drank 5 gallons of water every 24 hours, it must have received into its system, in the water alone, no less than 840 grains of soluble matter every day, of a highly poisonous tendency, or 51 lbs. annually ? Alas, for the health of the animals, and for the quality of the beef, or butter, or cheese, made from animals fed with such materials!—*Alfred Gyde, Painswick.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

(DRAINAGE, *Continued from page* 378.)

SHOULD the field be in Grass at the time of draining, the breadth and position of the drain are marked off with a spade and line in the usual manner, and the surface-sods laid carefully aside for after use ; but in almost every other case the drains are marked off, and partly opened at the same time, by a plough passing up the furrows to be drained, and throwing out a deep furrow-slice, which materially abridges the labour in cutting. The plan now almost universally adopted is to contract with one or more skilful workmen to execute the cutting or opening of all the drains, to be made for a stipulated rate of wages, per rood of 18 ft. The contractor employs as many assistants as may be found necessary for the completion of the work within the assigned period, and is alone responsible to the farmer for the faithful execution of the job. When the drains are not very long, each man takes one to himself, and completes its opening—an arrangement which usually excites the labourers to a kind of competition, thereby securing the proper and speedy execution of the work. Two sizes of spades, a pick and a narrow shovel, are the only tools employed. The workmen in cutting throw the earth to both sides of the drain, in order to facilitate its ploughing in afterwards. It is, perhaps, superfluous to observe in this place that the cutting is in every case commenced at the lower, and the filling at the

higher level; the water, if any happen to be present, thus escapes from the workmen, which not only insures to them a comparatively dry footing, but also points out any defects in the work already gone over.

The materials used in filling drains are stones, tiles, and, in many instances, both combined; stones are generally preferred, when they can be conveniently and cheaply procured, but the great amount of manual and horse labour necessarily attending their use, together with the injury always sustained by land requiring draining, from much cartage, are inseparable obstacles to their employment to any considerable extent in this district. Tiles are therefore more extensively used, even when stones are available in the same field, the work being with them much more expeditiously and economically performed. In many instances six or seven inches of broken stones are thrown on the top of the tiles—a practice of unquestionable utility, for many obvious reasons. Coal cinders have also been employed very usefully for the same purpose.

When stones are used, they are laid down at regular intervals along the line of the drains, before the cutting is commenced, or while it is in the course of being performed, it being the invariable practice to fill every drain, as soon after its opening as possible, in order to prevent the sides from falling in. The filling being justly regarded as a very important part of the business of draining, and one to which too much attention cannot be bestowed, is invariably performed by the regular farm-servants, under the superintendence and direction of the farmer himself, or his steward. The usual mode of procedure is as follows:—A man or boy first breaks the stones to the size of common road-metal,* 2½ to 3 inches in diameter, and he must be a heap in advance of the women and boys who collect the broken stones into baskets, which, when filled, are handed to the steward or some other careful man in the drain, whose duty, besides emptying the baskets, is to see that every particle of soft earth is previously well cleaned out, that none but the smallest sized stones are used for the bottom of the drain, and that the stones are at the proper distance—commonly 15 inches—below the surface of the land. The small stones collected from the Grass and other fields, are much esteemed for draining; they require little or no breaking, and are generally shovelled out of the carts into the drains. The stones, after being carefully levelled at the top, are covered with the surface sods previously laid aside for that purpose, if the field is in Grass, or with straw.

Tiles, for the reasons already assigned, are most generally used in filling drains. The usual size is 3½ inches wide, 4½ inches in height, and 14 inches in length. When taken out of the carts the tiles are laid along the line of the drains in such a manner as to determine very nearly the number required for any length of drain, and also to enable the man who lays the tiles in the bottom of the drain to reach to them without the aid of an assistant. When they do not meet quite closely, the interstices are filled up by wrapping a short piece of straw-rope around the joinings, in order to prevent any particles of earth from entering the drain. When the bottom of the drain is very soft, soles of some kind or other are employed. Those generally used are made and sold at the tile-works, but being rather expensive, soles of thinly-sawn wood are used in some places, particularly in the neighbourhood of saw-mills. It may be observed here, that there is a general tendency amongst the farmers to adopt smaller sized tiles than those hitherto employed. Small pipe-tiles are also sometimes used with advantage. It is a common practice, contiguous to the sea-coast, and other places where sand and gravel can be easily procured, to lay from four to seven inches of either of these, but especially the latter, over the tiles. The earth is always filled in with the plough, a long swing-tree being used for the purpose of enabling the horses to walk on opposite sides of the drain. The loose friable surface soil is placed next the tiles or stones, and the more tenacious subsoil ploughed out into the ridges, after which a good harrowing completes the operation of draining.

In ploughing drained fields, the furrows are invariably made over the drains, in order to facilitate the ready escape of rain-water; and so useful and necessary is this considered, that when the precise situation of the furrows in which the drains had originally been made, is not distinctly visible, as generally occurs after fallow and green crops, their position is accurately ascertained by digging with a spade until the stones or tiles are reached, and the ridges laid off accordingly. In some places, however, ridges in thoroughly drained fields are altogether dispensed with, a slight rut or mark made with the plough serving to regulate the sowing and reaping.

The system of draining which I have now endeavoured to describe, is that generally practised in the low districts of this county, but many other simple modes of removing surface water are pursued in the Lammermoor sheep-pastures. Sometimes a deep furrow is turned up at regular intervals by a stout plough, furnished with two coulters attached in a peculiar manner to the beam, which is sufficient to collect and void a considerable quantity of water; sometimes a man with a spade pares off the soil from the inverted sod, reducing it to the thickness of about 2½ or 3 inches. It is then restored to its original situation, with the grassy side uppermost, leaving a pipe or hollow beneath it, of 3 or 4 inches in depth, for the conveyance of water. Another very simple kind of superficial draining, much practised in similar situations, is thus made:—When the line of drain is marked off, a sod of about 4 inches deep, and 1 foot wide, is taken out and carefully laid to one side; another man follows with a narrow spade, and further sinks the centre of the drain 6 or 7 inches, leaving what is termed a shoulder on each side; the sods first cut out are then placed so as to rest firmly on the shoulders left for that purpose; an open space is thus left below the turf for the passage of water. This species of draining is extensively practised in some hilly pastures, and where the sward is sufficiently tough, and the work carefully executed, such drains are found to be permanent, and frequently quite efficacious, after a lapse of more than twenty years from the period of their construction.

The expense of draining, according to the system now described as that generally practised in the Lothians, varies, of course, with the nature of the soil, depth to be cut, rate of labour, and other local circumstances. As the farmers are very solicitous to have the work well performed, the plan most commonly adopted by them is to contract only for the opening, or *casting*, as it is here termed—the filling being done by persons paid by the day, as much greater security is thus insured, for having the latter part of the work properly executed; persons working at daily wages, and under the direction of the master, or his steward, having no interest in hurrying over this most important part of the operation. The rate of cutting varies from 2½*d.* to 4½*d.* per rod of 18 feet, according to circumstances. Small draining-tiles cost, until very lately, so much as 34*s.* to 36*s.* per thousand; but, in consequence of the great increase in the number of tile-works in every part of the county, and the general adoption of improved modes of preparing and forming tiles, by steam-driven machinery, the cost has latterly diminished to 22*s.* and 24*s.* for tiles, and to 16*s.* for soles. In most cases the entire expense of draining is defrayed by the tenants; but, in justice to the East Lothian proprietors it must be stated, that many of them contribute a considerable portion of the expense, where the exertions of the tenant seem to merit such a reward. Some landlords pay for the opening of the drains, the tenant doing the remainder. Others of them allow a considerable annual reduction of the rent during the first ten years of the tenant's occupancy. A large number of the proprietors, again, have tile-works erected in some suitable part of the estate, from which the tenants obtain tiles, either altogether free of expense, or at very reduced prices. An arrangement between landlord and tenant of a most useful tendency has been lately adopted by some, which is, that the former defrays the entire expense of draining in the first instance, the latter paying him a certain per centage for the money so expended. Draining, though the first, is not by any means the only indispensable source of expenditure to be undertaken on entering a newly-rented farm; a liberal allowance of lime, and other manures, also becomes absolutely necessary, besides numerous other matters, demanding a considerable outlay of capital at the very outset. Such a loan as that now referred to, must then be of unquestionable utility to the tenant, preventing, in a great measure, the crippling of his resources, and consequent inability to proceed in the cultivation of his farm with spirit and success.—*T. Sullivan.*

* It may, perhaps, be necessary to state that this term is applied here to the broken stones used for repairing the public roads, those employed for filling drains being broken to the same size.

Home Correspondence.

Broad-shearing.—In answer to Mr. Grey of Dilston's inquiry respecting broad shearing, it is simply paring the ground to the depth of about 2 inches, which is sometimes effected by attaching a share of 18 inches in width to the Sussex wheel-plough, which is drawn by two horses; sometimes by the Sussex cultivator, an iron implement of 5 feet in width, with shares 12 inches in width, drawn by four strong horses; this can only be used where the land is level on the surface; if the land is in ridges or otherwise unlevel, the plough is used; after this the land is harrowed, and the rubbish collected and burnt.—*A Sussex Farmer.*

Failure in the Wheat-crop.—Your correspondent "R. Arthur" describes what he supposes a new cause of failure in the Wheat crop, but which is, and long has been, too well known; it is caused in the manner he describes by the wire-worm. Frequently, in March, patches of withering Wheat plants may be seen, which on examination will be found to contain the worm in the centre of the stem; it is hard and very tough, requiring a sharp pinch with the finger and thumb to crush it; it is of a dirty yellow colour, with a black head, is about six lines in length, and half a line in thickness. I have not heard of any method of destroying them; perhaps the rooks and starlings are the farmers' best assistants in this case. I have also met with a worm in the gardens, answering the above description in all respects, except in being about thrice as thick.—*Lusor.*

Thistles.—That troublesome species (Cnicus arvensis) which infests our pastures and is so difficult to keep down, may be extirpated in a couple of seasons, by drawing them. For years I tried the usual methods of mowing, spudding, &c., without success, till it occurred to try the effect of drawing; accordingly I employed some women, defending their hands by pieces of old sacking, and taking advantage of a time when the soil was thoroughly softened by a continuance of wet weather; the Thistles were drawn with much ease, bringing up frequently from 12 to 15 inches of the root. The expense was a mere trifle, sometimes under 1*s.* per acre; and in two years the land was pretty well cleared. I think the part of the root left in the earth was at too great depth to vegetate: other root weeds may be buried; the Couch (Triticum Repens), if buried only six inches deep, will not make its appearance again; probably trench-ploughing is the cheapest and best mode of getting rid of it (?) With regard to Thistles, I do not think every farmer considers them injurious. It once was, and probably still is, the practice with some graziers in the rich Somersetshire marshes, when, in the spring, the young Grass is succulent and laxative, to let the herdman cut a small portion of the Thistles every morning; which, when withered, are readily eaten by the cattle, and are believed to counteract the too aperient tendency of the young herbage, and improve the health and condition of the cattle.—*Lusor.*

Yew.—Observing in your last Number an inquiry respecting the poisonous effects of the Yew when eaten by cattle, I have been induced to make a few observations on its effects on the animal economy. The Yew (Taxus Baccata) is a narcotico-acrid poison, producing in animals that have eaten of it a degree of heaviness, increasing to stupor, from which it is with much difficulty that they can be roused, and they ultimately die without any symptoms of pain. It is well known to vegetable physiologists that medical plants possess properties differing in intensity at different periods of the plants' growth; thus the leaves of plants, such as hyoscyamus and digitalis, possess the most active properties when the plants are in bloom, their activity diminishing as the season advances, until they are of little or no value as a medicine when the leaves have reached maturity, and withered on the parent stem. May this not be the case with the Yew? the leaves of which may possibly be eaten by cattle without producing any very serious effects, at one season of the year, while at another they may act as a deadly poison. It is believed, also, that the Yew is more virulent as a poison when in a withering state, after it has been cut from the tree, than when fresh and growing. May not this possibly occur from the changes going on in the leaf itself? the leaves of plants in the autumn, and also in a dying state, change from a green to a brown colour; this change is accompanied with an absorption of oxygen from the atmosphere, which, acting on the green colouring matter of the leaf (chlorophyle), slowly oxidises it. May not this action in the leaf of the Yew sharpen the activity of the poisonous matter already contained in it? This is rendered probable, since we know that some plants grown under unfavourable circumstances generate a poison, which disappears when the circumstances are altered; thus, the common Potato, when grown in the dark, contains in its stem a deadly poison (solanine), which disappears after it has vegetated in the light for a short time. These hints may possibly assist in clearing up the question, showing that the action of the Yew, as a poison, on the animal economy, may be greater at one period of the year than at another, and that the animal may eat it in the green state without producing death, while in the dry state it may prove fatal.—*Alfred Gyde, Painswick.*

Rooks.—Observing, in the *Agricultural Gazette* of June 1, an article calculated to aggravate the sufferings of the poor rooks, you will, I trust, excuse my offering a few words in their favour, more especially as I consider them about to be put in fresh jeopardy, in consequence of a mistake as to one of their most valuable acquirements. Owner of a considerable rookery in a locality where it is the fashion to consider them as pests, I declined joining in a hue and cry against them, at least until I should, by observation and experiment, ascertain whether my predilection for them was merited. Among other tests was the somewhat cruel one of watching them at feed during the spring seed-time, and shooting one or two per diem on their return homewards. I commenced this process with the Oat-sowing early in April, and during the first ten days found the contents of the stomach to be entirely grub, wire-worm, a worm with two rings round its body, a few earth-worms, and now and then a beetle, such as occur in the droppings of cattle. This was the general result until about the 20th of the month, when my faith was staggered by finding in the craw at least a score particles of Oats in the husk; but immediately observing a small whitish streak under the envelope of the husk, I examined it, and found inside, embedded on the kernel, a wire-worm extended lengthwise, gorged with its milky substance, and in colour exactly the same as the juice it was feeding on. Every single particle was similarly occupied, and during the next fortnight, during which the corn was in that state of transition, we found this the principal article of their food. After the first week in May, the wire-worm attained its natural size and colour, and from the same time not one particle of grain of any sort has been found in the stomach of a single rook. My rookery exhibited the same appearance as that described by "Facile"—heaps of chaff, or husk, every one of which, in my case, and I doubt not in his also, was the winding-sheet of a wire-worm.—*Acer.* [We shall be very glad to insert any detail of investigations on this subject, with which our correspondent may favour us.]

Hints on the Use of various Manures.—Guano, when good, ought to be of a light-brown, or fawn-colour, dry and powdery, not sticky or clammy to the touch, and the lumps when broken showing numerous small, clear, shining crystals, and giving out a strong smell of ammonia when mixed with a little quicklime, and moistened with water. Guano should be kept quite dry till used, as damp renders it liable to decomposition and the loss of ammonia; and it should never be brought in contact with quicklime, which, as has been remarked, drives off the ammonia; but guano may be used on land that has been limed a short time before, and the lime well mixed with the soil, particularly after heavy rain. Bone-dust and gypsum are too well known to require any remark. The burned gypsum is the best—costs about 30*s.* per ton. Sulphates of soda and magnesia can be got, the

former at about 3*l.* 10*s.* per ton, the latter from 6*l.* to 7*l.* per ton. In using guano for Potatoes it ought to be applied at the rate of three cwt. per acre, either sown by the hand in the drills, or broadcast just before the drills are formed, and 18 cubic yards of dung spread below the Potato *cut*, and the whole covered in the usual manner; the Potatoes set, as they are cut, being first dusted with gypsum in powder. Or the guano may be mixed as follows:—3 cwt. guano, 1 cwt. gypsum, 1 cwt. sulphate of soda, ½ cwt. of sulphate of magnesia, and 1 cwt. of common salt, sown broadcast as above mentioned, and 18 cubic yards of dung in the drills. This last mixture appears, after repeated trials, the best for Potatoes, and to give a larger crop than 40 or 50 cubic yards of the best farm manure; and the after-crops, as far as can be judged of from trials for the last three years, do not seem to be inferior, and in some cases are better than when farm-yard manure alone had been used. The same mixture as for Potatoes answers well for Turnips with a little dung; but a cheaper one without dung seems to answer as well, viz., guano, 2½ cwt., bone-dust, 6 cwt. or 15 bushels, and of gypsum, common salt, and sulphate of soda, 1 cwt. each, to be sown broadcast on the land, which is immediately to be formed into drills in the usual manner, or with the double-mould plough, and the Turnip-seed sown with the barrow. *Mixture for Top-dressing Hay, Pasture-Grass, and Oats.*—Hay to be cut (if top-dressed with the following mixture), viz.:—1 cwt. guano, 4 cwt. or 10 bushels fine bone-dust, 1 cwt. gypsum, and 1 cwt. of common salt, give a third more produce in Hay, and the after foggage, both of that and the succeeding years, is much improved. The same dressing may be applied to old or young pastures with great benefit, and makes the land to carry at least one-third more stock, besides benefiting the after crops. This dressing may also be applied with benefit to Corn, Barley, Wheat, particularly in poor lands, and where the straw is likely to be short. All top-dressings of ammoniacal and other salts should be applied in rainy or moist weather, early in the season, *i. e.*, in April, just as the Grass or Corn is beginning to spring. The following are some of the experiments, showing the effects of the manures mentioned above, in 1843:—

POTATOES (Perthshire Reds), planted 25th to 27th April, 1843.

Destroying Rabbits.—Since writing to you on the means of destroying Rabbits (see page 317), I have heard of a still better plan, which is commonly adopted in Derbyshire, viz., making a covered pit with a trap-door nicely balanced; to this the Rabbits must be enticed by their favourite food, Parsley or Cabbage-leaves, and allowed for a short time to run over the trap; it may then be set, and it is sure to catch them alive. This is an excellent trap too for rats and mice, and in fact all kinds of vermin. —*J. B. C.*

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE Right Hon. Earl Spencer, President, in the chair.

NATURAL MANURES.—Professor Sewell presented to the Council the following analysis, made for him by his friend Dr. Spurgin, of the substance (resembling mouldy peat) transmitted to the Society on the 17th of April last, by Mr. Churchill of Colliton, near Dorchester; occurring in considerable quantities in a sour Kimmeridge clay on his farm, and found to be an excellent manure for his Grass lands:

Silica	70
Organic Matter	10
Sulphates of Lime and Magnesia, Oxide of Iron, &c.	17
Moisture	3
	—100

The Council returned to Professor Sewell their best thanks for the favour of this communication.

KELP ASHES.—Dr. Burgess, of Margaret-street, Cavendish-square, presented a sample of a manure, which he thought might be worthy of the consideration of the Society; namely, the ash of the common kelp of commerce. He thought this application would be found advantageous on stiff clay soils deficient in saline matter. It was very cheap, being delivered in London by Messrs. Adam White and Co., of Leith, at 3*l.* 10*s.* per ton. Dr. Burgess conceived that, although the kelp ash does not contain the volatile alkali ammonia, or possess the animalised properties of guano, it could not fail, on account of the potash, which constituted its most active ingredient, to be useful on such soils, which he believed were always benefited by the vegetable alkalies.

MOISTURE IN MANURES.—Mr. Davenport laid before the Council an interesting communication he had received from Mr. Bernays, of Manchester, on various topics connected with the progress of agricultural improvement in the midland counties. Mr. Hubbersty, of Wirksworth, in Derbyshire, had set apart a portion of his land for the trial of experiments with ten different manures: the soil had been analysed, and the produce when obtained in each case would be separately weighed and also analysed. Mr. Bernays thought it worthy of remark, that although only one slight shower had then fallen since the manures were sown, the land manured with guano and charcoal had not only equalled that on which the other manures had been applied, but totally outstripped the portion manured with farm-yard manure; while the land to which guano alone was applied had not at that time kept pace with the farm-yard manure lot, in consequence of the want of rain. Mr. Bernays thought these facts were worthy of remark, inasmuch as the beneficial effects of charcoal in dry weather, as a retainer of moisture, and an absorbent also of carbonic acid and ammonia, and other gaseous matter, are clearly proved. Mr. Bernays did not hesitate to say, that if the land to which artificial manures were applied were strown in dry weather with a top-dressing of chloride of calcium, the baneful effects of a drought would be unknown, and the crops increase to a marvellous extent. The chemical substance thus recommended by Mr. Bernays has long been known under the name of muriate of lime, as one of the most deliquescent of our salts. It may easily be obtained by the action of spirit of salts on common chalk. When exposed to the atmosphere it remains constantly damp; and, by the French chemists of the last century, was regarded as a powerful stimulant, when applied in very dilute solution to the growth of plants. Professor Solly, in his Agricultural Lecture at the Royal Institution, on the 19th of April last, refers to the deliquescent effect of this salt, and its communication of dampness to soils (or the power of retaining water in their pores), when diffused through them in very minute quantity by means of a solution in water.

GUANO.—Mr. Davenport also communicated the results of his own experiments in Cheshire, with guano, bones, gypsum, and farm-yard manure; and the Rev. Thomas Cator various analyses of guano, and the results of his experiments with that manure, tried along with bone-dust, rape-dust, dove-manure, and fold-manure, on lands of different character; all of which papers were referred to the Journal Committee.—Mr. J. H. Sheppard, of Sparling-street, Liverpool, informed the Council that he was preparing a Treatise on guano, containing 500 trials of its efficacy in comparison with farm-yard manure and bones, which, when complete, he should offer for the acceptance of the Society. He stated that such was the amount of adulteration in the article, that there had been sold in Liverpool, as guano, double the quantity of genuine guano that had actually been imported; and he would, therefore, advise no person to become a purchaser of any of the varieties without having a previous analysis made of the sample offered to him for sale. He recommended parties of agriculturists, who intended to use guano next year, to become at once contractors for the amount required, at 6*l.* per ton, the price at which the genuine Ichaboe variety could now be secured. Mr. Sheppard inclosed in his communication a lithographic print of the Island of Ichaboe, on the western coast of Africa, for the library of the Society.—Mr. George G. Cummings, of Mincing-lane, communicated, through the Marquess of Downshire, a statement in reference to the African guano. He was about to send out several vessels to the Island of Ichaboe, which were expected to return to this country by the first or second month of next year; when all parties, whose orders were received at the present time, would be entitled to have it delivered at 6*l.* per ton; the guano being obtained free of expense on the coast of Africa, and the only charges attendant on the speculation, those of the collection, freight, &c., which last year had amounted to from 5*l.* to 7*l.* The high price of guano at the present moment, and the extensive adulteration of it by fraudulent dealers, were great obstacles to its purchase and efficiency.—Messrs. Carson and Gilgour, of Exchange-buildings, Liverpool, transmitted to the Society a list of the various places in different parts of the world where guano was likely to be found. They conceived that it would occur probably on all islands of a volcanic nature, of good quality; but that beyond the limits of 28 degrees north or south of the equator, its properties were likely to be less valuable. The list comprised the latitude and longitude of 80 distinct geographical positions.

The following communications and presents were received with the best thanks of the Council:—Mr. Jonas Webb—a copy of the printed order of the Privy Council in 1747, containing further rules, orders, and regulations for more effectually preventing the spread of the distemper then raging amongst the horned cattle; Colonel Rawstorne—a letter from Mr. James Dixon on the subject of the present complaint among cattle; Mr. Henry Hudson, of Wick, Worcestershire—a letter on the Turnip-fly; Mr. Christopher Johnson, Lancaster—communications on a grub in Wheat; Rev. T. Cator, Mr. Frederick Manning, and Mr. Tweed—reports on the draught of oxen; Rev. John Barlow—invitation to Agricultural Lectures at the Royal Institution; Mr. Bates, of Kirkleavington—on the appointment of judges; Lord Western—an oil-painting of a Devon ox, by Mr. Vine (an artist destitute of arms, but a most skilful painter, and exact copyist from nature or art); Mr. Bigg—a model of his sheep-dipping apparatus; Mr. Henry Overman—a model of his milk-trays (with an explanatory paper for the Journal Committee); Mr. Graham, of Bersted Lodge, Bognor—the model of an implement for working among drilled Turnips; Mrs. Le Jeune, of Romsey—Wheat-ears of 1844; Mr. Bernays—notice of the Grass on which the Spanish merino sheep are fed; Mr. Fleetwood, 12, East Suffolk-street, King's-cross—gratuitous offer of sunflower plants to members of the Society; Mr. Comins, South Molton—notice of his one-way or turn-over plough; Mr. John Read—notice of his garden and fire-engines; Mr. Abbot, of Gravesend—letters on cheap periodicals; proceedings of the Jamaica Agricultural Society and the Royal Society of Agriculture at Caen.

A MONTHLY COUNCIL was held at the Society's House in Hanover-square, on Wednesday last, the 5th of June: present, the Right Hon. Earl Spencer, President, in the Chair; Duke of Richmond; Marquis of Downshire; Earl of Euston; Earl of Ilchester; Viscount Torrington; Lord Camoys; Hon. R. H. Clive, M.P.; Hon. G. H. Cavendish, M.P.; H. Allen, Jun., Esq.; R. Archbold, Esq., M.P.; Col. Austen; T. Raymond Barker, Esq.; G. Raymond Barker, Esq.; John Raymond Barker, Esq.; T. W. Bramston, Esq., M.P.; F. Burke, Esq.; R. H. Cheney, Esq.; R. Etwall, Esq., M.P.; A. E. Fuller, Esq., M.P.; B. Gibbs, Esq.; S. Grantham, Esq.; Sir John Guest, Bart., M.P.; John Hudson, Esq.; R. H. Hurst, Esq., M.P.; W. H. Hyett, Esq.; G. Kimberley, Esq.; J. Kinder, Esq.; Sir Francis Lawley, Bart.; Sir C. Lemon, Bart., M.P.; W. Miles, Esq., M.P.; Col. Pennant; F. Pym, Esq.; Prof. Sewell; J. B. Simonds, Esq.; T. H. S. E. Sotheron, Esq., M.P.; and W. R. C. Stansfield, Esq., M.P.—The following new Members were elected:—

Pittis, George, Wymoning, Portsmouth.
Washbourn, William, Tillingdown, Tandridge, Surrey.
Ethelston, Rev. Charles W., Uplyme, Lyme-Regis, Dorset.
Michel, Lieut.-Col., Dewlish House, Blandford, Dorset.
Aplin, Henry, Misterton, Crewkerne, Somerset.
Lacon, John E., Ormesby House, Great Yarmouth, Norfolk.
Curtois, Rev. R. G., D.D., Nile Terrace, Rochester, Kent.
Dyke, George Potton, Christchurch, Hants.
Hodding, Edward Davis, Odstock, Salisbury.
Beale, James, Canford, Wimborne, Dorset.
Hart, Thos. Fred., Barham House, East Hoathley, Hurst-Green, Sussex.
Gale, Richard Christopher, Winchester.
Girdlestone, Rev. H., Salisbury.
Young, J. G, Salisbury.
Ellis, Charles, Franklans, Burgess Hill, Sussex.
Blunt, Rev. Walter, Longstock, Stockbridge, Hants.
Lewis, Anthony, Mist, Nether Wallop, Andover.
Elton, Sir Edward Marwood, Bart., Widworthy Court, Honiton, Devon.
Padwick, Wm. Fred., Manor House, Hayling, Hants.
Gamlen, Wm. Hornsey, Hayne House, Tiverton, Devon.
Brooke, Sir Arthur B. de Capell, Bart., Oakley, Kettering, Northamptonshire.
Elliott, Thomas Christopher, Southampton.
Elliott, John, Chichester, Sussex.
Willis, Joseph, jun., Bucknowle, Corfe Castle, Dorset.
Lankester, Joseph, Southampton.
Lankester, William, Southampton.
Robson, John, East Kielder, Hexham, Northumberland.
Bridger, James Weddel, Belmont, Chigwell, Essex.
Williams, Herbert, Stinsford House, Dorchester, Dorset.
Phelps, John Bryant, Monkton, Dorchester, Dorset.
Jenkins, John, jun., Caerleon, Newport, Monmouthshire.
Voss, William, West Bucknowle, Corfe Castle, Dorset.
Rowe, William North, Cove, Tiverton, Devon.
Gough, Edward, Gravel Hill, Shrewsbury.
Blachford, Lady Isabella, Osborne, Isle of Wight.
Gater, George Henry, Westend, Southampton.
Halsey, Rev. J. F. Moore, Gaddesden Park, Hemel Hempsted, Herts.
Witham, Henry, Lartington Hall, Barnard Castle, Durham.

The names of twenty-eight candidates for election at the next meeting were then read.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, presented to the Council the monthly report of the examination of the accounts, and the state of the funds to the end of May. He stated

that 200*l.* having been already paid on account of the Southampton Meeting, there remained in the hands of the bankers the balance of 800*l.* on account of the Southampton subscription of 1000*l.*; and a balance of 1600*l.* on the general account of the Society. He had the satisfaction of announcing to the Council, that in the course of ten days after the recent general meeting, no less than 500*l.* had been received for subscriptions; and, as that amount consisted chiefly of arrears due to the Society—paid up probably from the just representations of the claims of the Society upon its members, made on that occasion—he entertained, in common with the other members of the Finance Committee, a well-grounded trust that extreme legal measures, under the powers of the charter, might, in the greater number of cases, if not altogether, be obviated by the continued and prompt payment of the remaining arrears. Their duty to the Council, however, imposed upon the Committee the painful necessity of recommending immediate legal steps to be taken against certain parties who were in arrear, and they had made the requisite arrangements for such a process accordingly. The Council then unanimously adopted and confirmed the report, and gave the requisite authority for carrying out the recommendations it contained.

Southampton Meeting.—The Duke of Richmond, Chairman of the General Southampton Committee, presented the report of their proceedings. The whole of the arrangements were in a most satisfactory state of progress; and the Committee received from Colonel Henderson, the Mayor, and the authorities of Southampton generally, the most cordial and efficient co-operation in completing the details on every point of the business connected with the ensuing meeting. The numerous entries for the Show, and the interest connected with the occasion, gave a promise that the meeting would be one of a most successful character. Already it had been necessary to enlarge the plan of the Show-yard beyond the limits of that at Derby; it was still, however, found that more space for exhibition was required, and the Committee then applied to the Council for authority to enlarge the Show-yard for implements, by an extra quantity of 756 feet run of shedding, and to purchase no less than 1500 iron hurdles, each 6 feet long, for the Cattle-yard, of Messrs. Cottam and Hallen, the manufacturers, and contractors for that amount. This report was unanimously adopted.

On the motion of Mr. Miles, M.P., seconded by the Duke of Richmond, Mr. A. Fletcher, of Millbrook, Southampton, was unanimously appointed the Auctioneer of the Society for the Southampton Meeting.

A weekly Council was held at the Society's House in Hanover-square, on Wednesday last the 12th of June; present—The Rt. Hon. Earl Spencer, President, in the chair; Marquess of Downshire, Earl of Lovelace, Lord Bridport, Hon. Captain Spencer, Hon. G. H. Cavendish, M.P., T. Alcock, Esq., J. Arkwright, Esq., J. Baines, Esq., D. Barclay, Esq., M.P., T. R. Barker, Esq., G. R. Barker, Esq., J. R. Barker, Esq., J. Benett, Esq., M.P., E. Bowly, Esq., Sir A. B. de Capell Brooke, Bart., T. W. Bramston, Esq., M.P., J. W. Brown, Esq., W. R. Browne, Esq., F. Burke, Esq., Col. Challoner, F. C. Cherry, Esq., H. Colman, Esq., C. Cure, Esq., J. Dean, Esq., J. H. H. Foley, Esq., A. E. Fuller, Esq., M.P., B. Gibbs, Esq., H. Gibbs, Esq., J. B. Glegg, Esq., W. L. Gower, Esq., H. J. Grant, Esq., Sir J. V. B. Johnstone, Bart., M.P., G. Kimberley, Esq., J. Kinder, Esq., J. Kirsopp, Esq., J. H. Langston, Esq., M.P., Col. MacDouall, W. Miles, Esq., M,P., J. W. L. Naper, Esq., A. Ogilvie, Esq., J. Parkes, Esq., C.E., E. Parkins, Esq., E. W. H. Pendarves, Esq, M.P., Col. Peunant, C. Pocock, Esq., Prof. Sewell, J. V. Shelley, Esq., Rev. T. P. Slapp, Rev. T. Staniforth, W. R. C. Stansfield, Esq., M.P., T. E. Thomas, Esq., C. H. Turner, Esq., Sir H. Verney, Bart., and W. Whitmore, Esq.

Francis Popham, Esq., of Littlecott, near Hungerford, Berkshire; and William Bruce Stopford, Esq., of Drayton, Northamptonshire, were elected Governors, and the following gentlemen Members of the Society:—

Fowler, Michael, Little Bushy Farm, Stanmore, Middlesex
Woodrow, William Robberds, The Place, Tombland, Norwich
Crawhall, Wm., Stagshaw Close, Hexham, Northumberland
Crawhall, Isaac, White House, Stanhope, Bishop-Auckland
Tatham, Thomas James, 27, Bedford-place, Russell-sq.
Crawter, Thomas, Cobham, Surrey
Crawter, Henry, 7, Southampton Buildings, Chancery-lane
Marshall, John, Latimers, Chesham, Bucks
Harfield, Robert, Southampton
Apperley, W. H., Hereford
Mellor, John, Little Aston, Lichfield, Staffordshire
Driver, Rolles, Southampton
Lowson, Newby, Wilton-le-Wear, Bishop-Auckland, Durham
Bowser, Richard, Bishop-Auckland, Durham
Bowser, William, Tunstall, Hartlepool, Durham
Herring, T. B., Finchley, Middlesex
Symons, Thomas, Coryton, Launceston, Cornwall
Andrews, Richard, Above-Bar, Southampton
Jacob Jacob, St. Cross, Winchester
Harding, Stephen Toghill, Stinsford Farm, Dorchester, Dorset
Bursey, John, Milton, Christchurch, Hants
Richardson, William, Southampton
Aldridge, William, Southampton
Rodd, Francis, Trebartha Hall, Launceston, Cornwall
Currie, James, Hillside, King's-Langley, Herts
Sainsbury, George Taylor, Devizes, Wilts

The names of eleven candidates for election at the next meeting were then read.

Bye-Laws.—The President, on the part of the Bye-Law Committee, laid before the Council the draught of new Bye-Laws, recommended for the consideration of the Council.

On the motion of Mr. Raymond Barker, the President was requested to direct a Special Council to be held for the purpose of taking this Report into consideration. The President then ordered that such Special Council should be summoned for Tuesday, the 16th of July, at one o'clock.

Agricultural College.—Mr. Bowly and Mr. Brown transmitted to the Council various documents connected with the establishment of an Agricultural College on an example farm in the oolitic district, including the country commonly called the Cotswold Hills, extending from Bath to Chipping-Camden; also including a great part of Oxfordshire and North Wiltshire, part of Berkshire, &c.

The following were among the communications received by the Council: a drawing and description of the new double cheese-press, invented by Mr. James Adams, jun., of Parks Cottage, Southwell; a Treatise on Adulterations in Artificial Manures, and a Chemical Apparatus Chest, presented by Dr. Robinson; and the Journal of the Agricultural Society of Western Australia. The Council then adjourned to Wednesday next, the 19th of June.

ROYAL INSTITUTION.

May 24.—Lord Prudhoe in the chair. The subject was The Application of Geology to Land-draining, by Wm. Ogilby, Esq., Sec. Zool. Soc. Mr. Ogilby commenced by stating some of the more prominent injuries inflicted on the soil by stagnant water. He explained more especially how the land was rendered cold and late by the great capacity of water for heat, as compared with clay or sand; the same quantity of heat which is sufficient to raise the temperature of earth or mould four degrees of Fahrenheit, and of common air five degrees, being only sufficient to raise that of water one degree; the residue being absorbed by the water and rendered latent. Consequently, when the land is saturated by water, the sun's rays, instead of being expended in heating the soil, are absorbed and rendered latent by the water which it contains, and the soil derives but one-fourth of the warmth which it would do were it filled with common air instead of water. Other injurious effects were, that it soured the land, and gave rise to the formation of substances hurtful to vegetation. These were caused by the exclusion of common air and the oxygen which it contains from the pores of the soil. Vegetable and animal manures thus remained imperfectly decayed, or decay was converted into putrefaction, and acetic, malic, tannic, gallic, and other acids, substituted for carbonic acid and ammonia, the products of simple decay, and which, with the elements of water, are now recognised as the chief agents in the nourishment of plants. Superabundant moisture, likewise, rendered the climate of a country insalubrious; but its injurious effects were more immediately recognised in supplying the roots of growing plants with a greater quantity of moisture than they are able to digest, and thus rendering them weak and dropsical. Mr. Ogilby next proceeded to explain how these injuries might be remedied by efficient draining; and observed that land was rendered wet and unproductive from two sources; first of all by rain falling on the surface of a stiff clay soil, or stagnating within the pores of a loamy soil, incumbent on an impervious subsoil; and, secondly, by springs overflowing the surface from some higher ground, or oozing up from beneath the soil itself. These two different forms of disease required different modes of treatment; the system which would accomplish a radical cure in the one case, might, indeed, alleviate the effect, but could never remove the cause in the other; and Mr. Ogilby stated that the great error of modern writers on draining consisted in not being aware of, or at least not sufficiently distinguishing, these different causes of wetness in land, and the different modes of treatment which were applicable accordingly. The common method of surface-draining, which was so much in vogue at present, and which was necessary and efficient for the discharge of rain-water, would produce but a partial effect in alleviating the injuries caused by subterraneous springs; and that too at an enormous cost, compared with the expense of simple and more appropriate modes. High-lying arable soils, especially in Ireland, Scotland, and the West of England, were frequently injured by both causes; but the greater part of the mischief commonly arose from the rains which fell so abundantly in these localities, and it was to such lands that the system of furrow-draining was peculiarly applicable. The principles of this system consisted in cutting parallel drains at equal distances of from fifteen to thirty or forty feet asunder, according to the tenacity or lightness of the soil, and leading them all into one or more main drains, according to the inequalities and size of the field. Great differences prevailed among practical drainers as to the distance, depth, width, fall, and direction of the parallel drains, which Mr. Ogilby ascribed to the different circumstances of soil, climate, and situation in which the several observers had found particular modes most efficient, and deprecated the idea of any one system or set of rules being universally applicable to all circumstances and localities. The distance of the drains he stated to depend entirely on the nature of the soil, of which it should vary inversely as the tenacity; in the stiffest soils experience proved that the drains were perfectly efficient at 15 feet apart, and in very light soils at from 30 to 40 feet. The depth was not subject to much variation or controversy; from 30 to 36 inches was generally sufficient, it being always understood that the main drains should be at least 6 inches deeper than the parallel. The width of the parallel drains should depend on the quantity of water they had to carry off; if the flow be insignificant the drain should be cut very narrow, generally not more than 2 or 3 inches wide at bottom, otherwise the water will stagnate, instead of running freely off; if the flow be more considerable, the drain must be made wider in proportion, to prevent a too rapid current from tearing up the bottom, and in time choking the drain. As to the fall and direction of the drains, it was stated that great differences prevailed, especially where the land lay on the face of a hill, and had a considerable slope; one party maintaining that they should be run perpendicularly up and down the face of the hill, another that they should be run diagonally across it. Mr. Ogilby believed both opinions to be right, under particular circumstances, but that neither of them was a correct expression of the actual principle upon which the direction of the drains depended, which he stated to be that the parallel drains should cut the different strata of the land perpendicular to the line of strike, whilst the main or leading drains should be across the direction of the dip. This position was illustrated by a large section of the Isle of Wight, and strengthened by the well-known greographical fact. that it is consonant to the system which Nature presents in the direction of large rivers and their tributary streams. After explaining the various methods of filling these drains, by tiles, broken stones, wood, straw, &c., Mr. Ogilby proceeded to consider the case of land injured by subjacent water contained in the bowels of the earth, and forcing itself up in springs from beneath, or trickling down from the tail or outcrop of some overlying strata. This was stated to be the cause of all the great bogs, fens, and morasses, which covered so large a surface in Ireland, Scotland, and some parts of England, and which, when laid dry, produced some of the finest land. This part of the subject was illustrated by numerous geological sections, explanatory of the formation of springs, and the origin of the fens and bogs to which they gave rise. The proper mode of draining such land was discovered and practised extensively during the latter half of the last century, by J. Elkington, a Warwickshire farmer, who had the merit of perceiving the relation which this species of wetness, and the origin of springs in general, bears to the geological stratification of the surrounding country, at a period when the knowledge of stratification was yet in its infancy, and confined to a few inquirers. The great success which attended Elkington's practice, attracted the attention of the Government of the day, and a Parliamentary grant of 1000*l.* was voted to him on condition that he should impart his secret, as it was then considered, to certain individuals appointed by the Board of Agriculture. This was done; and the result, published by Johnstone, one of the persons appointed, displays one of the most beautiful and important applications of scientific principles to practical purposes within the whole range of human knowledge. Yet strange to say, the very memory of Elkington's system seems to be lost at the present day, or remembered only to be condemned as inefficient, though it rests on indubitable scientific principles, and the works of Arthur Young, and the various county reports, are filled with testimonies of its efficiency and success. The truth, however, is, that its application requires a more extensive and scientific acquaintance with the origin of springs, the laws of hydrostatics, and the principles of levelling, as well as a more practical knowledge of the stratification of the earth, than common land-surveyors, or most writers on this subject, can be expected to possess; and of all the practitioners of the present day, Mr. Ogilby stated, that Mr. Stephens, of Edinburgh, was the only individual whom he knew to be aware of the real importance of Elkington's system, or to have practised it extensively. The principles upon which this mode of drainage depends are purely geological. Elkington divides the different strata which compose the globe into two great classes: those which, like sand, gravel, &c. are of a porous nature, and permit water to sink into and percolate freely through them; and those which, like stiff clay, compact rock, and that species of gravel cemented by iron, which is commonly called till, are impervious to water. Suppose, as in the case of the plastic clay, and other geological formations, numerous alternations of porous and impervious strata occur, the rain-water which falls on the outcrop of the porous strata will percolate down through its substance till it arrives at the lowest point, where it will lie upheld by the subjacent bed of pervious clay, and confined by a similar bed above. The porous bed will thus resemble a bent tube, into one or both ends of which water is poured: if one or more holes be bored in the upper wall of the tube at its lowest point, the water will spout out of them like a little fountain; or, if the tube be filled, it will at last overflow at the ends. This is the cause of the wetness which gives rise to bogs and morasses. These swamps always rest immediately on a till or clay bottom, incumbent upon a stratum of sand or gravel filled with water, and cropping out on some high ground in the neighbourhood from which the water descends. The rains of hundreds or thousands of years gradually fill these porous strata, till they at length trickle over the lower edge of the outcrop, forming a continuous line of springs which overflow all the surrounding low lands, or burst up at the lowest point through accidental crevices or weak points of the superjacent clay beds, and give rise to the green welleys and shaking quagmires so frequently met with in fens and turf bogs. The former case happens along the edges of the London Basin, where the clay comes in contact with the subjacent sand beds of the plastic formation; in Kent and Sussex where the weald clay meets the Hastings sand on the one side, and the chalk ranges of the North and South Downs on the other; the latter is almost universally the case in the bogs and fens of Ireland and Lincolnshire. To cure the former species of wetness, it is

only necessary to draw a trench along the line of the springs at a short distance below where they burst out, and sufficiently deep to cut into the porous stratum containing the water, and thus intercept it before it rises to the surface or overflows the land. The line of the drain is determined by the application of the spirit-level, upon the principle that water always stands at the same elevation in the same reservoir or in reservoirs communicating with one another; and in cases where the porous stratum, containing the water, lies too deep to be reached by the bottom of the drain, wells are sunk at intervals, or a large auger is used to make bore-holes in the bottom, up which the water ascends, and of course lowers the spring or reservoir to the level of the bottom of the drain. In the second case, where the bog lies nearly level, and the springs burst up at intervals through accidental crevices in the till or clay bed on which it rests, one or more deep trenches are cut across the bog, in the proper direction to secure a good fall, and wells or bore-holes sunk as in the former instance through the subjacent clay to let the water escape: its level will consequently be reduced to the height of the bottom of the trench, which it is always better to cut down to the clay or till, where the bog is not more than ten or twelve feet deep. Sometimes, when the bog lies perfectly landlocked or surrounded on every side by hills which afford no outlet, the water may still be carried off by sinking a well or bore-holes into a dry subjacent stratum of sand or gravel, and thus letting the water escape beneath. These principles, Mr. Ogilby stated, were applicable to many districts, and afforded the only cheap and efficient system of drainage for lands injured by subjacent water.

FARMERS' CLUBS.

Tiverton.—At the late annual meeting of the Agricultural Society here, which was presided over by Lord Palmerston, his Lordship made the following remarks in illustration of the advantages derivable from Agricultural meetings:—"Each man's experience must inevitably be confined to a small scale—to the range of his own farm, or to the range of his immediate neighbours'; but by these meetings he is able to acquire all the benefits of the experience of a large portion of country. Agriculture has of late years taken an entirely new character. Up to a very recent period Agriculture was a practice; it is now daily becoming more and more a science. In former times men did in Agriculture, as they have been wont at different periods to do in many other departments of knowledge; they groped about very much in the dark. They saw that certain things produced certain results, but they did not know why those causes produced those results. They knew that certain manures were good for certain soils, that certain soils were best adapted to the cultivation of certain produce, that some pastures fattened better than others, but why those different results rose from those different causes, not only the farmer could not tell you, but no man had turned his attention to investigate it. Chemists have of late years turned their attention to Agriculture, and that science which had formerly been considered to be confined in its practical application to medicine, has of late years been turned to the practical advantage of Agriculture, and the agriculturist is in fact a manufacturer. He is a manufacturer of grain, and grass, and cattle. He knows by experience that certain manures are favourable to the growth of certain crops. But the chemist has stepped in of late years, and by careful analysis has told the farmer first of all what are the chemical elements of which his crops are composed; has instructed him what are the substances of which the straw, and the grain, and the grass, and various other vegetable productions, are composed. Well then, the chemist analyses your soil. He tells you what the soil is composed of. By knowing what the soil is composed of, on the one hand, and what the crop you want to grow is, on the other, you can tell whether your soil contains all the elements necessary for the crop, or whether any, and if any, what are the ingredients to be added. Well, this reduces Agriculture, which before was a matter of experiment and trial, to a science very nearly amounting to certainty; because every man can tell, within a certain calculation, whether his soil is adapted to the particular culture to which he wishes to apply it, and if it is not, he knows what manures are necessary in order to render it fit for his purpose. The chemist also teaches the farmer that those chemical substances which are found in his farm-yard, if carefully stored, if carefully collected, and not allowed to run to waste, as has been too much the practice all over the country, are among the most valuable applications which he can add to his soil; and that, in fact, the farm-yard of every farmer contains more valuable manure than he can obtain by a large expenditure of money in purchasing elementary substances from abroad; everybody knew by their experience that marshes containing stagnant water were unfavourable to vegetation. The chemist explains all these various workings of Nature; and when you know what Nature does, and how she does it, you are better able to enlist her natural processes into your service than when you wandered in the dark, without any other guide than that of trial and observation. These are great advantages, which science has of late years brought to assist the practical farmer, as these are descriptions of knowledge which the occupation and pursuits of the farmer prevent him from acquiring."—*Woolmer's Exeter Gazette.*

Miscellaneous.

Drill Husbandry of Turnips.—The Time of sowing the different Varieties on different Soils, and at different Elevations and Latitudes.—1st. As a general rule Turnips may with advantage be sown at an earlier period in the north than would be suitable for the same species, with other circumstances equal, in the south. Thus, although in the East Riding it is common to commence sowing Swedes the second week in May, and to finish White Turnips by the 21st June, in Suffolk it is usual to commence Swedes near the end of May, and white Turnips a month later. 2nd. The effect, however, of difference in latitude is partially counteracted by a greater or less degree of elevation, as well as by a difference of soil, where other things are equal. 3rd. As a general rule, the greater the elevation of the ground the colder is the climate; therefore, if this is not counteracted by a difference of soil or situation, the high ground of the south will have a climate somewhat similar to land in a more northern latitude, at a less degree of elevation, and should be sown accordingly. 4th. Some soils are naturally of a colder nature than others, and a difference in this respect will counteract what is known to be the common effect of any given elevation or latitude. 5th. Any peculiarity of the soil or situation which tends to promote rapid growth and quick maturity will render the land less suitable to be sown early. Thus we see that, although there is said to be a general difference of about three weeks in the proper time for sowing, between the north and the south of England, the occupiers of the hills in Gloucestershire find it desirable to sow about as early as those of the wolds of Yorkshire; also those of some of the rich and low grounds of the East Riding sow about three weeks later than their neighbours on the wolds not 10 miles from them, and consequently nearly three weeks later than those on the hills of Gloucestershire. Similar deviations from those general rules may be met with in most districts where the soil, aspect, or elevation, vary as above alluded to. The proper season for sowing all the common varieties of Turnips does not usually extend over much more than six weeks in any given district. Swedes are generally sown first. Hybrids, being partly of the same nature, are usually sown next, and white Turnips the last, especially if they are intended for late consumption. When for early use, they, as well as the other species, may with advantage be sown at an earlier period. The more solid the texture of the Turnip, as compared with others of its own particular species, the more suitable it will be for late consumption, and consequently for late sowing. To exemplify this, it is only necessary to say, that the White Globe, which, from its quick growth and large size, is highly valued for early consumption, is, by the same peculiarities, unfitted for standing over winter. In districts where about one-fourth of the arable land should each year be sown with Turnips, there is necessarily more work for the horses than could be done within the period best calculated for producing the heaviest crop. Therefore, the occupiers, through fear that they might be driven into a late season for part of their land, and then, perhaps, be almost compelled to sow in unfavourable weather, with scarcely the chance of obtaining a productive crop, will seize on the earliest period, when the weather is favourable, at which a given species of Turnip has been sown in that situation with success. The chances of a heavier crop are so far in favour of what is considered early sowing, as to justify in this case a little risk of being too early, in order to secure the positive benefit of a commencement under favourable circumstances. In districts where the occupiers are most dependent on their Turnip-crop, from want of good Grass-land, it is of great importance to spread the advantage of having Turnips over as long a period as possible: thus, some will sow part of their white Turnips before Swedes. This very early sowing of white Turnips might be ruinous to the crop, were it intended to stand over the winter, but for early consumption may have every recommendation. I say *may*, because everything must depend on the weather of the season in question. Thus, until we have an assurance that successive years will be counterparts of each other, no man can accurately foretel what period of sowing will have the best effect in any given situation. That climate which by its warmth enables the occupiers of land to sow Stubble Turnips with success has the drawback of rendering Turnips more liable to mildew from too early sowing. When Turnips are sown *too* early, there will also be danger of their growing too much into top during the autumn; and if they are sown *too* late, the crop will be light; even a few days will make a great difference in this respect.—*Extracted from Mr. Barugh Almack's Essay, in the Journal of the English Agricultural Society.*

Notices to Correspondents.

BARLEY.—*J. B. C.*—The quantity of seed Barley is necessarily greater than that of Wheat, because of the later period at which it is sown. The young plants have not time to *tiller*.

BONE-DUST.—*Subscriber.*—Bone-dust, and especially (because it is immediately available), super-phosphate of lime, *i. e.*, bone-dust acted on by sulphuric acid, is a cheaper source of phosphoric acid for plants than guano; and we do not think that the use of the latter will ever drive the former out of the market. In ordinary circumstances, *i. e.*, if your land is not altogether worn out, we should prefer using bone-dust or superphosphate of lime to guano as a manure for Turnips.

BURNING EARTH.—*Subscriber.*—Please to state your question more in detail. We do not understand to what you allude.

GUANO AND BONE-DUST.—*A Farmer.*—2 cwt. of the former, and 1 quarter of the latter, will be a sufficient dressing for an acre, for Turnips. 20 or 30 bushels of old coal and wood-ashes will make a good compost with the same quantity of guano, for an acre of land.

GYPSUM.—*E. R.*—Sow six bushels of the powder per acre, broadcast by itself, in wet weather. It will probably act beneficially on your aftermath, if the weather be suitable. Sulphuric acid, 1 gallon to about every 40 of urine, is the best fixer of the ammonia in liquid manure.

LINSEED.—*J. C.*—The seed crushed and given by itself is too rich. We shall publish a communication on this subject shortly. A manure is valuable in so far as it supplies what the plant wants, and the soil does not contain. A consideration of this will convince you that it is impossible to say whether soaper's ashes or farm-yard manure will answer your purpose best. The latter is most likely to be best, as it contains a greater number of the substances plants require as food. Can any of our correspondents give us their experience of soaper's ashes as a manure?

MARE AND FOAL.—*No.* 5.5.7.—Can any one inform our correspondent how he may best rear a foal on cow's-milk, or induce its dam to take to her offspring?

PEAT.—*G. Williams.*—The beneficial effects which have attended the application of clay and lime on peaty soils point them out as the best correctives of such soils. It is not probable that salt would have much influence in a district so near the sea.

POISONOUS PLANTS.—*X.*—States that he has had in Westmoreland two sheep very suddenly poisoned in a field where such an occurrence was never known before. On examining the field minutely, no poisonous plant can be found except Arum maculatum, of which there is a patch under a wall, looking green and tempting, while the field is completely burnt up and destitute of herbage. It was near this that the sheep were lying dead. He adds, that a gardener to a neighbouring gentleman stated, on the subject being named to him, that they had lost both cows and sheep at different times, as they believed, from the same cause. We do not wonder at it, for this Arum is an acrid poisonous plant, and will have its venom much concentrated in such a season as this. It is absurd to talk of the red spider being the cause; the opinion is not the better for being very popular.

POTATOES.—*A Potato Fancier.*—We must refer you to the numerous communications of correspondents on this subject.

POULTRY.—*J. B. C.*—We cannot speak from experience about the Muscovy duck. All our knowledge of this fowl is derived from a work to which we have referred in another column, "Farming for Ladies;" which, however, does not answer your question.

PULVERISING CHALK.—*W. W.*—Lay it down as road material, where your carts are passing and repassing; this will break some sufficiently small.

SALTPETRE.—*A Subscriber.*—You are, in all probability, wrong in attributing the failure of your Potato crop to the nitre in your saline manure. The saltpetre was the most valuable ingredient in the manure you applied. The weather, &c. are sufficient to account for the failure of your crop. Your fate in this respect is not this year a singular one.

SMALL FARMS.—*An Enquirer*, observing a communication from "Senex" respecting 4½ acres of land, is anxious to know—1st, the annual amount of labour employed by him upon it (that is to say, whether it is full employment for one or more hands); and 2d, the amount of and the value of the produce, with the number and description of stock it will maintain.

STEEPING SEEDS.—*J. B. C.*—The small quantity of inorganic manure thus administered is *supposed* to be influential on the future plant, by giving it a vigorous start in life, and by hastening it through that period when it is peculiarly liable to injury from insects, &c.

SUBSTITUTE FOR GUANO.—*A Constant Reader* asks Mr. Dimsdale what quantity of lime and sulphate of magnesia should be added to urine in order that the efficiency of his artificial guano may be greatest. We have no hesitation in saying that the addition of caustic lime at all to the liquid is wrong in principle, and calculated to volatilise some of its most valuable constituents.

WEEDS.—*Spade and Anchor.*—Your weed, Genista tinctoria, must be dug out; that is the only way to destroy it. We should be glad to publish any instances in which your experience has proved the accuracy of our advice.

WHEAT.—*J. C. M.*—The production which is affecting your Wheat is not the true mildew, nor indeed at all nearly allied to it, but is of the same genus as the Hop-mould, which is sometimes so destructive. It is a peculiar form of Erisiphe communis, and is by no means confined to Wheat, but far more common on broad-leaved Grasses. It is, however, not unusually observed on the different kinds of Corn in close damp corners, but in these cases rarely produces fructification. It usually makes its appearance later in the year, and is generally confined to the leaves and sheaths, and consequently is not so injurious as those species which attack the stem. We shall be obliged by your examining the progress of the disease, and forwarding specimens in the course of a fortnight or three weeks, especially if it extends to the stem or ears. We shall also be obliged by your informing us whether it affects the produce of the crop or not. Your specimens are not quite mature, as the fructifying bodies are not yet developed. The structure of the young plant under the microscope is quite different from that of mature individuals, and the two states have consequently been referred to two different genera. After we have received additional information, we shall probably take an opportunity of again adverting to the subject.—*M. J. B.*——*Subscriber.*—With regard to rust, mildew, &c., we hope to publish on the subject soon.

WILL, CONSTRUCTION OF.—*J. B. W.*—We cannot undertake to answer this question satisfactorily without seeing the Will, or a sufficient extract. If the subject-matter of the devise were pasture land, and the restriction were against ploughing it, such a restriction would extend to spade husbandry; but the question as put does not sufficiently give the facts of the case. You should consult your solicitor.—*W.*

*** As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, June 10.—Per stone of 8 lbs.

Best Scots, Herefords, &c.			3s	6	to 3s	10	Best Downs & Half-breds	3s 8 to 3s 10
Best Short Horns	-	-	3	4	3	8	Best Long-wools - -	3 6 3 8
Second quality Beasts	-	-	2	10	3	2	Ewes and second quality	3 0 3 4
Calves	-	-	3	6	4	2	Lambs - - -	4 0 5 0
Pigs	-	-	3	4	4	0		

Beasts, 3082; Sheep and Lambs, 35,650; Calves, 178; Pigs, 390.

We have to-day a large supply of Beef, and a very great many remain unsold. The prices above quoted—namely, 3s 10d for Scots, and 3s 8d for Short-horns—are extreme quotations, a great many of excellent quality having made fully 2d per 8 lbs less, still, several of the choicest have realised those prices. The supply of Sheep is larger than has been known for a very long period, owing to the scarcity of keep; they are also, from the same cause, of middling quality; there is, consequently, a fair demand for the very best, but everything suffers a reduction in price. Veal-trade is excessively bad, and very few Calves make over 4s. per 8 lbs. Pork-trade is heavy.

FRIDAY, June 14.

Our supply of fresh Beasts is not very large, but with what were turned out on Monday, it is more than adequate to meet the demand. Trade is very heavy, at about the same rates as Monday, 3s 8d being the more general price for Scots, and 3s 6d for Short-horns. There is a little briskness in the Mutton-trade, but prices are no better. Lambs are selling rather more freely, and the best are making about 5s 4d per 8 lbs. We have a large supply of Veal, but there is rather more demand for the best qualities, which make about 4s 4d. Pork remains about the same.

Beasts, 610; Sheep and Lambs, 11,090; Calves, 425; Pigs, 387.

41, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, June 10.

Our season is fast drawing to a close, unless some good-conditioned lost could be procured, which might protract it beyond its usual time. The long continued drought has considerably retarded all the early crops in the suburbs of London, consequently old Potatoes are still wanted. There have been arrivals from the various shipping districts during the past week, and the best samples were in great request, and a further advance was effected on all descriptions, and at the close the following prices were well supported.

Dutch Whites are selling at 50s to 55s.

York Reds	- - -	90s	to 100s	Essex and Sussex Blues		—s to —s
Perth	- - - -	85	90	Wisbeach Kidneys	- -	— —

Cornwall	- - - -	—	—	Jersey and Guernsey Blues		70 80
Sussex Whites	- - -	—	—	Prince Regents	- -	— —
Kent and Essex Kidneys		80	90	York Shaws	- -	— —

MARK-LANE, MONDAY, June 10.

The Market this morning was moderately supplied with English Wheat by land carriage samples, nevertheless the trade opened dull, and the best qualities could not be disposed of, excepting at a decline of fully 1s. per qr.; the secondary descriptions met a slow sale, at rates barely equal to those of this day se'nnight, and some quantity of both remains unsold. There was a fair retail inquiry for Free Foreign, on the terms of last week. In Bonded we did not hear of anything doing.—Barley and Beans are unaltered in value.—Peas of all sorts are 1s. dearer.—Oats sell freely, and fully maintain the quotations of last week.

BRITISH, PER IMPERIAL QUARTER.	s.	s.		s.	s.

FRIDAY, June 14.

The arrivals of English Wheat since Monday have been larger than usual, and the trade is exceedingly heavy at that day's prices. Fresh Free Foreign meets a fair demand, and fully maintains its late value.—Barley, Beans, and Peas are severally held for an advance, and the quantity offering is limited; the f. o. b. inquiry for these articles continues.—The sale of Oats is less brisk than it has been, owing to their being held for more money.

KINGSFORD AND LAY.

HOPS, FRIDAY, June 14.

The Hop Market continues about the same as last week; and with the exception of Midd. Kent, the vermin and Honey-dew keep increasing on the Bines. The Lowlands are fast going into blight.

PATTENDEN & SMITH, Hop-Factors.

COVENT GARDEN, JUNE 15.—Grapes continue on the increase; they are good in quality, and have not altered much in price. Spanish ones are almost over for a season; a few may, however, still be met with in the market, but they are not of good quality. Little alteration has taken place in the prices of Pines since our last report; they are rather more plentiful. Melons are good and sufficient for the demand; some foreign ones are in the market. Of Peaches and Nectarines there are a few good specimens. Cherries have been imported in considerable quantities, and are in consequence rather lower in price. There are fine samples of Strawberries in the market; they are now beginning to get more abundant. A few dessert Apples and Pears may be met with, but they are scarcely worth quoting. Green Gooseberries and Currants are in abundance. In consequence of the long dry weather, Vegetables in general are not so good in quality. Among them, however, we noticed some excellent heads of Cauliflower, and Asparagus is good and sufficient for the demand. Carrots and Turnips are small, Rhubarb has not altered since our last report; French Beans are a little dearer; Peas are abundant, as are also Lettuces; almost all kinds of Salading are cheap and plentiful. Among Cut Flowers were Heaths, Gardenias, Lily of the Valley, Carnations, Pinks, Sweet Peas, Pelargoniums, Fuchsias, Verbenas, Moss and other Roses.

FRUITS.

Pine Apple, per lb., 6s to 10s
Grapes, Spanish, per lb., 1s to 1s 6d
Hothouse Grapes, per lb., 4s to 8s
Melons, each, 5s to 10s
Peaches, per dozen, 12s to 30s
Cherries, per lb., 7d to 5s
Currants, per half-sieve, 2s to 3s 6d
Strawberries, per gallon, 1s to 2s
Gooseberries, per hf.-sieve, 1s 6d to 3s

ENGLISH TIMBER AND BARK.—JUNE 10, 1844.

Round Timber, per load.			Plank, per foot cube.		Inch board, p ft. sup'l.
Oak . .	5l 10s	to 8l 0s	3s 0d to 5s 0d		4½d to 6d
Ash . .	5 5	7 15	2 6	4 6	3 4
Elm . .	3 0	4 0	1 9	2 3	2 3
Beech . .	2 10	3 0	1 9	2 0	2 2½
Lime . .	3 10	4 0	2 0	2 3	2½ 4½

Oak Bark (per load), 16l. to 18l. J. S.

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7s. per cwt. Phosphate of Potash, 15s. per cwt.
" Soda 12s. "
" Magnesia 9s. "
" Ammonia 1s. per lb.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL; And by their Agents, COTESWORTH, POWELL, AND PRYOR, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL. 47, Lime-street, June 14, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Billiter-street.

ARRIVAL of the "GOLDEN SPRING," from Ichaboe, with a Cargo of first-rate GUANO.—The Barque "Golden Spring," Capt. POOLE, of 500 tons burthen, has just arrived in Plymouth Sound, with a full Cargo of first-class GUANO, wholly laden at the Island of Ichaboe.—Prices and particulars on application to WILLIAM E. RENDLE, for Plymouth Manure Company.

Plymouth Manure Company's Office, Union-road, June 5.

TURNIP SOWING.—BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9l. per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town.—Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones . .	p. ton	£4	10s.	0d	Nitrate of Potash	" £1	4s.	6d
" crushed,	5l. 10s. to	6	0	0	Oil of Vitriol, or Sulph. acid . .	p. lb.	0	0	1
" calcined . .		7	0	0	Rape Cakes .	p. ton	4	15	0
Carbonate of ammonia . .	p. cwt.	2	16	0	Salts, Epsom	"	9	0	0
Guano, Peruvian,	p. tn.	11	0	0	" Glauber	"	7	0	0
" Ichaboe	"	9	0	0	Sulphate of Ammonia, per cwt., 16s. to		0	17	0
Gypsum . .	"	2	0	0					
Nitrate of Soda, p. cwt.		0	14	9					

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5l. to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2s. 6d. and 4s. 6d., with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1s. 6d. each, and in bottles, six times the size, at 7s. 6d. The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs in.

IMPORTANT TO FLORISTS, HORTICULTURISTS, AND OTHERS.

TANNER'S VITREOUS FLUID and CLOTH, being a SUBSTITUTE for the GLAZED FRAMES of HOTBEDS and CONSERVATORIES, &c.

The Proprietor, in introducing the above Preparations, feels confident a very important desideratum is presented to the Public, combining utility and economy.

A Conservatory or Greenhouse may be built at a very moderate cost, with all the advantages of Glazed Frames. A Forcing-bed covered with this cloth is not only less expensive, but yields many other advantages—not requiring the attention of the ordinary kind, admitting a more genial light, preserving a uniform dewy moisture on the Plant, maintaining, without any other covering, a moderate temperature under the strongest rays of the mid-day sun, and the atmosphere requires only to be changed from time to time according to circumstances. It affords a certain Protection for Fruit-trees, either from Frost, Blight, or excessive Heat, affording abundance of Light and Heat, for the expansion of the blossom, causing the Fruit to set and swell more freely, and much earlier.

The attention of the Nobility and Gentry is respectfully solicited to the above, which being Waterproof, and varying in texture, will prove equally suitable for Marquees, Blinds, covering Market Carts, Vans, &c.

Merchants and the Trading Classes will also find the above adapted for the Windows of Offices and Workshops, admitting a more agreeable light than glass.

Hand-Frames of various sizes, covered with the Vitreous Cloth, may also be obtained of the Proprietor, and Agents.

Manufactured and sold by N. W. TANNER, Chemist, Exeter.

Directions for Use of Fluid with each Bottle.

Any persons residing in large towns or cities, desirous of becoming Agents, are requested to make early application.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10l. per ton, or 12s. per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, having made further experiments, is able to reduce the price of the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, which is far superior to the foreign green glass—to 5s. 6d. each, or 3l. per dozen.

AGRICULTURAL SALT.—About 20 Tons to be SOLD at the very low price of 20*s.* per ton, delivered into the purchaser's barge or waggon.—Apply by letter, or personally, to Mr. STEELE, Tar Works, Bow Common, Middlesex.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade.
THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

70, STRAND, LONDON.

RAMS FOR RAISING WATER WITHOUT LABOUR, WHERE A FALL CAN BE OBTAINED,

FOUNTAINS of every description. Specimens of the Fountain to be seen at the above address.

Also a Ram fixed on the premises. F. ROE, 70, Strand, London.

Every kind of Garden and other Pumps, Well Engines, &c.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

TO BE LET, with Immediate Possession, a Small, Genteel House, with Half an Acre of Garden Ground, well stocked with Fruit-trees. Likewise Two Hot-houses, 70 feet long by 15 wide; with good crops of Grapes near colouring, and various Plants. The House and Ground Rent 15*l.* per annum. The reason for disposing of the above is on account of leaving the country. It will suit any Gardener that wishes to commence business for himself, with a small capital.—For particulars apply to Mr. J. MOSES, Enfield Highway, Middlesex.

RESIDENCE & SPORTING WANTED to RENT, Furnished.—The House must be conveniently capable of accommodating a moderate-sized Family of the highest respectability, and with a right of Sporting attached; if with a small Farm would prove no objection. Any gentleman seeking a permanent and desirable tenant may with confidence address particulars to Messrs. HEDGER, Land Agents, 10, New Bond-street, opposite the Clarendon.

WANTED, at MICHAELMAS NEXT, for 7, 14, 21, or a longer number of years, a FARM-COTTAGE and 300 or 400 acres of GOOD LAND (more but not less will be taken), in any of the following counties:—Devon, Wilts, Somersetshire, Cornwall, Kent, Surrey, Middlesex. No conditions agreed to but to farm in the best style, pay for the incoming crops, and reference to assure the rental being paid half-yearly.—Address O. O., Office of this Paper.

WORKS ON NATURAL SCIENCE

PUBLISHED BY

WM. S. ORR & Co., Amen Corner, Paternoster-row.

PAXTON'S MAGAZINE OF BOTANY, in Ten vols. royal 8vo, price 13*l.* 10*s.*, half-bound morocco, and containing upwards of 450 Illustrations of the most beautiful Flowering Plants introduced during the last ten years, beautifully coloured, after the finest specimens; with their Botanical Descriptions, Natural History, and Directions for their Cultivation.

CUVIER'S ANIMAL KINGDOM; medium 8vo, price 18*s.*; or with Landseer's Etchings, price 25*s.* cloth, lettered. Translated from the best French Edition, and brought down to the present state of science.
The MAMMALIA, BIRDS, and REPTILES, by Mr. E. BLYTH.
The FISHES, by the late Mr. MUDIE.
The MOLLUSCA, by GEORGE JOHNSON, M.D.
The CRUSTACEA and INSECTS, by J. O. WESTWOOD, F.L.S.

THE BRITISH CYCLOPÆDIA of NATURAL HISTORY; in 3 vols. sup.-royal 8vo, price 2*l.* 5*s.* cloth, or 2*l.* 11*s.* half-bound morocco. The articles were contributed by Messrs. MUDIE, WESTWOOD, BLYTH, MAIN, and many other writers of reputation; and the Work presents, under its Alphabetical arrangement, Treatises on every branch of Natural History.

WHITE'S NATURAL HISTORY and ANTIQUITIES of SELBORNE. Price 5*s.* 6*d.* cloth lettered, With Notes by Mr. EDWARD BLYTH, a Map of the Locality, beautifully engraved on Steel, and an interesting account of the present state of Selborne, written during a visit to Selborne in 1836, by Mr. MUDIE.
London: Wm. S. ORR & Co., Amen Corner, Paternoster-row.

CYCLOPÆDIA OF NATURAL SCIENCE. By W. B. CARPENTER, M.D., F.R.S., Lecturer on Natural History and Comparative Anatomy at St. Thomas's Hospital.

VEGETABLE PHYSIOLOGY and BOTANY. Price 10*s.* cloth lettered; or each Part separate, price 4*s.* 6*d.* sewed. Elementary Treatises, adapted equally for the instruction of those who have no previous knowledge of the subject, or as a text-book for the more advanced students. A New Edition, carefully revised and much enlarged by the Author.

MECHANICAL PHILOSOPHY, HOROLOGY, and ASTRONOMY. Price 9*s.* 6*d.* cloth lettered, or 4*s.* 6*d.* in Parts, exhibiting in the FIRST Part the highest principles of science in their connexion with each other and with the phenomena they govern, and in the SECOND, their application to astronomical purposes, and to the admeasurement of time.

ANIMAL PHYSIOLOGY. Price 10*s.* 6*d.*, cloth lettered, or in Parts 5*s.* each, sewed. Combining with the general principles of Physiology and Comparative Anatomy details suited to the general reader, and calculated to teach him not only *what is*, but *why it is so*.

ZOOLOGY and INSTINCT of ANIMALS. To be completed in 2 Vols. Price 10*s.* 6*d.* each. cloth lettered, or in Four Parts 5*s.* each, sewed, exhibiting the general principles of classification, with such details of habit or locality as will interest the general reader; with reflections on the most interesting instances of instinct in animals.
London: Wm. S. ORR & Co., Amen Corner, Paternoster-row.

Just published, the Second Edition.

A PRACTICAL TREATISE on the IMPORTANT VALUE of PERUVIAN and ICHABOE AFRICAN GUANO, the most powerful, portable, and cheap Manure in the World. Interspersed with appropriate Rules, and Application of Genuine Guano, arranged for all soils, growth, and rotation of Crops. To be had of the Author only, by letters prepaid, inclosing 1*s.*, when a Copy will be posted prepaid.

All letters to be addressed to W. A. HARWOOD, 50, Chester-st., Birkenhead, near Liverpool. N.B. Genuine Guano ex ship, 11*l.* to 12*l.* per ton; orders for 2 cwt. and upwards executed.

SATURDAY, JUNE 15, 1844.

VICTORIA LIFE ASSURANCE COMPANY.—*Trustees.*

Sir Jas. Duke, Ald., M.P., Chairman.
Benjamin Hawes, Esq., Deputy Chairman.
Benjamin Barnard, Esq. | Charles Baldwin, Esq.

Peculiar advantages are offered by this Company. Thus—

Parties assuring the lives of others may make their policies secure, notwithstanding the life assured may go out of the limits of Europe, without the necessary permission of the Directors having been previously obtained.

Credit of half the premiums for the first five years allowed on policies effected for the whole term of life.

On policies of five years' standing, half the amount paid, after the first year's premium, may be borrowed thereon by the Assured.

Advances made to assurers on real or undoubted personal security, for terms of years, re-payable by instalments.

Attention is particularly requested to the detailed prospectuses of the Company, which may be obtained at the Office, 18, King William-street, City, or by letter, addressed to the Secretary.

WILLIAM RATRAY, Actuary and Secretary.

PROVIDENT LIFE OFFICE, 50, REGENT STREET, FEB. 15, 1844.
BONUSES DECLARED, 529,306*l.* 17*s.* 7*d.*

NOTICE is hereby given, that all Persons who hold Policies in this Office may receive the present value of the Bonuses which have been added to their Policies, upon application at the Head Office, or to the Agents through whom the Policies were issued. GEORGE BEAUMONT, Actuary.

BEE-HIVES.—GEORGE NEIGHBOUR & SON beg to inform their Apiarian friends that they have prepared for the season a large supply of "Nutt's Patent Bee-hives" (for the sale of which they are the only authorised agents), in which are embodied all the recent improvements. Their selection now comprehends most varieties in general use at the present time, including the "Single Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with glasses, &c., from either of which the produce may be taken at any time of the gathering season, without destroying the Bees.

G. N. & SON have also Glass Hives, and other articles connected with Bee management, a catalogue of which, with drawings, may be obtained. Letters of inquiry must have postage stamps inclosed.—Apiarian Depot and Honey Warehouse, 127, High Holborn, London.

NUTT ON BEES, Fifth Edition, now Published.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*; Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d.* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

A LUXURY FOR WARM WEATHER.
LIGHT SUMMER FROCKS.

BERDOE'S SUPERIOR WATERPROOF FROCKS. An extensive variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

NECESSARY PRECAUTION.—CONSUMERS of BRANDY are respectfully informed that J. T. BETTS, jun. and Co. will not be responsible for any bottled Brandy that is not protected against fraudulent substitution, by the Patent Metallic Capsules, embossed with the words, "Betts's Patent Brandy, 7 Smithfield Bars." Sold by the most respectable Wine and Spirit Merchants, in Town and Country, at 3*s.* 6*d.* per bottle the bottle included.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

DESTRUCTIVE ANIMALCULÆ.

DURING the Summer Months the larvæ of destructive Insects are propagated in infinite multitudes, and with amazing rapidity (and impregnate with millions of Insects the very air we breathe), to the great injury of the young shoots of Trees, Vines, Plants, and every species of vegetation put into motion and growth by the genial influence of the season.

J. READ begs to inform Noblemen, Gentlemen, Nurserymen, &c., that he has recently invented a new HYDRAULIC MACHINE for the purpose of subduing these destructive insects, which make such deadly havoc on all fruit-trees and plants at this season of the year. These machines are made of various dimensions, suitable for every purpose of Horticulture, and also for extinguishing fire at its first breaking out. The valvular action is so constructed that they can never get out of repair, and are ready to act in an instant.

WOLLASTON'S PATENT GELATINE. For immediately making Jellies or Blanc-mange, being quickly dissolved in boiling water, it is of equal strength with the finest Russian Isinglass, and perfectly free from any unpleasant taste or smell, requiring less flavouring than any other preparation of Gelatine or Isinglass, being a perfectly pure, colourless, and soluble substance. For Jellies, it will not be found necessary to use Eggs, as passing through a flannel bag is sufficient. Invalids will find this a very nourishing and valuable restorative, from the great facility and readiness with which it is used, and not being liable to become sour so soon as Isinglass.

Manufactured and sold by EDWARD L. WOLLASTON, Dover, and retailed by all respectable Druggists, Grocers, and others, at 8*s.* per pound.

BEES.—After near 40 years' experience in the study and Management of Bees, the Hive which Mr. SAVAGE, of Swaffham, has introduced to the Apiarian World, is certainly better adapted than any other Hive ever yet invented, for the reception of any superfluous store collected, it being also easier in its deprivation at any time of the season. And the neatness and durability of its construction defies the admission of insects of every description. It is well worthy the attention of the Nobility, and every friend of humanity.—GEORGE PAYNE.

AGRICULTURE, COMMERCE, NAVIGATION, the CHURCH.—A. B. SAVORY and SONS, GOLDSMITHS, 14, Cornhill, London, opposite the Bank, have finished a few Splendid Pieces of PLATE, suitable for Presentation to Gentlemen connected with either of the above pursuits or professions, to which they invite the attention of committees who are in search of valuable testimonials for such occasions.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June 6,* 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage to any climate. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette,* April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester; Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

Removed from Birmingham to 19, Berners st, Oxford-st, London. Just published, the Thirteenth Edition, price 2*s.* 6*d.*; free by post, 3*s.* 6*d.*,

THE SILENT FRIEND on NERVOUS DEBILITY, CONSTITUTIONAL WEAKNESS, &c. By R. and L. PERRY and Co., Surgeons, London. Published by the Authors, and sold at their residence; also by Strange, 21, Paternoster-row; Noble, 109, Chancery-lane; Crocker, 1, Milford-lane, Strand; Ward, 103, Strand (opposite Exeter Hall); Gordon, 146, Leadenhall-st.; Purkiss, Compton-st., Soho; Wilson, 338, Oxford-st. (two doors from Argyll-st.), London. The Cordial Balm of Syriacum is a stimulant and renovator in all Spasmodic complaints. Nervous Debility, Indigestion, Asthma, and Consumption, are gradually and imperceptibly removed by its use, and the whole system restored to a healthy state of organisation. Sold in bottles, price 11*s.* and 33*s.* PERRY'S Purifying Specific Pills have long been used as the most certain remedy for Scorbutic Complaints of every description, Eruptions of the Skin, Pimples on the Face, and other disagreeable affections, the result of an impure state of the blood. These Pills are perfectly free from mercury and other deleterious drugs, and may be taken with safety without interference with, or loss of time from business, and can be relied upon in every instance. Sold in boxes, at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by all Medicine Venders.

Messrs. PERRY and Co. may be consulted daily at their residence, 19, Berners-street, Oxford-street, from 11 till 2, and from 5 till 8. On Sunday, from 10 till 12.

News of the Week.

THE leading topic of our foreign news is the announcement that a collision has taken place between the French troops and the forces of the Emperor of Morocco. The French were completely victorious, putting a large body of Moorish cavalry to the rout, and capturing three standards. In Paris this affair is regarded as the commencement of actual hostilities, although Marshal Soult in the French Chambers, and Lord Aberdeen in the House of Lords, have declared their conviction that war will not take place. The French Government, however, are strengthening their position on the Morocco frontier, and a squadron of line-of-battle ships and steamers has been equipped, under the command of the Prince de Joinville, for the purpose of cruising off the eastern coast of Morocco. The Moors are evidently collected in large numbers, and are animated by a hostile spirit which the efforts of diplomacy may find it difficult, if not impossible, to control. The recent skirmish at Ouchda was caused by the impetuosity of the native troops on first approaching the French camp; and a few days previously the French garrison at Biskara, which the Duc d'Aumale had left without sufficient protection, was treacherously massacred. The movement is known to be the work of Abd-el-Kader, who has so successfully inflamed the religious fanaticism of the Moors, that the Emperor is said to have been unable to resist the impulse given to his people by the old enemy of France, and was, therefore, compelled to proclaim the "holy war." If this be confirmed, there are reasons to hope that the mediation of England, which Lord Aberdeen is understood to have offered, will be accepted, and thus avert a war which might seriously compromise the relations between this country and France.—From Spain we have accounts of the arrival of Queen Isabella and her mother at Barcelona, and of the reception prepared for them by the citizens. The Prince di Trapani was expected to arrive in a few days from Naples, and as Sir R. Peel has announced in Parliament that the project of marrying the Queen to the son of Don Carlos has met with no encouragement from our Government, there is little doubt that the Neapolitan Prince will be a successful suitor.—From Germany we learn that the long-expected death of the Duc d'Angoulême took place at Goritz on the 3d. The French papers, including those opposed to his Royal Highness in politics, pay a just tribute to his personal virtues, and the French Court, it is said, will go into mourning on the occasion.—From Italy we have intelligence of a startling character, announcing that some of the most illustrious families of Rome are compromised by the late events, and that the spirit of disaffection is daily becoming more alarming in the Papal States. According to these accounts, the Prince Doria Pamfili, the Prince Piombino, and other persons of rank, have been obliged to leave Rome. If this statement be true, it proves, in connexion with the recent desertions in the Austrian Navy, that the discontent is widely spread through all classes of Italian society.—From the United States we have further accounts of the negotiation for the annexation of Texas, which now occupies the attention of the Senate. A long correspondence had taken place on the subject, and President Tyler, in answer to an inquiry by the Senate, had admitted that his treaty with Texas was negotiated without the knowledge or consent of Mexico.

The Emperor of Russia left England on Sunday, and is now probably in his own dominions, after a rapid visit to the Court of Holland. For the particulars of His Majesty's movements during the last week of his residence in England, we must refer the reader to our Home News, where are also recorded the movements of the King of Saxony, and of the two other foreign princes who are at present visitors to our shores.—In Parliament during the week there have been many subjects of interest. In the Lords, on Tuesday, the Government were defeated on the question of uniting the ancient sees of St. Asaph and Bangor for the purpose of creating a see of Manchester; and the second reading of Lord Powis's Bill to repeal so much of the Act of 1836 as provided for the union of those sees, was carried by a majority of 12. On Thursday, Lord Monteagle brought forward his motion on the Import Duties, with the view of extending the principles of free trade, but the motion was negatived by a majority of 109. In the Commons, on Monday, Mr. Ewart's motion for the Equalisation of the Sugar Duties was negatived by a majority of 203; and on Wednesday, Mr. Ward's motion on the Temporalities of the Irish Church, after two nights' debate, was negatived by a majority of 95. On Thursday, the Bank Charter Bill was read a second time, after a division on Mr. Hawes's motion against the proposed interference with banks of issue, which was negatived by a majority of 155. And this morning, at 2 o'clock, Ministers sustained their 2d defeat this week, by being left in a minority of 20 on the Sugar Duties Bill.

Home News.

COURT.—Her Majesty and Prince Albert, the Prince of Wales, and the Princesses, arrived in town on Friday from Windsor Castle, accompanied by the Emperor of Russia and the King of Saxony. On Saturday evening the Queen and her Royal visitors honoured the Italian Opera with their presence, the Prince having previously accompanied the Emperor of Russia and the King of Saxony to the *fête* given by the Duke of Devonshire at Chiswick. On Monday the Prince presided at the distribution of the prizes voted to the successful candidates at the Society of Arts, and on Tuesday H. R. H. laid the foundation stone of the new Hospital for Consumption in the Fulham-road. On Tuesday evening the Prince accompanied the King of Saxony to the Italian Opera. The Queen during the week has taken her daily walk in the Palace Gardens. It is announced that the accouchement of her Majesty will take place at Windsor Castle. Her Majesty is expected to arrive at the Castle on Monday the 1st July, or the following day. Dr. Locock, first physician-accoucheur to the Queen, will proceed to Windsor in attendance upon her Majesty, when the Court takes its departure from Buckingham Palace. Dr. Locock will take up his residence in the town during the period of his attendance upon the Queen. It is expected that Sir J. Clark, her Majesty's physician, will take up his abode during his temporary *séjour* at Windsor, at the official residence of the Rev. D. Markham, one of the canons, in the Cloisters. The Duchess of Kent is expected to return to Frogmore House from the Continent on the 1st July, by which time the extensive alterations in the interior of the mansion made by the order of the Commissioners of Woods and Forests during the absence of the Duchess will be completed. In consequence of the superior salubrity of the neighbourhood north of Hyde-park, more particularly as regards the health of children and elderly persons, it is said to be in contemplation to purchase one of the houses on Westbourne-terrace, as a dormitory for the Royal infants during her Majesty's residence at Buckingham-palace.

THE EMPEROR OF RUSSIA.—The Emperor, attended by Baron Brunnow, went on Saturday to the United Service Club. His Imperial Majesty inspected the different saloons, and went all over the house, familiarly conversing with those who attended him, and astonished the cook in the kitchen by courteously asking him how he cooked roast beef? The Emperor then proceeded to the New Houses of Parliament, where he was met by Prince Albert and the King of Saxony. His Majesty took the highest interest in the progress of the works, minutely examining the quality of the stone and its workmanship; and was much struck with the regularity and orderly procedure of the immense body of workmen. The Emperor, having taken a view of the river front, ascended the temporary staircase at the Victoria Tower, and having walked for a considerable distance upon the unprotected walls of the Victoria gallery, examined the

interior of the new House of Lords, which is now just ready to receive the roof, passing over the ordinary scaffolding to the house lobby and central hall, from whence they proceeded to the model and sculpture rooms. His Majesty evinced the liveliest interest in the whole of the works, and conversed with Mr. Barry upon the design and arrangements of the various parts. His Imperial Majesty, attended by Baron Brunnow, afterwards went to Montagu-house, to visit the Duke and Duchess of Buccleuch, and returned to the palace at 12 o'clock. The Duke of Wellington arrived at the palace soon after 12, to have an audience of the Emperor. The noble duke was dressed in a Russian uniform, and wore the insignia of the Garter and of the Golden Fleece. The Emperor of Russia, the King of Saxony, Prince Albert, and their respective suites, left the palace at a quarter past 1, to honour the Duke of Devonshire with their company at the grand *fête* given by his grace at his villa at Chiswick. The royal party occupied five open carriages and four, and were escorted by a party of Lancers. About 700 members of the principal noble families in the kingdom were present on the occasion. Upon the Royal *cortège* entering the grounds, the Russian Imperial standard was hoisted on the summit of the mansion, the Royal standard floating at the same time over the arcade leading to the Italian gardens. As the Royal party approached the grand entrance, a Royal salute was fired from a battery within the grounds, the bands playing the Russian national hymn. Upon the Emperor alighting, he was received by his noble host and most of the distinguished guests who had already arrived. His Majesty cordially embraced the noble Duke, and bowed repeatedly to the assembled company, after which, with the King of Saxony and Prince Albert, he was conducted by his noble host up the flight of steps leading to the grand entrance saloon on the first floor of the mansion. Thence the Royal visitors proceeded through the suite of drawing-rooms to the music-saloon, where his Grace's private band were in attendance, and had the honour of performing in the Royal presence a new fantasia, composed expressly for the occasion. The Royal party remained in the music room more than half an hour, during which interval several popular airs were performed. At half-past two the Royal party left the music-saloon in the following order for the refreshment-saloon, preceded by the Duke's chief page and six of his Grace's footmen in state liveries. The Emperor took the arm of the Duchess of Sutherland, Prince Albert walking with the Duchess of Buccleuch, the King of Saxony led the Duchess of Gloucester, the Duke of Devonshire leading the Duchess of Cambridge. The Duke of Cambridge walked with Baroness Brunnow, the Duke of Wellington with the Countess de St. Aulaire, Count Orloff with the Princess Radzivill, Baron Brunnow with the Countess of Pembroke, followed by M. de Minkowitcsh and the Count de St. Aulaire. The above formed the party who had the honour of sitting with the Emperor, covers being laid for only 18. The apartment in which the royal personages breakfasted was fitted up as a tent, having the Black Eagle of Russia and the Royal arms of England emblazoned in the compartments of the roof, interspersed with the insignia of the Garter, St. Andrew of Russia, and the Duke's crest; banners of the arms of Her Majesty and of the Emperor were arranged on the walls of the apartment, and upon the palmette hangings, which formed a border to the upper portion of the walls, and were trimmed in velvet and gold, the royal initials "N." and "V." were embroidered alternately with the crowns of her Majesty and the Emperor. Over the centre on each side of the room was emblazoned the date of the day on which the *fête* took place (June 8, 1844), a fact rendered interesting by the determination of his Grace to preserve the apartment as it now stands, in honour of the Emperor's visit. The entrance to the above was through a small ante-room uniformly fitted up as a tent, communicating with the extensive suite of apartments, and entered from the lawn by a tastefully designed portico. The grounds of the mansion were in the most perfect order, and presented a beautiful appearance, the natural attractions of the spot leaving nothing that art could supply. On the opposite margin of the lake, which crosses the lawn at a short distance from the house, the four giraffes formerly exhibited in the Surrey Zoological Gardens, with their Abyssinian attendants, were placed. The banquet was of the most superb description, and the mode in which the table was decked out excited universal admiration. Along the centre were ranged a series of magnificent plateaux, filled with roses of the choicest description—that beautiful flower being alone used for the purposes of decoration in the entertainment. The fruit for the Emperor's table, of which there was a splendid display, was all obtained from Chatsworth, and excited the particular admiration of his Majesty, who expressed to his noble host his earnest desire again to visit that locality which he had so much admired 27 years since, if his engagements would have permitted him. The Emperor, contrary to his usual custom, took wine with the Duchess of Sutherland and the other ladies of the party, and at the conclusion of the repast, the Royal party retired to the lawn at the back of the mansion, where they were soon joined by a number of visitors who had partaken of refreshment in the adjoining saloons. A party was immediately formed to inspect the beautiful grounds surrounding the villa, and the Emperor leading the way with his noble host, at once proceeded under the arcade leading to the Italian gardens, which are just now seen to great advantage. Entering the conservatory, the Royal visitors inspected the magnificent collection of plants contained therein, the noble Duke pointing out to the Emperor the private walk, through which the Horticultural Society's grounds are entered from his Grace's garden. The Emperor was pleased to express his unqualified admiration of the whole arrangements, and upon leaving the conservatory proceeded down the broad walk in the centre of the Italian Garden to the Orangery. Passing thence the illustrious visitors returned through Inigo Jones's gate to the lawn, where by this time nearly the whole of the noble Duke's guests had assembled. It would be almost impossible to describe adequately the scene presented at this period by the brilliant assemblage of Royalty, rank, and fashion, here congregated. Under the branches of a magnificent Cedar-tree the Emperor held his Court, surrounded by those only inferior to himself in rank, by whom the rest of the company were successively presented to his Majesty. There was an easy freedom in the Emperor's manner, which had the effect of entirely removing any degree of constraint that might otherwise have been felt, and the most perfect enjoyment prevailed throughout the assembly. The ceremony of presentation concluded, the company dispersed in groups about the grounds—some few, among whom was the King of Saxony and his attendants, crossing the lake in boats manned by the Duke's watermen in their state liveries, for the purpose of inspecting the giraffes, which, as stated above, were placed on the opposite shore. Shortly before four, the Royal party retired into the villa, where tea and coffee were served, after which they took their departure in the order of their arrival. The noble Duke accompanied his illustrious guests to the grand entrance, where, upon entering the Royal carriage, the Emperor expressed in feeling terms the high gratification which he had derived from the opportunity afforded him by his Grace of meeting so large a number of the English aristocracy. The King of Saxony and Prince Albert also complimented his Grace on the splendour of the entertainment. In the evening, the Queen, Prince Albert, the Emperor, and the King of Saxony, honoured the Italian Opera with their presence. The opera commanded for the occasion was the *Barbiere di Siviglia*. Long before the hour for opening the doors every approach to the theatre was crowded with anxious visitants, a great proportion of whom were ladies. By eight o'clock, the hour of her Majesty's arrival, every seat in the house was occupied. Such an audience has scarcely ever been assembled within the walls of this theatre for the last quarter of a century. At the above hour, and just in time for the commencement of the opera, the Royal party with their attendants entered the royal box, and that of the Queen Dowager adjoining it. Immediately on their entrance they were greeted with a burst of cheering of the most loyal character, which each of the Royal visitants most gracefully acknowledged. The opera then commenced. At the conclusion of the first act there was a call for "God save the Queen." After a slight delay the curtain rose, when the national anthem was magnificently sung, the principal parts being taken by Mademoiselle Favanti, Lablache, and Grisi. During its performance the whole audience rose, the ladies coming forward to the front of the boxes; and the enthusiasm with which each verse was received must have given her Majesty's Royal guests a very favourable impression of the loyalty and attachment which exists between a Sovereign and a free people. "God save the Queen" being concluded, the orchestra, in compliment to his Imperial Majesty, struck up the national hymn of Russia, which was received in a flattering manner. The opera was performed with more than usual spirit, and went off with the utmost *éclat*. The Royal party repeatedly and warmly joined the audience in the enthusiastic applause which Grisi received, and the other principal performers, Lablache, Mario, and Fornasari, received a due share of approbation. Between the acts of the opera Cerito danced "La Marola," the Arragonese dance which she has lately introduced, and which she executes with infinite grace and expression. Her Majesty, accompanied by her Royal guests, retired before the commencement of the ballet. On Sunday morning the Emperor, dressed in the splendid uniform of the Imperial Guard, attended divine service in the chapel in Welbeck-street, accompanied by Baron Brunnow and his suite. In the afternoon the Emperor, attended by Baron Brunnow, honoured Sir R. Peel, the Dowager Countess of Pembroke, and Baroness Brunnow, with a visit. His Imperial Majesty returned to the Palace at four o'clock, and afterwards gave audience to the Duke of Devonshire. After partaking of luncheon with her Majesty, the Emperor took leave of the Queen and great Officers of State, and proceeded to Woolwich, accompanied by Prince Albert, the Lords of the Admiralty, Lord Aberdeen, &c. The Emperor having expressed a desire to inspect the dockyard during the period occupied in shipping the luggage and carriages on board the Lightning steamer, Sir F. Collier had the honour of conducting his Majesty and his suite through the establishment. The Royal party proceeded to the factory, where, although everything was perfectly quiet, his Majesty had an opportunity of witnessing the magnitude of the works. The Emperor made repeated inquiries as to the uses and power of the machinery, and upon leaving expressed himself highly gratified. Thence his Majesty proceeded in company with Prince Albert to the western slip, on which the Royal Albert, 120-gun ship, is now in progress. Mr. Lang, the master shipwright, had the honour of explaining the principle on which that ship is being built. The Royal party subsequently visited the new steam dock and the other interesting objects in the dockyard; and having spent nearly an hour in the inspection, the Emperor, accompanied by Prince Albert, put off for the Black Eagle, which was lying off the dockyard, with her steam up. Upon reaching the deck the Emperor inspected the temporary saloon prepared for his reception, on the after-deck of the vessel, and expressed himself much pleased with the accommodation. The Emperor, before his departure, again took leave of the Countess of Pembroke and the Baroness Brunnow, who had come from town expressly to see his Majesty embark, and, soon after the vessel had slipped her moorings, his Majesty occupied a prominent position on the deck, saluting the ladies in the most gallant manner. Prince Albert took leave of the Emperor on board the Black Eagle. Their parting was of the most cordial character. At seven precisely the vessel let go her moorings, and dropped down the river under a Royal salute from the Dockyard, the troops presenting arms as the steamer passed. The Russian Imperial Standard floated from the mainmast of the Black Eagle, and attended by the Lightning steamer, she proceeded rapidly through Woolwich reach. Prince Albert returned to town immediately, attended by the Earl of Aberdeen and the members of his suite. The Black Eagle was commanded by the Earl of Hardwicke, and among the officers newly appointed to her for this occasion was Mr. W. Peel, son of Sir R. Peel, who took rank as first Lieutenant. Shortly before the embarkation of his Majesty, one of the sailors conveyed on board a bundle of straw, for the purpose of being used, when covered on the top with a piece of leather, as a bed for the Emperor, his Majesty preferring that simple material to the handsome couches prepared for his convenience. During his stay in Buckingham Palace, the Emperor also slept on straw, as being more conducive to health than the luxurious beds by which he was surrounded. His Majesty's munificence during his brief sojourn may be imagined from the following particulars:—to each of the principal Lords of the household (six in number), the Emperor, upon taking his departure, presented a magnificent gold snuff-box, ornamented with an enamel portrait of his Majesty, surrounded by diamonds. The equerries and groom in waiting were presented with boxes of a similar description, surmounted by the imperial cipher set in brilliants. To the three chief officers of the royal mews the Emperor presented massive gold boxes, less elaborately ornamented than the preceding. A variety of smaller gold boxes, watches, and rings, were left by his Majesty at the disposal of the Master of the Household, the Hon. Mr. Murray, for presentation to the principal domestics under his direction; while the sum of 200*l.* was given by the Emperor, to be divided among the servants employed in the departments of the Lord Steward, the Lord Chamberlain, and the Master of the Horse. At the Russian Embassy, also, a magnificent sum was left for distribution among Baron Brunnow's domestics. Colonel Rowan, Mr. Mayne, and Captain Hay, the commissioners of police, each received a handsome diamond ring, in acknowledgment of the attention shown to his Majesty's convenience; and the various officials in the office of the Consul-General were also presented with similar tokens of the Emperor's liberality. Sir F. Collier, who had the honour to steer the barge which put the Emperor ashore, was presented with a gold snuff-box, set with brilliants, and having the imperial initials in the Russian character on the lid. Commander Smith, of the William and Mary yacht, and Mr. Lang, the master shipwright of the dockyard, have each received a diamond ring, and 20*l.* has been distributed among the crew of Sir F. Collier's barge, the labourers who put the carriages and baggage on board the Lightning steamer, receiving 20*l.* among them. The Emperor also presented 1000 guineas to the Society for the relief of foreigners in distress, 500*l.* to the Nelson Monument, 500*l.* to the Wellington testimonial preparing by Mr. Wyatt, 200 guineas to the poor of St. George's parish, and 100 guineas to the German Hospital. His Majesty, on his arrival at Rotterdam, also made handsome presents to the officers and crews of the two steam-vessels—gold snuff-boxes and diamond rings being given to the officers, 350*l.* to the crew of the Black Eagle, and 150*l.* to the Lightning. The Black Eagle arrived at Rotterdam on Monday, after a delightful passage of 21 hours, the sea being nearly as smooth as a mirror all the time.

THE KING OF SAXONY.—On Friday His Majesty visited the Duke and Duchess of Sutherland at Stafford House, and inspected the New Houses of Parliament and Westminster Abbey. The Bishop of Norwich and a deputation from the Linnæan Society, had an audience of the King of Saxony on Saturday, at Buckingham Palace. The deputation consisted of Sir William Jackson Hooker, Dr. Horsfield, Mr. Forster, and Mr. Robert Brown, who were presented to his Majesty by his Excellency Baron Gersdorff and the Earl of Moreton, Lord in Waiting. His Majesty was graciously pleased to enrol his name as an honorary member of the Society. The King afterwards held a levee at Buckingham Palace, for the reception of the diplomatic corps. Their Excellencies appeared in their different uniforms and official costumes, the members of orders of knighthood wearing their respective insignia. His Majesty, after the levee, honoured the Duke of Devonshire with his company at his Grace's *fête* at Chiswick, the particulars of which have been given above, in an account of the Emperor of Russia, and in the evening his Majesty accompanied the Queen to the Italian Opera. On Sunday his Majesty attended divine service in the Bavarian Chapel, in Warwick-street, and afterwards honoured Sir Robert and Lady Peel, the Duke and Duchess of Buccleuch, and the Earl and Countess of Jersey, with visits at their respective residences. His Majesty then honoured Mr. Walker, the president of the Institution of Civil Engineers, with a visit. The models of machinery and

the numerous works of art which had been collected for his *conversazione* on Friday and Saturday evenings, were shown by Mr. Walker and the secretary, Mr. Manby, to his Majesty, who made a considerable stay, and appeared to enter with much interest into all he saw. In the evening, his Majesty, attended by his Excellency Baron Gersdorff and his suite, dined with the Duke and Duchess of Cambridge, at Cambridge House. On Monday his Majesty and his suite commenced a series of visits to a number of the institutions and public buildings of the metropolis. His Majesty first inspected Bethleham Hospital, the Tothill Fields Prison, the Milbank Penitentiary, the Thames Tunnel, the Surrey Zoological Gardens, and the Brewery of Messrs. Barclay and Perkins, and paid a visit to the Archbishop of Canterbury, at Lambeth Palace, where he partook of a *dejeûner* prepared for him. In the evening, his Majesty accompanied the Queen and Prince Albert to the Hanover-square Rooms to attend the performance of the Philharmonic Concert. On Tuesday, the King visited the Bazaar in Portman-st., the Zoological Gardens in the Regent's Park, the British Museum, the United Service Club, and the Chapel Royal, Whitehall. His Majesty also honoured Mr. Hope with a visit, at his mansion in Duchess-street, to inspect his gallery of pictures, and afterwards visited the Earl and Countess Delawarr, and the Countess Amherst. In the evening his Majesty accompanied the Queen to the Italian Opera. On Wednesday his Majesty visited the Tower of London, where he was received with military honours. After inspecting the Horse Armoury, the Record Tower, the Cavalry Armoury, and the Regalia, the King visited St. Katherine's Docks, the Royal Mint, and the Bank of England. In the evening the King dined with the Earl and Countess of Wilton. On Thursday his Majesty visited Richmond Park. His Majesty, on arriving, walked in the Park, and also promenaded on the terrace with his suite. The King then drove to Kew, where his Majesty was received by the Duke and Duchess of Cambridge, who conducted him to the Royal Botanical Gardens, where the King remained a considerable time. On the return of the Royal party to the residence of the Duke of Cambridge, a *dejeûner* was served. In the afternoon the Royal party left Kew, passing through the gardens, for Sion House, to honour the Duke and Duchess of Northumberland with a visit; the King of Saxony and the Duchess of Cambridge were in an open carriage, the Duke of Cambridge driving. The Duke and Duchess of Northumberland received their Royal guests, and conducted them through the conservatory and pleasure-grounds. After inspecting Sion House the Royal party drove to Ealing Park, where they were received by Mr. and Mrs. Lawrence, who attended their illustrious visitors through their beautiful flower-gardens and pleasure-grounds. His Majesty, attended by his suite, left Ealing Park for town, and the Duchess of Cambridge returned to Kew. His Majesty in the evening dined with the Earl of Aberdeen. His Majesty will this day honour the Horticultural Society with his presence at Chiswick, and afterwards dine with Sir Robert Peel. On Monday it is expected that his Majesty will leave town on a tour in Scotland. After visiting Edinburgh, Perth, Glasgow, Stirling, &c., his Majesty intends to make a tour of Wales, and thence come direct to the metropolis, whence the King will shortly afterwards depart for Germany.

THE CROWN PRINCE OF DENMARK.—On Monday week his Royal Highness honoured Provost Reoch with his company in Hope-street, Edinburgh, and afterwards visited Mr. Marshall, the Danish Consul General, who conducted him over the preserved meat establishment of Messrs. Gillon and Co. The Prince then proceeded to Penicuik, to inspect the paper-works of Messrs. Cowan and Co., and honoured Mr. Cowan with his company at dinner, after which he visited Roslin. In the evening the Prince dined with the Lord Justice General, and afterwards supped with Lord Murray. On Tuesday his Royal Highness set out for Perth, by way of Kinross, and after a short stay in that city proceeded to Dunkeld, where he passed the night. On Wednesday the Prince made a short tour in the Highlands by Blair Atholl, Loch Catrine, and Loch Lomond, and arrived at Glasgow on Friday. The Prince was engaged on Saturday, in company with the Lord Provost and other official gentlemen, in viewing the principal manufactories and institutions in Glasgow, and from thence he proceeded by the Caledonian Canal to Inverness. The two frigates have been ordered round to Cromarty, where his Royal Highness means to embark for the Faroe Islands.

PRINCE HENRY OF HOLLAND.—On Tuesday, Prince Henry of Holland, with a squadron of three frigates and a schooner anchored in Plymouth Sound, under royal salutes from the guardship, citadel, &c. His Royal Highness landed at Mount Wise on Wednesday, and after visiting the Port-Admiral and Commander-in-Chief, inspected the Marines and other troops who had been drawn up for the purpose. The Prince afterwards returned on board his frigate, and on Thursday was expected to visit the Dockyard and other public establishments.

Foreign.

FRANCE.—Despatches have reached Paris from General Lamoriciere, commanding the French troops on the Morocco frontier, announcing the commencement of hostilities between him and the forces of the Emperor. The French do not appear to have been the aggressors; but after a sharp skirmish at Ouchda, on the 30th, they put to the rout a large body of Moorish cavalry, and captured three standards. It is manifest, from the extensive preparations making in Paris and elsewhere, that France views this affair in a serious light, and the King, on the proposition of the Minister of Marine, has just decided that the Prince de Joinville is to hoist his flag in one of the ships of the line of the squadron of evolutions, and to proceed in her, accompanied by a steam-frigate, two smaller steamers, and several light vessels, to cruise off the eastern coast of Morocco. His Royal Highness was to leave Paris for Toulon on Sunday, to assume the command of the squadron. Previous to the arrival of the above despatches, accounts had been received of an additional cause of excitement. It appears that the Duc d'Aumale had left at Biscara a very small garrison, composed only of 3 officers, with about 40 men, from the battalion of the Constantina Fusiliers. This small corps was intended to form the nucleus of a new battalion, to be raised from among the tribes in the environs of Biscara. The new recruits opened the gates of the Casbah during the night to Mahommed Seghir, the Kalifat of Abd-el-Kader, and his followers, who surprised the men in their sleep, and killed all but one. Plunder became general, and 7000f., left with the Commandant to pay his men, and all the cannon, muskets, ammunition, and other stores, were carried off. This unfortunate affair is said to have encouraged the surrounding tribes to take up arms. In the Chamber of Deputies last week this revolt and massacre was discussed. Marshal Soult read two despatches from the Duc d'Aumale, describing the affair, and throwing the blame of it on the two officers who had been its victims, and whose neglect or want of caution would certainly appear to justify the accusation. The *National*, however, regards the charge as ungracious, disingenuous, and unfair on the part of the youthful General, and, coupling it with the late narrow escape of his Royal Highness from being made prisoner, argues against intrusting a command so important to a young man of his inexperience. Marshal Soult in the debate officially confirmed the fact of the Emperor of Morocco having declared a "holy war" against France. He said, in substance, that, driven from Algeria, Abd-el-Kader had sought a refuge in a part of the desert called the neutral territory—that he had since entered the territory of Morocco, stirred up the tribes of that empire, and inflamed their religious fanaticism to such a degree that the Emperor, unable to resist the impulse he had given his subjects, had proclaimed the "holy war." The immediate result was, that the Moors had gathered, to the number of twelve or fifteen thousand, in front of the French posts at Outjda, and that a part of the French Army had immediately been marched to that quarter.—The Paris papers still abound in speculations on the visit of the Emperor of Russia to this country, of which they still speak with singular bad temper, and seize with avidity every paragraph to be found in the London Journals conveying an idea unfavourable to the popularity of that monarch in England, or tending to encourage the belief that his reception had been cold and discourteous. They very complacently assume that the Emperor came to London to put the finishing hand to his favourite plan for delivering from Mussulman dominion the entire of the Christian states still subject to the Sultan. That Queen Victoria should have had the indelicacy to entertain the Emperor and her Majesty's other illustrious guests, in the hall of Windsor Castle, bearing the name of Waterloo, is dwelt upon with peculiar force by the liberal portion of the Paris Press!—On Saturday King Louis-Philippe gave a *fête* at Versailles to 1500 of the expositors of national industry, which went off satisfactorily. The guests assembled at half-past five in the picture-gallery of the Museum, and were allowed an hour and a half to view its treasures. At seven the doors of the theatre were thrown open, and all were admitted, without distinction of places, the simple mechanic in many places occupying the boxes, while the peer of France was glad to take refuge in the pit. The King, Queen, the royal family, all the Ministers, with the exception of Marshal Soult, a great number of the members of both Chambers, with other functionaries, were present. Immediately after the entrance of the royal family the performance, which consisted of *Œdipe à Colone*, the *Favorite*, and a part of the *Muet de Portici*, commenced. Between the acts refreshments were handed round to the guests, and at the termination of the spectacle, after loud cries of "Vive le Roi," "Vive la Reine," the party broke up.—M. Charles Laffitte, who had been a fourth time elected for Louviers, has again been unseated, the Chamber having once more decided that he was unduly returned.—Sir H. Hardinge, the new Governor of India, had arrived in Paris, accompanied by his son and aide-de-camp. He landed at Dieppe on Sunday, and immediately started for Rouen and Paris, from which place he was to go direct to Marseilles.—The King of the French has presented our countryman, Mr. Balfe, with a gold medal, value 4000 francs, in acknowledgment of his consideration of the composer's talents, but particularly for the merits of the *Puits d'Amour* produced last season at the Opera Comique. His Majesty has also presented a gold medal to Mr. Moore, for the sculptures sent by him to the Exhibition in the Louvre for the present year.

SPAIN.—We have accounts from Madrid to the 10th inst. The decree annulling the tobacco contract has been sent to Barcelona for the royal approbation, and there appears to be no doubt that her Majesty will sign it, as the contractors themselves do not appear unwilling to give up a contract which, if enforced literally, would probably turn out a doubtful speculation. The effect of the measure will, however, according to the general opinion, be the retirement of M. Mon and M. Pidal, should some means not be found to soothe the capitalists, who have taken alarm at the new measures of the Finance minister. Letters from Barcelona of the 2nd inst. contain a full account of the reception of the Royal Family in that city. Their Majesties landed at 10 p.m. at Barcelonetta, where they were met by Baron de Meer, the Captain-General, General Pavia, the Governor, who presented to the young Queen the keys of the city, and by the authorities of the principality. They then entered an open carriage, drawn by six horses, and proceeded to the cathedral, where a solemn *Te Deum* was sung. It was midnight before the Royal party reached the palace. At the first announcement of her Majesty's approach, 300 young men of the town proceeded with torches in their hands to the quay, where they embarked in boats, and awaited in two rows the approach of the Queen. The effect of these two long lines of light on the water when night fell was beautiful in the distance. Montjuich was also illuminated, and the appearance of the flames on the waters below is described as grand in the extreme. —An agent of the Neapolitan Government, charged with the mission of demanding the hand of the young Queen for the Prince of Trapani, was expected to arrive in the next packet from Marseilles. It was even reported that the Prince himself would visit Barcelona during the stay of the Court. On the other hand, an agent of the Prince of the Asturias, the son of Don Carlos, had reached that city some days before.

GERMANY.—A letter from Trieste, of the 3d of June, announces that the Duke of Angouleme died at Goritz on that day. The Royal Duke has been for a long time in a state which left no hope of his recovery. One of the Paris papers says that the French Court will go into mourning on the occasion.—A letter from Cologne of the 5th says that the Queen Dowager of England had arrived in that city, and was to proceed the following morning to Mayence in the Victoria steamer.—On the 25th May the little town of Medeback, in Westphalia, was half destroyed by a terrible conflagration. All the public buildings and above 200 houses are reduced to ashes.—The King of Hanover has created a new distinction, in honour of 50 years' military service, and given it the name of the Cross of Ernest Augustus. The first officer who receives this cross is H.R.H. the Duke of Cambridge.—A letter from Frankfort says—"Baron Anselm de Rothschild having withdrawn the donation of 100,000 florins (260,000 f.) promised by him two years ago for the erection of a new synagogue in this town, because the Consistory of Frankfort thought fit to introduce into the religious ceremonies certain forms which the Baron could not approve of, several organs of the German press have interpreted this act, which was dictated only by a pure scruple of conscience, as an act of intolerant fanaticism. This reproach, however, is shown to be unfounded, by the fact that at the very moment of withdrawing his promised donation, he invested double the sum, or 200,000 florins, in the public funds, which, by a legal and public instrument, he secured in perpetuity, so that the interest might be distributed annually among the indigent families of Frankfort, whatever form of worship they might follow."

ITALY.—A letter from Leghorn of the 4th inst. states, that the political state of Italy is becoming daily more disturbed, and especially that of the Roman States. Several persons of rank, who were compromised in the late events in that country, have been obliged to emigrate. Prince Piombino, Prince Doria Pamphili, and several others, have been obliged to leave Rome, and have arrived at Leghorn.—The papers state that the Papal Government has addressed a note to the Cabinets of London, Vienna, and Paris, on the subject of the late disturbances in its territories. The note declares that there has been no real cause for political discontent, and that the dissatisfaction is chiefly to be ascribed to the machinations of anarchists in France and England. The *Journal of the Two Sicilies* announces that several steamers left Naples on the 21st ult., with troops destined to relieve the garrisons of Sicily. The railroad between Torre dell' Annunciata to Nocera, by Pompeii, Scafati, Angri, and Pagani, has just been opened to the public. The King was present at the inauguration.

RUSSIA.—Letters from St. Petersburgh (23d ult.) state that the departure of the Emperor had taken every body by surprise, and excepting to those few who were aware of his Majesty's intention, the disappearance of the Imperial flag from the winter palace was thought to denote that the Emperor had left for a few days for Moscow. The papers state that the Emperor has conceived the project of connecting St. Petersburgh, by means of a gigantic railway, with Odessa and the shores of the Black Sea. The line, which would extend to the length of 1000 miles, has to pass over Ostrow, Witepsk, Nogatshef, Kiew, and Balta—an undertaking unparalleled in history. It has often been argued that the extent of the Russian empire is too great, that its capital lies too far north, and that even the northern and southern parts of the empire are of too heterogenous a nature, preventing any real political or social amalgamation. These assertions are supposed to have suggested to the Emperor the idea to connect the opposite poles of his great empire by this line of road. It is stated that the immense sums required for such an undertaking are to be raised by a foreign loan, the guaranteed interest of which however is to be less than five per cent.—A letter from St. Petersburgh, of May 26, states that the Government has granted to M. Pasnilau, a merchant of Tobolsk, an authorisation to establish steamboats in Siberia, on the Lake of Baikal, and the rivers Ab, Tobol, Irtish, Jenissel, and Lena, on condition that two boats shall commence plying before the end of the year. They will be the first steamers introduced into Siberia.

CAPE OF GOOD HOPE.—We have accounts from the Cape to April 16. News had been received from Natal, which was not considered very satisfactory. The report was revived there that many of the Boers were about to remove farther into the interior; and although the result of their emigration to Delagoa Bay had disappointed their hopes, still there was a desire for independence of the British government, which may lead to the withdrawal of many of the Dutch farmers. Sir Peregrine Maitland, the new governor, was expected to effect various reforms; and despatches from Lord Stanley were said to have been received, deciding the precedence of the Lieutenant-Governor over the judges, and authorising him to act independently of the governor on special occasions where promptitude is necessary. The Guano island at Angra Pequina had proved very productive; and at one time no less than thirty-eight ships were loading there. We regret to find that it was rumoured at the Cape that the eminent French and Swedish naturalists, Messrs. Delgorgie and Wilberg, had been murdered by the natives in Matzilikatze country. Her Majesty's ship, Cleopatra, had arrived at Simon's Bay, having struck on a coral reef on the coast of Medges, 21st March, and whilst weighing the kedge, which had been used to warp her off, on the 23d, Lieut. Molesworth and seven men were killed by the natives. This outrage was occasioned by two of the natives having been forcibly turned from the boat whilst endeavouring to steal some stores.

UNITED STATES.—The Royal mail steamer Britannia arrived yesterday at Liverpool with accounts from Boston to the 3rd inst. The Baltimore Convention had resulted in the nomination of Mr. James K. Polk, of Tenessee, as Democratic candidate for President, and Mr. George M. Dallas, of Pennsylvania, as Vice-President. This result was quite unexpected, and was looked upon as most favourable to the Whig candidates, Mr. Clay and Mr. Freylinghasen. A great fire had occurred in New Orleans, on the 18th ult., by which property to the value of 400,000 dollars was destroyed. Nearly three hundred valuable buildings were burned, and at least 2000 persons left houseless by the calamity. The ship Ohio had previously arrived at Liverpool on Wednesday morning, after a quick voyage of eighteen days from New York. We have received by her papers to the 24th ult. In answer to a request from the Senate, the President had sent to that assembly a further batch of correspondence: 1st, a note from Mr. Calhoun to the President, stating that no communication from the chargé d'affaires of Texas, temporarily declining the offer of annexation, could be found in the office at Washington; although this fact had been mentioned in a letter of the late Mr. Upshur, which was already before the Senate. 2d. A letter from Mr. Webster to Mr. Van Zant, the Texian chargé d'affaires, inclosing the instructions sent to the American Minister in Mexico. 3d. A letter from Mr. Van Zant to Mr. Webster, stating that Great Britain had offered her mediation, according to convention, signed in London, 14th November, 1840, and asking the mediation of Great Britain, France, and United States jointly, which was not agreed to. 4th. Letter from the Minister at Mexico to Mr. Webster, stating the result of his remonstrance on the part of his government, against the atrocities practised by both Mexico and Texas, in the murder of prisoners, &c., on which occasion the Mexican Minister denied emphatically the right of Texas to be considered a free power, but described her as a revolted province, and that, by the law of nations, rebels could expect no quarter, and resolutely declining the interference of other powers. Accompanying this correspondence is a message from the President himself, which is so curious that we give it entire:—"In answer to the resolution of the Senate of the 13th inst., requesting to be informed 'whether a messenger has been sent to Mexico with a view to obtain her consent to the treaty with Texas, and, if so, to communicate to the Senate a copy of the despatches of which he is bearer, and a copy of instructions given to said messenger; and also to inform the Senate within what time said messenger is expected to return,' I have to say that no messenger has been sent to Mexico in order to obtain her assent to the treaty with Texas, it not being regarded by the Executive as in any degree requisite to obtain such consent, in order (should the Senate ratify the treaty), to perfect the title of the United States to the territory thus acquired—the title to the same being full and perfect without the assent of a third Power. The Executive has negotiated with Texas as an independent Power of the world, long since recognised as such by the United States and other Powers, and as subordinate in all her rights of full sovereignty to no other Power. A messenger has been despatched to our Minister at Mexico, as bearer of the despatch already communicated to the Senate, and which is to be found in the letter addressed to Mr. Green, and forms part of the documents ordered confidentially to be printed for the use of the Senate. That despatch was dictated by a desire to preserve the peace of the two countries, by denying to Mexico all pretext for assuming a belligerent attitude to the United States, as she had threatened to do in the event of the annexation of Texas to the United States, by the despatch of her Government, communicated by me to Congress, at the opening of its present session. The messenger is expected to return before the 15th of June next; but he may be detained to a later day. The recently appointed Envoy from the United States to Mexico will be sent so soon as the final action is had on the question of annexation, at which time, and not before, can his instructions be understandingly prepared.—JOHN TYLER. Washington, May 15, 1844."—Bishop Hughes, of New York, had addressed a long letter to the papers relative to the Philadelphia riots, pointing out the political causes in which they originated, and showing that the violent sectarian animosity of which they were the result, had been encouraged by certain parties for political purposes. The writer is the Catholic Bishop of New York.—It appears from the news from the Havannah to the 7th of May, that the port of San Juan de Nicaragua was blockaded by Her Britannic Majesty's fleet.

Parliament.

HOUSE OF LORDS.

Monday.—The Night Poaching Bill was, on the motion of the Earl of STRADBROKE, read a third time and passed.—On the motion of Lord REDESDALE, the Copyhold and Customary Tenures Act Amendment Bill was read a second time.—On the motion of Lord MONTEAGLE, the Holyhead and Chester Railway Bill was committed.—The Earl of DALHOUSIE announced that when the line was finally settled, the Treasury would be prepared to recommend to Parliament a grant for the purpose of making Holyhead a good packet harbour.—Lord CAMPBELL'S Law of Libel Bill passed through committee.

Tuesday.—In reply to the Marquis of NORMANBY, the Duke of BUCCLEUCH stated that the report of the commission appointed to inquire into the sanatory condition of the poor was in a state of great forwardness, but under revision. Under such circumstances, he did not think any legislative measure on the subject could be introduced in the present session.—The Earl of POWIS, after presenting a great number of petitions against the union of the sees of Bangor and St. Asaph, moved the second reading of the Bill which he had introduced, to repeal so much of the Act of 1836 as provided for the union of those sees. The noble earl having urged the unanimity of the vast number of petitions presented to the House, and the universal feeling of the clergy of North Wales in favour of his proposition, proceeded to answer the objections he anticipated. It might, he said, be called inconsistent to repeal part of an Act so lately passed; but then it would be worse than inconsistent not to repeal it if it were found to work a great evil. But he had a precedent for his motion. Within a short time after the original Act was passed, it was thought desirable to repeal so much of it as related to the union of the see of Sodor and Man with the see of Carlisle. Why, then, should that which had been granted to the intreaties of the inhabitants of the Isle of Man, be refused to the intreaties of the clergy and inhabitants of North Wales? The great increase of the population of Wales, the extent of the surface over which the Bishop would have to exercise his spiritual functions, and the natural difficulties of the country, were all potent arguments against the proposed union of the sees.—The Duke of WELLINGTON opposed the Bill, on the same grounds as alleged last year, when a similar measure was before the House, namely, that it would interfere with the recommendations made in 1835, by the ecclesiastical commissioners, and would disturb the existing political arrangements respecting the number of bishops. His grace moved that the Bill be read a second time that day six months.—The Bishop of BANGOR warmly supported the Bill, and intreated their lordships not to consider the question merely as one of arithmetic, but as one of principle, and as one of deep and strong feeling in the heart of the principality.—The Archbishop of Canterbury admitted that the feelings of the clergy and laity of Wales were in favour of this measure; but argued that the opinions of the commissioners were against it, and against the expediency of maintaining the sees separate. He therefore opposed the Bill.—The Bishop of St. DAVID'S charged the Government with want of regard to the grievances of the Welch people. He knew that representations made to the Government previous to the recent disturbances in Wales had been disregarded, and the principality now felt the bitter effects of that disregard. The Church in Wales was labouring under the effects of that general disregard. In his own diocese there was a great want of the means of educating young men for the ministry, and although a college had been founded out of the savings of the parochial clergy, it was inefficient, for the want of funds—the Government declining to contribute more than one-tenth of what they gave annually to Maynooth, and having hitherto taken no step of any kind to increase it. The right rev. prelate scouted the principle of making an episcopal see in Manchester contingent on the union of the sees of Bangor and St. Asaph; and, having reviewed the opposition given to this Bill, concluded by saying that if the noble Duke, the hero of so many well-fought fields, succeeded here, this would not be one of his glorious victories, but another example of the melancholy truth, that it was much easier for even the best and greatest men to commit an error than to acknowledge it.—The Earl of WINCHELSEA warmly supported the Bill.—The Bishop of LONDON opposed the Bill, on the ground that, if carried, it would endanger the creation of the new see of Manchester.—The Bishop of EXETER supported the Bill, and argued, that it was in committee on the Bill that the inconveniences mentioned by the Duke of Wellington, and the future provision for the Bishop of Manchester, would have to be considered. He said that if the feeling became general that the bishops ought not to sit in the House of Lords, he, for one, would not wish to retain his seat in it.—The Bishop of SALISBURY adduced his own personal experience as an instance of the mischief and disappointment attending the union of sees. He had, he said, the misfortune of having cast upon him the duty of two dioceses; most unwillingly he had been induced by the request of those to whose judgment and experience he felt great deference was due, and by a supposed state of necessity in the Church, for which he had been told no other remedy could be found, to undertake the care of another diocese, in addition to that which properly belonged to him. Now, he could assert, that the union he was concerned with had given satisfaction to no man, and least of all to himself. The burden of it distracted his attention from the duties of his own peculiar diocese; it overweighed his spirits, and it broke his health. He had earnestly desired to be relieved from that burden, but for that relief he had petitioned in vain. The clergymen of his own diocese might well complain that a portion of that care and superintendence which was due to them had been diverted from them; and those of the other diocese deeply felt, he knew, that they were deprived of the care and oversight of a Bishop resident amongst themselves. He assured the Government that by rejecting this measure they would greatly shock the feelings, disappoint the hopes, and shake the confidence of those who were the firmest friends of the Church. Greatly would the Church rejoice to see a Government strong not only in financial resources, not only in its success in both Houses of Parliament, but strong also in those higher attributes which attached to a Government the affections of the people. Greatly would the Church rejoice to see an Administration strong in that faith which can trust for a blessing upon all righteous questions; strong in that hope which can animate to meet difficulties; and strong in that enlarged charity for the souls of men, which would make them see it to be a statesman's duty to bring religion home to the doors of the people, and that the efficiency of the Church of Christ was the only sure foundation alike of social order and eternal peace.—The Earl of HARROWBY likewise supported the Bill.—Their Lordships then divided—For the second reading, 49; for the Duke of Wellington's amendment, 37; majority against the Government, 12. The Bill was read a second time.—The Glass and Vinegar Duties Bill was read a second time.

Thursday.—In reply to the Earl of CLARENDON—The Earl of ABERDEEN stated that the Emperor of Morocco and the Government of Spain had accepted the mediation of this country in the quarrel that had arisen between them; and he confidently anticipated that a just and reasonable settlement of their differences would speedily be effected. With respect to the actual hostilities which had commenced between Morocco and France, Lord Aberdeen stated that he regarded it as an affair altogether trifling and accidental, and one that would not lead to any serious breach of friendship betwixt France and Morocco. He entirely exonerated France from any hand in fomenting the quarrel between Spain and Morocco, and from any desire of provoking hostilities with the Moors.—Lord MONTEAGLE submitted his motion for a select committee to inquire into the effects of the import duties, as at present existing, on the commerce, the revenue, and the general prosperity of the country. The noble lord, in a three hours' speech, contended that the principles of free trade, as tested by the experiments already made by Government in that direction, had turned out in practice to be beneficial to the revenue, trade, and general prosperity; and that these principles should be carried out to the full in all things. Though all foreign countries might still cling to protection, Lord Monteagle held that as a stronger reason that this country should hold to anti-protection as its "distinctive die." A general war of commercial competition, he said, had succeeded a general struggle of naval and military strength; and in order to show our greatness in the arts of commerce as of arms, he urged that we should stand single-handed against the world under the banner of anti-protection and free-trade.—The Earl of DALHOUSIE complimented Lord Monteagle on the excellence of his speech and principles, and opposed his motion on the ground of time only. Two years, he said, had not elapsed since the whole of our commercial system had undergone a thorough revision; therefore it was now too soon to re-open the question. The surplus of revenue over expenditure had arisen from the Income-tax; therefore, until it was seen that we had a surplus without the Income-tax, it was premature to reduce our duties further. He enumerated the various instances in which Government had carried out the principles of Free Trade—especially the removal of all duty from wool—and claimed the confidence of their Lordships for the Government in permitting them to test their own experiments, and to remove, as they deemed opportune, further restrictions from commerce.—The Earl of CLARENDON complimented Lord Dalhousie with "appearing to speak against his conviction;" and yet with coinciding completely with the doctrines propounded by Lord Monteagle. The noble Earl supported the motion.—Lord COLCHESTER warmly opposed the motion. He maintained that the vast difference between countries without colonies and this country, with its great colonial system, was a sufficient reason why the restrictive policy might be disadvantageous to them and yet indispensable to us.—The Duke of RICHMOND would have had no objection to the motion could he have agreed to it without implying that he was a free-trader, or without admitting that Lord Monteagle's arguments were valid, which he certainly could not admit. The reason why he wished for inquiry was, that he might show the peculiar burdens borne by the agricultural interests which entitled them to protection. This was one of the motions frequently made in Parliament, because it was known beforehand that they would not be carried; and Lord Monteagle knew well that his committee would not be agreed to, else he would never have proposed it. The noble Duke denounced this as a paltry party motion to attack the Government for their conduct on the sugar and timber duties, and declared his intention of opposing it, not because he was satisfied with the conduct of Government, but because he was most dissatisfied with the conduct and principles of Lord Monteagle. He confessed that he did not like the spirit of the noble Earl, the Vice President of the Board of Trade; and he hoped to have heard from the Government such a declaration as this—"We are of opinion that so long as the agricultural interest is subject to its present burdens it is entitled to protection." The Duke concluded his speech by saying that he seemed to be in the position of hardly agreeing with any one, except his Noble Friend (Lord Colchester)—but he was convinced that if they polled the people of England, they would find a large majority, both in England and Scotland, who entertained the sincere belief that free trade would be the ruin of this country, and who would use every constitutional effort to prevent the adoption of a system which would destroy them, destroy the labourer, and make their country dependent on foreigners for its supply of food.—The Earl of WICKLOW agreed in all the theories and doctrines laid down by Lord Monteagle, but objected to vote for his motion, because the Government, having declared their entire coincidence with those principles, wished only for time to carry them into effect, which he was willing to accord them. He was satisfied that the true policy of England was to pursue a free and unfettered commercial intercourse with other nations, but he had no hope that for a long period other countries would follow that example.—The Marquess of LANSDOWNE ridiculed the argument used by Lord Dalhousie, that because our free trade experiments had succeeded, therefore we should pause ere we experimentalised further. Looking at the signs of the times and regarding the tone of the Vice-President of the Board of Trade's speech, Lord Lansdowne confidently predicted that another session would not pass without producing further and greater advances in the free trade direction by the present Government, who, by the mouth of their Prime Minister, had lately declared that the sugar duties were only in a state of transition.—The Earl of WINCHELSEA gave his decided opposition to the motion, on the simple ground that he believed free trade would be the ruin of the country. If foreign countries would remove their restrictions, or if we were unburdened with an enormous national debt, we might entertain the notion of free trade; but circumstanced as we were, free trade would, if carried forward, ultimately cause the downfall of Great Britain. Their Lordships divided—Contents: present, 38; proxies 37;—75. Non-contents: present, 90; proxies, 94;—184—majority, 109. The motion was then rejected.

Friday.—The Duke of RICHMOND and others presented a great number of petitions in favour of protection to agriculture.—The LORD CHANCELLOR, in answer to certain remarks of the Earl of WICKLOW, said that if he were to attempt to correct the errors which appeared in the newspapers, he might sit in that house and do nothing else to all eternity. At the same time he had to state that there was no foundation for the assertion in the papers to the effect that the judges' circuits were to be postponed in consequence of the writ of error in the case the Queen *v.* O'Connell.—The Earl of MINTO called attention to the distressed state of the great majority of the schoolmasters in Scotland. He wished to know if the Government intended to assist that very meritorious class, and improve the system of Scotch education by introducing a measure to that effect?—The Earl of HARDINGTON said that the attention of the Government had been directed to the subject, and though he could not pledge himself on the part of the Government that a measure would be introduced this session, still he was prepared to state that the matter would receive that attention from ministers it so well merited.—After a few words from Lord BROUGHAM, the Earl of GALLOWAY bore testimony to the impoverished state of the schoolmasters in Scotland; certain parts of the Act of Parliament referring to the Scottish schoolmasters disgraced the statute books. [Left sitting.]

HOUSE OF COMMONS.

Friday.—After the speech of Sir J. GRAHAM on the Parishes (Scotland) Bill, noticed in our last, the House then divided, when there were—For going into committee, 113—Against it 59—Majority, 54. The House then went into committee.—On the 1st clause being proposed, Mr. ELLICE opposed it on the ground that it would interfere with property which had been purchased on the faith of existing Acts of Parliament. The committee divided—For the clause, 52—Against it, 20—Majority, 32.—On clause 8, Mr. F. MAULE divided. He objected to the power given to those who had a life interest in property to alienate it

for the purpose of endowing churches. He moved, as an amendment, that one-and-a-half acres, instead of four, be inserted for the quantity of ground to be given for the erection of endowed churches—For the amendment, 17—For the clause, 53—Majority for the clause, 36. Another unsuccessful division on the 9th clause took place. The remaining clauses were agreed to, and the Bill was ordered to be reprinted with amendments.

Monday.—Sir R. PEEL, in answer to Mr. Borthwick, stated that Government had received, in an informal way, proposals from Don Carlos, suggesting a marriage between his eldest son and the Queen of Spain, with a view to the tranquillisation of that country, and settling the question of the right to the throne. If this proposal were seriously entertained, Don Carlos would then state what sacrifices or concessions he was willing to make, in consideration of it. The British Government did not think that the proposal would tend, in the present state of parties in Spain, to remove all causes of disturbance, and tranquillise the country; but they thought it to be their duty simply to transmit the proposals to the Spanish Government, considering it, as the constituted authority and representative of the Spanish people, the fitting judge of the matter.—The first public business was the consideration of the Sugar Duties Bill, and on the question that the Speaker leave the chair—Mr. JAMES, as one of those unfortunate beings called a West India planter, craved leave to state his view of the actual condition of the West India interest. He took his own case as a favourable illustration. His son, a business man, resided on the property, and he had no extra charges, beyond the ordinary brokerage, &c. Every pound of sugar cost him 4*d.* a pound in production and transmission; the duty was 3*d*, making the sugar 7*d.*, and, taking the average of the last three years, he had only been able to get 6½ a pound, entailing a loss of 500*l.* on every 100 hogsheads of sugar, produced from a property which, before emancipation, yielded a clear annual revenue of 3000*l.*, and during the period of apprenticeship one half of that amount. This was a loss for which his share of the twenty millions was no compensation. He appealed to the House for a favourable consideration of the cruel case of the West India planters, who were an interest extremely weak, as compared with the landed proprietors, or even the manufacturers, and called on the former to make common cause with them, for they did not know but ere long they would be in the same boat with them. If the House would not legislate for their benefit, let it, at least, not injure them; facilities should be given to enable them to produce and transmit their sugar cheaper, and the colonial sugar duty should be considerably lowered.—Mr. EWART thought that the proposition of the Government was an evidence of the sagacity of Sir R. Peel, who, disregarding taunts of inconsistency, felt the necessity of yielding to the growing pressure of the community on the means of subsistence. He urged the wisdom, as well as expediency, of at once going still further, and, by equalising the duties on all sugars, to enlarge the amount of supply. The richer classes of this country consumed from 60 lbs. to 70 lbs. of sugar per head annually; but the humbler classes were only able to consume about 7 lbs. per head, and that of a quality adulterated by various expedients. Our foreign was of more importance than the colonial trade; and seeing the inevitable tendency of our commercial legislation, it would be wise in the West India interest to yield in time, and prepare for that which must come at no distant period. Justice would not be done to our commerce without a general system of reduction of import duties; and as a first step towards this, he would propose the equalisation of the duties on all sugars, foreign or colonial, and moved an amendment to that effect.—The CHANCELLOR OF THE EXCHEQUER had heard nothing calculated to change his opinion, more especially as Mr. Ewart, on a former occasion, had urged the very same arguments in favour of an alteration similar to that which the Government are now making, namely, the introduction of free-grown to the exclusion of slave-grown sugar.—Mr. HUME, though opposed to all differential duties, was not prepared absolutely at once to vote for the equalisation of the duties. He would give the West Indians, whose hands had been tied by the legislation of this country, some time, say three years, to prepare for the change.—Mr. LABOUCHERE was also not prepared to vote for an instant equalisation.—Mr. M. GIBSON asked what claim the West India interest had on the manufacturing community? Encouragement to the colonies was discouragement to the community of this country. He wanted the reason of this differential duty; on what grounds the amount was fixed at 10*s.*; what was the principle or justifiable claim which led them to create this new discriminating duty? The Government proposition would not materially reduce the price of sugar; and it was strange to see a government, with its practised reputation, adopting, as part of its policy, the amiable weaknesses of those who refused to eat sugar during the anti-slavery agitation, which ended in emancipation. This discrimination between free grown and slave grown foreign sugars might be followed by high discriminating duties against British manufactures on the part of other countries, especially the Brazils.—Mr. VILLIERS regretted that no Member of the Government rose to answer the question of Mr. Gibson. The amount taken out of the pockets of the people of the Metropolis and of the country generally by this system of protection, from the statement of the West India interest, did not benefit them, while it robbed the Exchequer and the community. They were maintaining a system which cost five millions a year, and yet was useless to those for whom it was maintained; and the Government was bound to give some explanation of the reasons on which it rested.—Mr. GLADSTONE thought that the reasons for the policy pursued by Government had been sufficiently explained, and were perfectly familiar to the House. There were two reasons: the first, that of caution in a state of transition from one system to another; and the second, that the West Indies, being insufficiently supplied with labour, required protection to enable them to compete with other countries.—Mr. COBDEN said we maintained the colonies, protected them with our army and navy, and, in the face of these facts, the arguments used in that House for protection were as audacious as those of the Duke of Richmond about the loss of 2000*l.* a year on his fish. He amused the House by reading the resolutions of the House of Commons in 1640 against "projectors and monopolists," expelling them from the House, at the time when the tobacco-patent granted by Charles I. was in question; and applying it to the existing state of things, urged that the West Indies would find themselves much better off in the hands of the free traders than beat too and fro with new modifications of monopoly.—Mr. P. M. STEWART would undertake, before a special committee, to show what were the special burdens and disadvantages of the West Indies which required protection, and which had been brought about by the legislation of this country.—Mr. BRIGHT urged the free trade view in favour of the equalisation of the duties, and expressed an opinion that it would be for the better, both for the consumer and the West Indies, that the planters should receive an annual grant, equivalent to the difference in price on the amount, than that the price of sugar should be unnaturally raised by a differential duty.—Mr. BERNAL spoke at length in defence of the West India interest, which had no desire to return to the old abominable system of slavery, but only required time and fair play to render the experiment of emancipation completely successful. They were taunted with compensation having been awarded to them; but though almost regretting that they should have accepted money, he denied that the sum awarded was compensation in any proper sense. Want of energy was also attributed to them, which it was alleged competition would alone remedy. But there was no part of the world where agricultural improvements were more actively going on, in the shape of the introduction of new machines and experiments with new manures. The old faith in colonies, as entertained with the welfare of this country, was declining; and the cry was free trade—import cotton and export calicoes, even if they should be left to bleach on the sands of Central America. But free trade was a great experiment—he hoped it would prove successful when put in practice.—Mr. ROEBUCK pictured the privations of the mass of the people of this country, between whose desires and amelioration there interposed this bankrupt but diminutive class, who, with the mortgages on their estates, were not entitled to the name of proprietors. If they were to be represented in the House according to their importance in the community, a fraction of a member would do them justice. He hoped that the great principle of free trade—"buying in the cheapest, and selling in the dearest market," would prevail, not merely in the case of corn, but, as he considered it, in the far greater interest of sugar, the extension of the demand for which would add to the comforts and increase the employment of the people. The West Indies were a load to this country; and we would not suffer the slightest injury if they were suddenly to disappear from the face of the globe.—Lord SANDON remarked that the West India colonies took three millions annually of our manufactures—a fact of itself which showed that they were not so insignificant to this country as "philosophers" would have it. The dole of twenty millions was "magnificent" for Britain; but it was in no respect "compensation" to the planters; and the entire colonial system, linked as it was with slavery, had been forced by this country as a part of its policy for enhancing its own greatness. The equalisation of the duties would aggravate the slave trade beyond all check or control.—Mr. WARBURTON advocated free trade, and Mr. MACLEAN opposed it. On a division there appeared—For the equalisation of the differential duties, 55—Against it, 259—Majority against, 203.—The House then went into committee, *pro formâ*, and the Chairman reported progress on a motion of Mr. MILES, the discussion of whose amendment was postponed till Friday. — The Vestries in Churches Bill, to enable parish vestries to be held in other places than churches, under the control of the bishop, was the next business on which the House went into committee, it having already passed the first and second reading. But it was vigorously opposed, especially by Mr. ROEBUCK, who attributed it to Young England, or "Little Britain," and said that on account of certain allegations of indecorum happening at vestries held in churches, the Bill proposed to take away a right enjoyed by every parish in England from time immemorial.—The CHAIRMAN of the committee, having been appealed to, said that there was a rule of the House requiring that all Bills relating to religion should originate in resolutions passed in a committee of the whole House.—The SPEAKER, happening to be present, was asked, and gave it as his opinion that this Bill was not one which came within the rule.—Mr. WARBURTON then remarked that the provisions of the Bill were unknown to the country, and yet there were 11,000 parishes in England interested in it.—Mr. ESCOTT concurred in the propriety of postponement; and Mr. JERVIS pointed out that the drawer of the Bill was ignorant of the commonest legal knowledge.—Mr. STAFFORD O'BRIEN, whose Bill it is, appealed to the Government, and Sir R. PEEL advised postponement in order to consider objections, which was adopted.

Tuesday.—The Ness Fisheries Bill was read a third time and passed, after a division.—Sir J. GRAHAM said that Government proposed to fix the second reading of the Irish Registration Bill for Monday the 1st of July. Upon that day the Government would, if the progress of other Bills permitted, take the sense of the House on the second reading of that Bill. It was also their intention to take the Committee on the Dissenters' Chapels Bill on Monday next, and on Thursday se'nnight the committee on the Poor Laws. Shortly after the second reading of the Irish Registration Bill they would also proceed with the Irish Municipal Bill.—Mr. BORTHWICK gave notice that, as the Government had at last fixed a day for the Poor Law Bill, he should, instead of the Bill he proposed, move a resolution as an amendment to the motion for going into committee on the Government measure.—Mr. BORTHWICK moved for a select committee to consider the operation of the Anatomy Act. He brought forward the invention of a Mr. Roberts for preserving bodies, and stated his object to be to protect the most helpless classes of society, to promote science, and to guard the health of the students of anatomy themselves from the present noxious operations of the dissecting-room.—The motion was seconded by Mr. Hardy.—Sir J. GRAHAM objected to the motion as one that would be injurious to the public interests, and calculated to irritate and wound the public feelings. After a discussion in which Mr. FRENCH, Mr. WARBURTON, Alderman COPELAND, Mr. T. DUNCOMBE, Lord J. RUSSELL, and General JOHNSON took a part, the House divided. For the motion, 10—Against it 49—Majority, 39.—Mr. WARD then brought on a motion for a committee of the whole House, upon the present state of the temporalities of the Irish Church. He admitted the seriousness and difficulty of the subject; but the necessity for its agitation arose from there being no change in the policy of the Government, no prospect of an effort being made to conciliate the alienated feelings of the Irish people. A twelvemonth had elapsed without any legislation for Ireland; and though Sir R. Peel had the merit of having changed his views, his recent declarations and those of the Duke of Wellington, as to their determination to maintain the Protestant Church, were calculated to irritate, but could not conciliate. These declarations were merely mischievous; like the Duke of York's famous protest against Catholic Emancipation, they only delayed what could not be prevented, protracting just concessions until they lost half their value. Addressing himself to the comparative statistics of the Established Church in England and in Ireland, he showed that while the English episcopal hierarchy might assume that it had to deal with a population of fourteen millions, with the supervision of between ten and eleven thousand parishes, the Irish Church had but 2450 parishes, and only 750,000 Episcopalians, for whose spiritual instruction it received the net annual revenue of 652,000*l.*, not to mention the many grants for education, glebe houses, tithe arrears, and so forth. He then glanced at the past history of English policy in Ireland; traced the bulk of Irish grievances to the existence of so anomalous an institution as the Established Church, condemned by all reflecting men, amused the House by reading printed placards, announcing the sale of the effects of the late Archdeacon of Meath, in which racing horses, hounds, beagles, and all the *et ceteras* of a fox-hunting squire, were the conspicuous features. Ireland was our Poland; as such, she gathered round her the sympathies of the Continent; while England, with her broad notions of liberty as respected herself, and her generous exertions in favour of the Negro population of her colonies, staked security and happiness on the maintenance of the remnant of an exclusive system which ought to have expired with Catholic Emancipation. He called on them to put an end to it at once, and by adopting the only course which can avert the Repeal of the Union, legislate for the Empire, and accomplish the work commenced in the emancipation of the Roman Catholics.—Lord ELIOT said that the security of the Church was provided for by the Act of Union, citing the sentiments of Grattan, Plunket, Canning, and other advocates of the Catholic claims, in order to show that their concession would not affect its integrity. Catholic Emancipation did not destroy the essentially Protestant character of the Constitution; and looking to the way in which the Protestant clergy generally spent their incomes, especially in remote and poor districts, no greater evil could happen to Ireland than to take away the revenues of the Establishment, and apply them to secular purposes. He hoped therefore that the House would reject the motion by a large majority.—Mr. Ross supported the motion.—Mr. SHAW admitted that the neglect and mal-administration of the Irish Church in past times was one cause why there had not been more converts from the Roman Catholic religion to a purer faith. But the case of Archdeacon de Lacy was no specimen of the existing condition of things. He was an old gentleman of very peculiar habits, with a large private fortune, and, notwithstanding his sporting eccentricities, spending large sums in acts of benevolence. Mr. Ward was misinformed when he stated the net income of the Irish Church at 650,000*l.*; that was the gross amount; and the net income, allowing for all deductions, was only 550,000*l.* As there were, in round numbers, 1400 benefices, this would give 225*l.* to each beneficed clergyman; but as, including curates, the number of clerical persons in Ireland was about 2200, the average amount to be divided amongst them was reduced to 170*l.* The Irish Establishment would stand a comparison with any other Church; pluralities were in course of abrogation; non-residence was rapidly diminishing; and church extension, chiefly by the aid of private exertions and funds, was vigorously carried on, in the erection and endowment both of churches and schools. The Irish clergy had suffered much, and were ready to suffer more; and it was an ungrateful return, after all their sacrifices, to seek to abolish Protestantism altogether. He was glad, therefore, that the Government had met the motion with a manly resistance.—Mr. RENTINGTON commented on Mr. Shaw's statistics, and said, it appeared, from his statement, that one-fourteenth of the clergy of the Irish Establishment were absentees. For this a very sufficient explanation might be given. In his own parish there was not a single Protestant; and in the union to which it belonged not above 30 individuals attended the church. Such a state of things could not be prolonged for ever.—The debate was then adjourned.

Wednesday.—In reply to Mr. M. GIBSON, Sir J. GRAHAM stated that the spread of incendiarism in Norfolk, Suffolk, and part of Essex had engaged the attention of the Government, and that they had instituted inquiries to ascertain the origin and the perpetrators of those fires, but without success. Their inquiries, however, led the Government to believe that the peasantry generally were in no way implicated in these crimes, but that they were perpetrated by a few malignant persons—perhaps by a single individual—influenced alone by personal motives.—In answer to Mr. BULLER, Sir J. GRAHAM announced that the writ of error in the case of O'Connell and others had arrived in town, that everything had been done by the Government to expedite its progress, and he trusted it would be heard in time to enable the Judges to proceed to their respective circuits within ten days of their usual period of departure.—The adjourned debate on the motion of Mr. Ward on the Irish Church Temporalities was resumed by Colonel RAWDON, followed by Mr. M. O'CONNELL, Mr. D. BROWNE, and Sir C. NAPIER, in support of the motion. Sir C. Napier said that the first shot of war, if the Prince de Joinville should ever carry into effect his threatened steam-invasion, would do more justice to Ireland than all their speeches in that House.—Sir J. GRAHAM said that Sir C. Napier's threat of mischief from hostile steamers, was an injustice to the loyalty of the Irish Roman Catholics; a sure way of nullifying any danger in the Channel would be to place the gallant Commodore himself in command there. The thin attendance of the House showed that the motion and its discussion were deficient in novelty and interest.—Mr. V. SMITH, Lord J. RUSSELL, and Mr. SHEIL supported the motion.—Sir. J. WALSH, Mr. FORBES, Mr. HAMILTON, Sir R. PEEL, and Sir R. INGLIS, opposed it—Sir R. Peel on the ground that it would shake public confidence by disturbing contracts, and Sir R. Inglis defending the maintenance of the Irish Church, not on the grounds of agreements, or expediency, but on that of its truth and divine ordination. The House divided—For the motion, 179; against it, 274; majority, 95.

Thursday.—A petition complaining of the return of the Hon. Mr. Bouverie for Kilmarnock was presented.—Capt. POLHILL gave notice for the 2d July, to ask for leave to bring in a Bill to exempt from the payment of stamp duty all policies of insurance on farms and farming-stock against damage by hail.—In reply to Mr. C. BERKELEY, Sir J. GRAHAM repeated his assertion that the Lord Chancellor had a Charitable Trusts Bill in preparation, and that it would be produced shortly. Being pressed by Sir G. GREY to state whether or not the Government intended to pass the Bill during this session, Sir J. GRAHAM replied that the power of introducing Bills was in the hands of the Government; the power of passing them rested with the House. It was impossible for him to say within what period the Bill would become law. To several other questioners, Sir J. GRAHAM repeated the same indefinite answer.—Mr. C. BERKELEY and Sir G. GREY announced their intention, should the Bill be delayed to July or August, to give it every opposition in their power. To a question by Mr. BARING, the CHANCELLOR of the EXCHEQUER replied, that the Government had no intention, at present, of altering the scale of duties on sugars already laid before the House. On the order of the day for the second reading of the Bank Charter Bill, Mr. HAWES moved as an amendment:—"That no sufficient evidence has been laid before the House to justify the proposed interference with banks of issue in the management of their circulation." The amendment was seconded by Mr. HASTIE.—The CHANCELLOR of the EXCHEQUER, Sir W. CLAY, Mr. HUME, Mr. MASTERMAN, Mr. WARBURTON, Mr. DARBY, and Sir R. PEEL, spoke in favour of the Bill.—It was opposed by Mr. NEWDEGATE, Mr. WODEHOUSE, Mr. C. BULLER, Mr. GISBORNE, Colonel SIBTHORP, and Mr. MUNTZ.—The House having divided, there were — For Mr. Hawes's amendment, 30—Against it, 185—Majority, 155.—The Bill was read a second time.—Sir R. PEEL obtained leave to bring in a Bill to define and regulate certain rights of the Duchy of Cornwall; and another to enable his Royal Highness to sell and exchange certain lands in the Duchy of Cornwall, on behalf of the Duke of Cornwall.

Friday.—Mr. T. S. DUNCOMBE, pursuant to notice, presented a petition from W. J. Lenton, Joseph Mazzini, and others, resident in London, complaining of the detention and opening of their letters at the General Post Office, and praying for immediate inquiry and redress. The hon. Member wished to ask, whether the letters had been opened at the Post Office by orders of the Government?—Sir J. GRAHAM said, the complaint of the petitioners was without foundation. The Secretary of State had, under a Royal warrant, authority to direct that suspected letters should be opened by the authorities of the Post Office.—Mr. T. S. DUNCOMBE said, it was evident the right hon. bart. wished to blink the question (loud cries of "Order, order"). The hon. Member said he would not be put down.—Mr. SHAW said it was clear the hon. Member for Finsbury was out of order.—The SPEAKER said, it was not regular for the hon. Member to make any observations on the presentation of a petition, although he had given notice of presenting it, unless the grievance complained of was pressing. He thought the hon. Member was out of order.—Mr. T. S. DUNCOMBE.—I will not be put down, and I therefore move that the House do now adjourn (loud cries of "Hear, hear").—The question having been put—Mr. T. S. DUNCOMBE said, "Now I am in order, and have a right to remark on the petition which has been sent to me for presentation." After some strong observations the hon. Member said, he wished for a committee to inquire into the subject, as he had no hesitation in saying that letters had been opened in a most unwarrantable manner by the Post office authorities, by order of the Secretary of State. If a committee was allowed him, he would prove the allegations in the petition.—Mr. WALLACE said he believed the statements in the petition were correct, and he wished to see the power of opening letters taken away from the Secretary of State. If it was continued, it was continuing the spy-system.—Mr. LABOUCHERE said he could not consent to have the power now exercised by the Secretary of State of opening letters taken away. However unpopular, he could not consent to deprive the Executive Government of the authority which they possessed.—Dr. BOWRING considered such a power was totally unworthy of a constitutional administration. It was only fit for a despotic government.—Mr. WARBURTON thought that such a power was necessary; but he thought there ought to be a separate warrant

issued from the Home Office for the opening of every letter. Were such warrants issued in the cases of the petitioners?—Sir J. GRAHAM said he had acted in strict conformity with the powers entrusted to him by the constitution, and he could not give any further explanation.—Mr. ROEBUCK thought that some restrictions ought to be placed on the power now exercised by the Secretary of State on the subject of opening suspected letters.—Mr. HUME was of opinion that the power ought to be taken away altogether. It was disgraceful to the country that the Secretary of State should exercise such authority. He wished the right hon. baronet to give some explanation of his conduct on the occasion referred to by the petitioners. If he did not, he might depend upon it this was not the last occasion he would hear of it.—Mr. FRENCH was of opinion that the Post Office authorities had acted illegally in opening letters without any express warrant from one of the principal Secretaries of State. It appeared that had been done; and, if so, it was illegal.—Mr. WATSON said the Post Office authorities could not legally open a single letter without an express warrant under the hand and seal of her Majesty's Principal Secretaries of State. In the case referred to by the petitioners he was of opinion the Post Office had exceeded its authority.—After a few words from Mr. CHRISTIE, Mr. T. S. DUNCOMBE said it was a scandalous and nefarious transaction; and as the right hon. Secretary for the Home Department refused to enter into any further explanation, he would divide on the motion that the house do now adjourn.—Strangers were ordered to withdraw, but no division took place. The motion was negatived, on the understanding that Mr. T. S. Duncombe would bring the subject forward again on the first supply night.—The house having gone into committee on the Sugar Duties Bill, Mr. GREENE in the chair, Mr. P. MILES rose, pursuant to notice, and moved his proposed amendment, reducing the duty upon sugar, the produce upon British possessions, to 20*s.* the hundred weight; and the duties on sugar, certified to be the growth of China, Java, or Manilla, or of any foreign country declared to be admissable, as not being the produce of slave labour to 30*s.* and 34*s.* the cwt. After a long debate, at 2 o'clock this morning, the House divided on the Government proposition, which they rejected, leaving Ministers in a minority of 241 to 221.—When they had subsided Sir R. PEEL arose, and with great agitation of manner stated that the first business on Monday should be the resumption of the proceedings on the subject of the sugar duties.—The Chairman reported progress and asked leave to sit again.

CITY.

Money Market, Friday.—Consols for the opening, closed at 97⅛, Red. Three per Cents. 98¾. Three-and-half Red. at 101⅝. Exchequer Bills have improved a small shade, and are 73 75 pm., whilst Bank Stock has declined to 197½.

BANKRUPTCY ANNULLED.—S. WILCOCKSON, Chesterfield, Derbyshire, Linendraper.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. HEWARD, Hendon, Middlesex, hay salesman—D. ROSS, Little Love-lane, warehouseman—F. ROGERS, Cooknoe, otherwise Cogenhoe, Northamptonshire, miller—J. DEALTRY, Burnlem, grocer—G. GROVE, Wick and Abson, Gloucestershire, miller—H. LAKE, Cheltenham, printer.—D. MACFARLANE, Berners-street, Oxford-street, wine-merchant—A. THOMPSON, Southampton, Grocer—H. WOOD, Basinghall-street, woollen-factor—R. MUSGROVE, Birmingham, woollen-draper—T. JOHNSON, the elder, W. JOHNSON, and C. MANN, Romford, Bankers—J. TAYLOR, Liverpool, commission agent.

SCOTCH SEQUESTRATIONS.—J. LOW, Dundee, merchant—R. BOWIE, Meathie, near Forfar, farmer—A. MACKIE, Glasgow, merchant.

Metropolis and its Vicinity.

The Polish Ball.—This ball went off on Monday night with all the *éclat* that its most enthusiastic promoters could have wished for. Both the numbers and distinction of the visitors present exceeded expectation, although it was generally anticipated that the ball would sustain no detriment by a recent event, which had given rise to apprehension on that point. The ladies patronesses were present in strong numbers—many of them dressed in the costumes worn on the occasion of Her Majesty's ball two years since. The full dress uniforms of the army and navy, and the fancy attire of the ladies and gentlemen who personated Greeks, Turks, Chinese, and other Orientals, all combined to give the room a gorgeous appearance, although by far the majority of the company attended in full dress. From the crowded state of the room, however, very little comfort was experienced during the early part of the evening. The number present was estimated at 1000, or 1100; and the amount realised by the ball, it is expected, will be upwards of 700*l.* There has been a statement in circulation, that the Emperor of Russia sent 500*l.* for a ticket. It is true that his Imperial Majesty offered a munificent donation, but, according to the *Morning Chronicle*, the offer was declined, the society preferring to be dependent on public rather than private generosity.

Hospital for Consumption and Diseases of the Chest.—H.R.H. Prince Albert laid the foundation stone of the new Hospital for Consumption and Diseases of the Chest on Tuesday, on a spot at the north side of the Fulham-road. The ceremony took place in a pavilion erected for the purpose, Mr. Frances, the architect, handing the adjusting instruments to the Duke of Norfolk and Lord Arundel, who presented them to the Prince. The Bishop of Worcester read the prayers, and a large body of clergymen attended. The most effective part of the whole ceremony was the chanted response of the charity children. His Royal Highness retired on the conclusion of the ceremony, and having mounted his horse, proceeded at a walking pace to the bazaar at Chelsea Hospital, accompanied by the committee on foot. On his arrival at the grounds the Prince dismounted and walked round the range of tents in which the stands were placed, at each of which he purchased some article from the ladies patronesses in attendance. The Prince left after a short visit, but the great body of the company remained for several hours enjoying the scene, and promenading in the grounds of the College.

Society of Arts.—The fifty-seventh anniversary of the Society of Arts was held on Monday in the great hall of the Society, in the Adelphi, for the purpose of distributing the various rewards adjudged during the present session. Prince Albert, President of the Society, took the chair and presented the prizes to the respective candidates, and the hall was consequently filled to overflowing by a numerous assembly. After the prizes had been distributed, the Duke of Sutherland moved that a vote of thanks be presented to his Royal Highness, "the greatest patron of art," his grace remarked, "in Great Britain, who had manifested such cordial satisfaction at the efforts of the candidates, and took so great an interest in their progress." The Marquess of Northampton seconded the motion, remarking that it was extremely satisfactory to see the beloved consort of her Majesty present, and taking part on such an interesting occasion. His Royal Highness, in returning thanks, expressed his great satisfaction at the flourishing state of the Society, and his hope that it would continue to prosper, as long as the Society was necessary.

Merchant Tailors' School.—The annual examination of the head scholars of this foundation took place on Tuesday in the presence of a large number of visitors. This year it has happened that not a single vacancy has occurred either in the fellowships of St. John's, Oxford, or in any of the exhibitions at the gift of the Company in either of the Universities; but though the reward of a fellowship or of an exhibition did not on the present occasion fall to the lot of Mr. Edwards, the head scholar, and the other successful candidates, the ordinary custom was maintained; and the Rev. Dr. Wynter, Vice-Chancellor of Oxford and President of St. John's, and the two senior fellows, attended at the school, and commenced the proceedings of the day by examining the scholars. After the examination the orations were delivered. In the evening the annual dinner was given in Merchant Tailors' Hall, which was attended by several peers, judges, clergymen, and others; but the Cabinet Ministers and several Members of Parliament, who are in the habit of dining with the Company on these occasions, were prevented from attending by Parliamentary business.

Metropolitan Improvements.—The greater portion of the houses between Charlotte-street, Bloomsbury, and Oxford-street, to be removed for the formation of the new street, have been taken down to the foundation. Between Bedford Chapel and High-street, St. Giles's, which was a short time ago the parish stone-yard, poles are erected to form the line of the new houses, the cellars of which are now forming. In Belton-street, leading from High-street to Long Acre, the new church of Christ Church, the foundation stone of which was laid a few weeks ago, on the east side of the street, is in a state of forwardness; and but few houses remain between that street and Long Acre to be demolished. In Cranbourn-street, Leicester Square, an entirely new pavement has been laid down, giving the public thoroughfare all the appearance of a street; and in a short time the new houses will be erected.

The Will Forgeries.—Since the discovery of the late will forgeries, the Bank of England has adopted new regulations with reference to the granting powers of attorney for the sale or transfer of stock. When an application is made for a power of attorney, a letter is forwarded to the party or parties in whose name the stock stands, of which the following is a copy:—"Application has been made for a power of attorney for the transfer of stock standing in your name; I request you will sign and return the letter attached to this, stating the amount of stock to be transferred, and the name of the party to be your attorney." On the off sheet is the following letter, on the outside of which a postage stamp is also affixed:—"I wish to give a power of attorney for the transfer of —— stock." The Bank will not in any instance grant a power of attorney until answers have been received from the parties to whom the above letters have been forwarded.

Temperance Society.—On Tuesday evening, the anniversary meeting of this body was held at the Music-hall, Store-street; Lord Teignmouth in the chair, supported by the Bishop of Norwich, and other friends of the temperance cause. The meeting was at intervals of a most uproarious character, owing to the interruption of a large body of teetotalers, who congregated in great numbers in the Hall. The chairman opened the proceedings in a brief address. The secretary read letters from Lord Ashley, the Bishop of London, the Dean of Salisbury, the Hon. W. Cowper, Sir E. Parry, and others, expressive of the interest they felt in the Society's operations. The Report gave a detailed statement of the proceedings of the Society. The Bishop of Norwich briefly moved the adoption of the Report. He said he was always happy to support the cause of temperance, and regretted that he had not been able to attend the meeting of the teetotallers lately held at Exeter-hall, the motto of whose Society was, "Touch not—taste not—handle not." (Loud cheers from the teetotallers). The motto of the British and Foreign Temperance Society was, "Let us so use the things of the world as not to abuse them." (Cheers and hisses). He did not agree with the sentiment of the teetotallers; he was for temperate exercise in all things.—The Rev. D. Ruell seconded the motion, and at this stage of the proceedings the teetotallers urged one of their representatives, a man named Miller, to get on the platform. He did so, and endeavoured to address the meeting, but was received with mingled cheers and hisses. Great wrangling ensued, with much noise and clamour, which the chairman endeavoured, but ineffectually, to quell. The Bishop of Norwich advanced, and vehemently addressing Miller, said—"Sir, I am a Christian man, and stand among Christian people; I appeal to you, sir, with your hand upon your heart, and unknown to me and the meeting as you are, to say whether your intrusion here is dictated by that Christian feeling and that principle of conciliation which ought to be the characteristic of this great cause (cheers and uproar, during which Miller retreated several paces on the platform, followed by the bishop, who continued)—Is it, sir, your intention to cast a firebrand into this meeting? (Renewed confusion.) I can interpret that smile and nod (alluding to motions to that effect from Miller) into nothing but a belligerent and unworthy attempt to blunt the edge of this assembly's benevolence." The Right Rev. Prelate, shaking his hand and stamping violently on the floor, said he should indeed lament to hear if this object should be effected, and hastily left the platform, amid the disorder of the meeting. An attempt was subsequently made to renew the business of the meeting, but such was the determined resistance offered by the teetotallers that the noble chairman, after several ineffectual attempts to restore order, declared the proceedings adjourned, when the lights were extinguished, and the disturbers made their retreat.

Iron Lighthouse for Bermuda.—A guiding light is about to be thrown over the waters of the "still-vexed Bermuthes," from the lantern of a cast-iron lighthouse, which has just been constructed at the foundry of Messrs. Cottam and Hallen, Cornwall-road, Lambeth. The lighthouse is put together, with the exception of the lantern, and was last week shown to several scientific gentlemen. It is at present 180 ft. high, and when surmounted with the lantern its height will be increased 30 feet. The structure is composed of plates of cast-iron which are fastened together by iron bolts and screws, and it is ascended by an internal circular staircase. The diameter of the lighthouse at the bottom is 24 ft., which gradually diminishes to 15 ft. at the top, where the lantern is to be fixed. The weight of the whole is about 250 tons. It will occupy about six weeks to take the structure to pieces and pack it; and it is expected that after the foundation has been made for its reception, the lighthouse may be erected on the place of its final destination in two months.

Waterloo-bridge.—The half-yearly meeting of the proprietors of this bridge was held last week. A dividend of 12*s.* on each annuity was declared, and Mr. Romeo Coates brought forward a proposal to dispose of the bridge by lottery. His plan was as follows:—To issue a million of tickets, at 21*s.* each, and that the prizes should be limited to fifty; the fortunate holders should, by the terms of the lottery, make the best bargain they could, and sell the bridge to Government, on the condition that it should be thrown open to the public. The proposition was well received, and a special meeting will be called to consider the propriety of applying for an Act of Parliament to authorise its adoption.

City of London Conservative Dinner.—The festival of the City Association took place on Wednesday, in Covent Garden Theatre, the pit being floored over and raised to a level with the stage. Mr. Alderman Thompson presided, supported by several members of Parliament, and about 500 gentlemen.

Missions of the Free Church.—On Wednesday evening the first general meeting of the supporters of the Indian, Jewish, and Colonial Missions, in connection with the Free Church of Scotland, was held in Exeter Hall. P. M. Stewart Esq., M.P., was in the chair, supported by Sir J. Pirie, the Hon. and Rev. B. Noel, Dr. Cooke, of Belfast, &c. The Report stated that all the missionaries, formerly connected with the Established Church of Scotland, had joined the Free Church, except one, and that missionaries had been established in the capitals of the three Presidencies of India. In Calcutta the schools contained 1000 pupils, and in Poonah, Bombay, and Madras the number was considerable. Multitudes of heathen youth had entered the Christian church. Satisfactory accounts were given of the state of the missions to the Jews in Palestine, and to the Scotch population in the British colonies. The adoption of the Report was moved by the Rev. Mr. Sherman and carried unanimously.

Library of the Late Duke of Sussex.—It is at length arranged by the executors of his late Royal Highness, that the library, at Kensington Palace, shall be submitted to public auction by Messrs. Evans of Pall-mall. The first portion of the library, the sale of which will commence during the present month, includes his late Royal Highness's extraordinary collection of Bibles, and a large number of theological works. The Duke ordered that the library should remain untouched for twelve months after his decease, to give Government the option of making the purchase, and if not completed by that time, the collection was to be sold by auction. The prescribed period has now passed, and Sir R. Peel has declined to recommend the purchase.

The Duke of York's Column.—For these last few days some attention has been excited by the erection of scaffolding and ladders on the summit of this column, so as to be above the statue. It appears that it is intended to cleanse and beautify the figure, for the first time since its erection, and to protect it by the addition of lightning conductors.

Hungerford Suspension Bridge.—This structure is at length progressing rapidly towards completion; the eight lengths of patent wire rope have been carried over, and on Wednesday several of the directors were present, and witnessed the successful suspension of the first link of the massive chains which are to form the chief support of the bridge.

Firing of Hampstead Heath.—On Sunday evening the neighbourhood of Hampstead was much alarmed in consequence of a report that the heath had been set on fire. This statement proved true, and on a body of police arriving on the heath, they discovered the furze, at the rear of the Spaniards Tavern, and facing the Earl of Mansfield's, in flames, to the extent of between thirty and forty yards, and it was with considerable difficulty it was extinguished. Shortly before the fire broke out, a

gang of young fellows were seen near the spot, and it is supposed that they wantonly set fire to the heath, but the police have been unable to trace the parties.

Fires.—On Sunday night, a fire, attended with the loss of above five hundred quails, broke out in the cellar of a house in Turnmill-street, Clerkenwell, in the occupation of Mr. Davenham, an extensive dealer in pigeons, quails, &c., who a few months ago, by a similar accident, lost above one thousand pigeons. The lower part of the house was consumed, but the premises are insured.—On Wednesday a fire broke out in one of the new rows of houses behind Norland Crescent, Bayswater. Seven unfinished houses, with the piles of timber and carpenters' workshops, were consumed.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending June 1.—West Districts, 164; Northern, 173; Central, 151; Eastern, 170; Southern, 227; Total, 885. Weekly average for the last five years, 946.

Provincial News.

Bedford.—James Richards, the person charged with having passed certain notes, forming part of the property contained in a stolen banker's parcel, was on Friday finally examined, and committed for trial at Luton. His solicitor tried to induce the magistrates to accept bail, but they refused.

Bradford.—We noticed last week a murder committed on an inoffensive musician named Gott, who had attended a procession of some Orange clubs, by a mob of Irishmen in this town. After a long investigation before two of the magistrates of the West Riding, four Irishmen have been committed for trial at the ensuing assizes, on the charge of "Wilful Murder;" and a fifth has been admitted to bail, to answer a similar charge when called upon.

Bury St. Edmund's.—The practice of incendiarism still continues in this county, and several instances are reported from different districts. The *Times* newspaper, which last autumn sent down a reporter to trace the progress and causes of the outbreak in South Wales, has sent a correspondent into Suffolk to institute a similar inquiry into the incendiary fires.

Derby.—For some time past a number of ill-disposed persons have made it their business on public days to destroy the glasses which cover the labels in the Arboretum in this town. This has been done to such an extent as to warrant the suspicion that the mischief is not the consequence of a childish freak, but the result of a systematic determination to destroy property, which has been permitted to continue for a considerable time without being detected. The committee, in connexion with the authorities of the town, are taking steps to check the mischief, and discover the offenders.

Durham.—The colliers' strike is likely to be soon brought to a close, the coal-proprietors having determined to bring in fresh men unless the pitmen return to work immediately. Many have already acted on this notice, and returned to work; and it is expected that the majority will follow their example.

Eton.—The corner stone of the tower of the intended new building at Eton College will be laid by Prince Albert on Thursday next the 20th inst., with great ceremony. The Prince will arrive at the College about 11 in the morning, and attend divine service in the College Chapel, with the Provost and Fellows, the head master, and other dignitaries of the College, together with the whole of the students.

Guernsey.—The troops recently sent over to this island have been found unnecessary, the information given to Government respecting the state of the people having been greatly exaggerated. The arrival of fresh troops was so little expected, that no proper accommodation was prepared for them, and they were compelled to sleep on the barrack-floors of Fort St. George. They were consequently recalled, and returned last week to their old quarters in the Isle of Wight.

Lancaster.—Lord Francis Egerton's eldest son, the Hon. Geo. Granville Egerton, heir to the immense Bridgewater estates, will come of age on the 16th inst., when the event will be celebrated by great rejoicings on the noble Lord's estates in this county. The 16th falling on Sunday, the festivities will take place at Worsley on Saturday, and at Runcorn on Monday. A marquee is to be erected under which to dine 1000 persons, and the amusements will close by a display of fireworks.

Manchester.—In a recent Parliamentary Report, it was stated that numerous children in the manufacturing towns are annually killed by the indiscriminate use of Godfrey's cordial and preparations of laudanum. An instance of this kind was brought before the magistrates in this town last week, when Mr. Anderson, an apothecary, was committed by the coroner for trial on the charge of Manslaughter, for having supplied the wife of a weaver with a preparation of laudanum, from the use of which her child died.

Newport.—Some months ago information reached this country that John Frost, a former mayor of this town, who had been transported for life for having led the Chartist riots in South Wales, was sent to the penal settlement for attempting to escape. A letter has been lately received by his family, in which he states that he has been not only released from the penal settlement, but that the governor, in consequence of his good conduct, has promised to recommend him to be set free in the island. If he succeeds in obtaining his freedom, he will be allowed to follow any pursuit he may please, and the only restraint imposed upon him will be, that of being prevented leaving Van Diemen's Land. In the hope that such will be the case, his wife and children are preparing to join him in his banishment.

Romford.—The liabilities of Messrs. Johnson and Co., bankers, who have stopped payment, are said to be 35,000*l.*, on current and deposit accounts, and 17,000*l.* of circulation in promissory notes. The assets are said to be very limited, although considerable payments were made a day or two previous to the stoppage.

Southampton.—On Wednesday H.M.'s war-steamer Sydenham, arrived at this port from St. Petersburgh, having on board the late Ambassador, Lord Stuart de Rothsay and suite. His Lordship, who is far from well, immediately landed, and proceeded to his seat, Highcliff, near Christchurch.

Wakefield.—On Saturday, a bear about 3 years old, which had been confined in a pit in the Zoological Gardens in this town, suddenly leaped over the boundary, and got admission into the gardens. The proprietor, Mr. Hasselgrave, was from home at the time, but his wife and sister-in-law attempted to drive it back again, when it turned upon them, and worried them in a shocking manner. Assistance was fortunately at hand, and the bear was shot, but not before the females were so so much lacerated that for some days they were in great danger. The local papers state that it was sickening to see the eagerness of the bear in following the course where the females were carried, licking the blood as it went, and on reaching the room where they were placed, forcing its paws through the windows, and endeavouring to burst its way through them in pursuit of its prey.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1619*l.*; Birmingham and Gloucester, 2541*l.*; Eastern Counties, 4759*l.*; Edinburgh and Glasgow, 2403*l.*; Great Western, 18,909*l.*; Grand Junction, 8438*l.*; Glasgow, Paisley, and Ayr, 1594*l.*; Great North of England, 1624*l.*; London and Birmingham, 17,930*l.*; South-Western, 7118*l.*; Blackwall, 1328*l.*; Greenwich, 1838*l.*; Brighton, 4866*l.*; Croydon, 473*l.*; Liverpool and Manchester, 5553*l.*; Manchester, Leeds, and Hull, associated, 8611*l.*; Midland Counties, 3450*l.*; Manchester and Birmingham, 4441*l.*; North Midland, 5202*l.*; Newcastle and Carlisle, 1321*l.*; South-Eastern and Dover, 4137*l.*; Sheffield and Manchester, 1269*l.*; York and North Midland, 1895*l.*—A general meeting of the provisional committee for the construction of the new line of railway from London to York was held on Friday; the Earl of Winchelsea in the chair. The Report stated that the committee appointed for the purpose of adopting measures for amalgamating the two companies, then before the public, viz. the Great Northern Company, and the London and York, *viâ* Lincoln, each having in view the connecting the metropolis with the city of York, and ultimately with Edinburgh, had so far succeeded in their object, that henceforward the two companies would act together, and the committee had appointed Mr. Locke, the enginner, to decide upon the merits of the respective lines. The chairman said he fully concurred in all that the Report contained, and added that he should be happy to give his most cordial support to either line that the engineer might prefer; even though, regarding it in a personal point of view, the other might be more advantageous to himself. On the motion of Viscount Howick, seconded by Sir G. Strickland, the Report was agreed to; as was a motion appointing a committee of 24 gentlemen, with full power to take measures to carry out the undertaking. The committee was subsequently nominated, and, upon the motion of Mr. Denison, M.P., seconded by the Hon. O. Duncombe, M.P., a vote of thanks was passed to the chairman for his services in promoting the success of the company.—A public meeting was held on Friday, at the Council Chamber, Salisbury, when resolutions in support of the formation of a junction line from Salisbury, through Warminster, Trowbridge, and other intermediate towns, to the Great Western Railway, near Bath, were carried unanimously.—The number of persons who travelled by the Great Western on the Ascot Cup day was 16,766, besides 229 gentlemen's private carriages and 551 horses. The money receipts amounted to more than 4100*l.* The Great Western Extension Line to Oxford was examined by the directors on Monday, and opened to the public on Tuesday. The journey was performed in rather less than 2½ hours.

IRELAND.

THE STATE TRIALS.—The last "motion" in the State Trials was made in the Court of Queen's Bench on Monday. The Attorney-General attended on that day to argue in support of a demurrer to the assignments of error filed on the part of the traversers, as a preliminary step to the writ of error to be argued before the House of Lords. Sir C. O'Loghlen announced that it was not their intention to argue the case, but they should allow the demurrers to go by default, as the chief assignment had been argued and decided upon in the motion on the plea of abatement. Under these circumstances the Court ordered judgment to be entered for the Crown, and the trials have consequently closed so far as the tribunals of Ireland are concerned. Thursday, the 6th July, is the day fixed for opening the case in the House of Lords.—The weekly meeting of the Repeal Association took place on Monday; Lord Ffrench was in the chair, and said that Mr. O'Connell had been sacrificed to the insatiable vengeance of an infuriate faction, whose distinguishing characteristic was inveterate hatred of Ireland, Irish interests, and in fact everything Irish. What Irishman could behold unmoved such a spectacle as the incarceration of him, who for half a century had devoted the powers of his gigantic mind to the amelioration of Fatherland, which for centuries previously had groaned beneath the iron hoof of alien domination. After some further remarks in a similar strain upon Mr. O'Connell's imprisonment, his Lordship stated that he had come up to town for the sole purpose of presenting "the Liberator" and his fellow-martyrs with two addresses from parishes in his county, the inhabitants of which were boiling with indignation at O'Connell's unjust and unmerited conviction, and had resolved, "come weal, come wo," that on their parts there should be no shrinking. Mr. H. Grattan, M.P., having given in a subscription of 5*l.*, said that on his way to meet them, he had passed through London, and by design had abstained from entering the House of Commons. Englishmen would probably say, that after the respect which they had paid to the memory of his father, it was a bad return that the son should neglect his duty on a debate important to their interest. He had met many Englishmen during his travels whom he respected and loved, and he would always love Englishmen in the same degree that they loved his countrymen, but he would also hate them when they displayed a hatred of Irishmen, and though they had the bones of his father, they should never have those of the son. A year had passed since he left Ireland, and during that period he had visited many countries, and nowhere did he find one party set against another. Sectarian prejudices were unknown; all was unanimity, peace, and prosperity. It was for this country, blessed, forsooth, with a constitution, and boasting of the trial by jury, that everything that was bad in human nature should develop itself. What are the words of the English Tory papers? Did they not call the Irish people savages, and their priests surpliced ruffians, and a demon priesthood? So long as they continued to give vent to these expressions, so long would he hate the English people, because he considered these papers as the friends of that people, for they were supported by them. He then proceeded at considerable length to detail the injustices which England had inflicted on Ireland, and concluded by announcing his intention—firm as if he had taken an oath—that he would never enter the House of Commons unless driven there by the injunction of his constituents. Mr. T. M'Nevin (barrister-at-law), having detailed the substance of an answer given by Mr. O'Connell to an address which he had presented to him from the Association, proceeded to attack the Emperor of Russia, whom he described as brought over by the gaolers of O'Connell, from his occupation of fetter-forging and peopling Siberia, to enjoy a bear-hugging with Prince Albert in a lobby. A great number of large sums of money was announced to have been received from the wards of the city of Dublin, and various localities throughout the country, in which meetings of sympathy have been held, and a letter was read from Lord Stourton inclosing a remittance. Mr. S. O'Brien, M.P., read an address from the Complete Suffrage Union of England, signed "Joseph Sturge," and expressing indignation at the imprisonment of Mr. O'Connell, and moved that it be referred to the committee of the Association to prepare a suitable reply. The hon. gentleman said that he could assure them from personal experience that Mr. O'Connell was in high health and spirits. He had the happiness of spending the previous evening with him, and he could assure them that his feelings regarding his present situation were those of unbounded exultation. It was now whispered through town that Government, not content with imprisoning O'Connell, intended to prevent the Association from meeting in that hall, by issuing a proclamation against it. Although it was rather unusual to do so, he would open a part of the tactics of the Association, and he told their enemies that it was the determination of the committee of the Association to try the legality of such a proceeding by an appeal to a jury of their fellow-countrymen, by way of civil action, and also by way of defence to any criminal proceedings against them. In the event of a proclamation being issued against the Association, the intention was to call a meeting of it, and he begged that he might be permitted to take the chair on that occasion. He then proceeded to impress upon his auditory the necessity of preserving the peace, whatever measures the Government might choose to take against their friends. The total amount of contributions on the "second week of the captivity" was announced to be 3200*l.*—Several of the Roman Catholic bishops have ordered public prayers to be offered in their chapels on behalf of Mr. O'Connell, and many of the local corporations have held meetings to petition the Queen for his release from prison.—Nothing further has transpired respecting the alleged suppression of the Repeal Association, but notice has been given that no person wearing Repeal buttons will be allowed to enter the barracks or quarters of the troops.—On Thursday a procession of from 20 to 30 vehicles, filled with corporate authorities, proceeded to the Richmond Penitentiary to present addresses of condolence to Mr. O'Connell. They contained deputies from Cork, Limerick, Waterford, Galway, Kilkenny, Clonmel, Ennis, New Ross, Carrick-on-Suir, Fethard, Fermoy, and Kelly. On reaching the prison the Mayor of Cork went up the steps, where the Governor of the prison was standing to receive him, and asked admittance. The Governor courteously stated that he could allow no deputation to enter the prison for the purpose of presenting an address to any person confined in it, but he was happy to say that Mr. O'Connell and his friends were in good health. The Mayor and deputation then left their cards, thanking the Governor for his courtesy. The other Mayors and deputations went through the same ceremony in succession, but the Mayor of Limerick protested against the regulation, and was loudly cheered by the crowd. The procession then returned in the same order.

Limerick.—On Friday the Mayor of this city was entering the Exchange to preside at a meeting which he

called in compliance with a requisition to address Mr. O'Connell in his captivity, when he was suddenly taken ill, and died almost immediately. Death was caused by the rupture of a blood-vessel.

Law.

HOUSE OF LORDS.—COMMITTEE FOR PRIVILEGES.—*The Sussex Peerage.*—On Thursday, the committee assembled, the Earl of Shaftesbury in the chair, to hear further evidence in support of this case. Nearly all the judges and law lords were present. The first proceeding was the production of the patent of nobility to the Duke of Sussex. The grant was to his Royal Highness and the heirs-male of his body, lawfully begotten and to be begotten. The creation in the first instance was that of Earl of Inverness. It was issued under the Great Seal of Great Britain. The dukedom of Sussex was granted in like manner. Mr. Walker, who was comptroller of his Royal Highness's household, proved a document dated April 4, 1793, to be in his handwriting. The paper, which was dated at Rome, and signed Augustus Frederick, was produced. It was the paper read in the argument on the former day, as constituting the *sponsalia*. It was as follows:—"As this paper is to contain the mutual promise of marriage between Augustus Frederick and Augusta Murray, our mutual names must be put here by us both, and kept in my possession; it is a promise neither of us can break, and is made before God our Creator and all-merciful Father. On my knees before God our Creator, I, Augustus Frederick, promise thee, Augusta Murray, and swear upon the Bible, as I hope for salvation in the world to come, that I will take thee, Augusta Murray, for my wife; for better for worse; for richer for poorer, in sickness and in health; to love and to cherish till death us do part; to love but thee only and none other; and may God forget me if I ever forget thee. The Lord's name be praised! So bless me! So bless us, O God! And with my handwriting do I, Augustus Frederick, this sign, March the 21st, 1793, at Rome, and put my seal to it, and my name.—(L.S.) AUGUSTUS FREDERICK. (Completed at Rome, April 4th, 1793.)" Another paper, likewise in the Duke's handwriting, was put in. It was the same in every respect but this, that the former had the words "completed at Rome," whereas in this the phrase was "married at Rome." Numerous letters were then put in and read, after the handwriting had been authenticated, in which the Duke of Sussex constantly styled Lady Augusta Murray, the mother of the claimant, as "my wife," and "my love." These letters were of the strangest character as compositions, filled with rhapsodies of his affection, declaring that he would die, unless he married her immediately; and constantly reiterating the fact sought to be established, viz., that he regarded her as his wife. Letters were also produced, in which he addressed the claimant, Sir Augustus D'Este, as "My dear son." Mr. Gunn, the son of the clergyman who performed the ceremony, and others, were examined at great length, and after a long discussion on the particular character of the evidence to be admitted, their lordships postponed the further hearing of the case to the 25th inst.

Annandale Peerage Case.—Counsel were heard on Tuesday on this case, after which the Lords gave judgment in the matter, declaring that, by the law of Scotland, the phrase "heirs-male" did not mean, with regard to honours, what they would mean in a similar case in England, heirs male of the body; but meant heirs-male general. Their lordships went into a very learned and elaborate discussion of the rules of construction of grants of lands and honours in Scotland, and found that, by those rules, the construction now stated must be put upon the first of the three patents granted in this case, and therefore overruled the others. The effect of this judgment was, to extinguish the claims of all the claimants, except that of Fred rick Johnstone, now a minor. The committee then passed a resolution to this effect.

CENTRAL CRIMINAL COURT.—*The Buckingham Palace Case.*—*Elizabeth Lindsay*, aged 37, *Ellen Lindsay*, 33, and *Dr. James Lindsay*, 60, surgeon in the navy, were charged, Elizabeth and Ellen with stealing several blankets, sheets, counterpanes, and linen, value 40*l*., the property of the Queen; and James, their brother, with feloniously receiving the same, well knowing them to have been stolen. The Solicitor-General, in opening the case, made a feeling allusion to the length of time which the female prisoners had been in the service of the palace, but was interrupted by the elder fainting. After some delay she was sufficiently recovered to be again placed at the bar, where both herself and her sister were accommodated with chairs. The Solicitor-General then detailed the nature of the case, and stated that they were charged with abstracting linen from the Palace, of which the females were housekeepers, and taking it to the male prisoner, their brother, who lived near. The defence proceeded on the ground that great part of the linen belonged to the prisoners, and that the rest, marked with the royal initials, had been given to them by the late Sir T. B. Mash, Comptroller of the Household. Mr. Kelly, on behalf of Dr. Lindsay, having been heard for the defence, Mr. Murchison, President of the Royal Geographical Society, Mr. Stillwell, navy agent, Mr. Hobber, clerk of the Admiralty, Mr. Dobey, surgeon, R.N., and Mr. Slade, a member of the Stock Exchange, gave Dr. Lindsay the highest possible character. The Solicitor-General replied, commencing by admitting that with regard to the female prisoners there was not the slightest stain upon their characters prior and up to the present transaction. Mr. Baron Gurney summed up the evidence, and the jury, after three hours' consultation, returned a verdict, which the foreman pronounced with very marked emphasis, of Not Guilty in favour of all the prisoners. The verdict was received with cheers and clapping of hands. The Recorder said he would commit any person making such an improper display. A jury returning a verdict according to the evidence and their consciences should not be either censured or applauded. On the delivery of the verdict both the female prisoners fainted.

POLICE, BOW-STREET.—*Count Ostrowski*, a Polish exile, was brought before the magistrates last week on the charge of using violent and threatening language towards the Emperor of Russia, and was held to bail, himself and two sureties, in large sums for his future good behaviour. According to a statement since published by the Count himself, it appears that on Monday last Count Ostrowski called at his tailor's, Mr. Inkson's, in Ryder-street, St. James's, and observing a pair of trousers of rather striking appearance lying on the counter, he happened to inquire for whom they were intended. He was informed they had been ordered by the Emperor Nicholas; at which Count Ostrowski expressed some surprise, and added, in a jocular manner, that he should like to have the trying of them on. Mr. Inkson, or his shopman, converted this remark into a threat against the life of the Emperor; and it was on this accusation that Count Ostrowski was arrested. He was some hours in confinement before bail could be procured; but as soon as the required sureties were completed, he was at once liberated. —A man named *Oliver Walsh*, a carpenter, from Dublin, has been committed to prison, in default of bail, for sending a letter to Sir R. Peel, threatening, if justice were not awarded him, that he would "leave some of the authorities in Ireland as sad a tale to brood over as ever the family of Mr. Drummond had." He is supposed to be insane.—A mysterious case is now under consideration at the Thames-street Police-office and before the Coroner's Court, *Mr. James Cockburn Belaney*, a surgeon, being charged with wilful murder, in causing the death of his wife, Mrs. Rachel Belaney, by administering to her prussic acid. The case has been reported at great length, but the main facts are, that the deceased lady and her husband had come to town from Westmorland, and taken lodgings in Stepney. The lady, a woman of great personal attractions, to whom the prisoner was affectionately attached, was far advanced in pregnancy, but in perfect health; when on Saturday she was taken suddenly ill, and died in a few hours. The body was examined, and prussic acid ascertained to be the cause of death, but the surgeons did not communicate their discovery to the husband. On Monday evening, however, he called upon one of them and stated that he had himself been in the habit of taking prussic acid, and had broken the bottle, but being anxious to be careful with the remainder he had put it in a tumbler on the drawers, and his wife had drank it in his absence by mistake. It appeared, however, that he had written a letter to a friend in the country giving a different account of her death. Much additional evidence has been given, but the prisoner is still remanded, and the result will not be known for some days. The prisoner is a person of some literary pretensions, and has published a book on Falconry.

SPORTING.

ASCOT RACES.—The stewards of these Races held a meeting on Friday, when John Day's objections to Bloodstone, the winner of the New Stakes, were gone into. They were three in number, viz., that he is more than two years old; that his owner, or part owner, is in arrear for stakes; and that his nomination is wrong as to pedigree. The whole case turned upon the first point; and Messrs. Field and Parry, veterinary surgeons, having, on examination of his mouth, unhesitatingly given an opinion that he is three years old (Old England having also been inspected by them, and pronounced to have a two-year-old mouth), the stewards awarded the stakes to John Day. They went into the evidence with regard to the instructions given by Mr. J. Newman, and passed a resolution that Mr. Newman was proved to have given orders to Bell to lose the race, and that the latter's conduct, first in mentioning the circumstance to his master (Planner), and afterwards in riding to win, was highly creditable to him. The consequence of the decision as to the age is, that the bets, as well as the stakes, go with Old England. It has since, however, been announced that Mr. F. Herbert, the owner of Bloodstone, has commenced proceedings against the stakeholders for the recovery of the New Stakes, those who had bets on the race having paid and received in accordance with the decision of the stewards.

BIRTHS.—3d inst., at Little Yeldham, Mrs. J. GASELEE, of a son—3d inst., at 14, Lower Belgrave-street, Mrs. W. GREIG, of a son, still-born—3d inst., at Wonston-rectory, Hants, the lady of the Rev. A. B. HILL, curate of Wonston, of a daughter—4th inst., at Brixton-hill, Mrs. H. HENDERSON, of a daughter—5th inst., the lady of CAPT. B. W. GOLDIE, Bengal Engineers, of a son—6th inst., at Huddersfield, the lady of the Rev. GEO. S. HOOKEY, of a daughter—6th inst., at Chatham, the lady of Brigade-Major J. D. O'BRIEN, of a daughter—7th inst., at Cheshunt, Mrs. P. SMITH, of a son—7th inst., at 82, Camden-road-villas, Mrs. J. HALL, of a son—7th inst., at Delvediere, Frant, Sussex, the lady of J. PRYCE, Esq., of a daughter.

DIED.—1st inst., at Rome, after a few days' illness, LADY ADAM, wife of Lieut.-Gen. the Right Hon. Sir F. Adam, G.C.B. —5th inst., Lieut.-Gen. J. BROWN, of the Bombay Army—5th inst., at Reading, T. COLES, Esq.—5th inst., in Albemarle-street, BARBARA, BARONESS DE MAULEY. Her Ladyship was the only child of Anthony, fifth Earl of Shaftesbury, by Barbara, only daughter of Sir John Webb, of Canford, in the county of Dorset, and married in 1814 the Hon. William F. S. Ponsonby, third son of Frederic, Earl of Besborough, created a Peer at the coronat on of her Majesty - 6th inst., in New Steine, Brighton, FRANCES KNIPE, youngest daughter of the Rev. R. R. Knipe, of Hookfield Grove, Epsom, and rector of Water Newton, in the county of Huntingdon—6th inst., at his residence, at Bushey, Herts, P. LOVEKIN, Esq, late of Droxford Manor-house, Hampshire, aged 59—6th inst., G. B. WATSON, Esq., of Clapham-Park, aged 59—6th inst., CHARLOTTE KIRBY, the beloved wife of the Rev. W. Kirby, rector of Barham, Suffolk—6th inst., at Succoth, Dumbartonshire, LADY CAMPBELL, wife of Sir Arch. Campbell, Bart.—6th inst., at Cheltenham, J. RANKING, Esq., formerly of St. Petersburgh, aged 76—6th inst., after a long and painful illness, ESTHER HARRIS, eldest daughter of Mr. J. Harris, of Abingdon, Berks, draper—7th inst., at Norwich, Mrs. MARIA MARTIN, aged 79.

PARR'S LIFE PILLS,

THE BEST MEDICINE IN THE WORLD, are now established as the only *certain* cure of disease in the human frame. Sufficient has already been advertised in the public prints to convince any reasonable person that the efficacy of this Medicine is unbounded, and that every disease will soon vanish from the effects of this popular remedy. Already the Proprietors have received and published 26 different sheets of Testimonials; and, besides, have received some thousands of letters confirming all the statements published, and proving the immense benefit derived by all classes by taking PARR'S LIFE PILLS. Testimonials are received daily, and it would be impossible in a newspaper to publish one-half received; and the following are selected as people well known in their respective neighbourhoods, and whose testimony is unquestionable. Further sheets of Testimonials may be had, gratis, of all Agents.

IMPORTANT TESTIMONY of an old Man in his 77th year, received by Messrs. MOTTERSHEAD and Co., Manchester, and forwarded to the Proprietors of PARR'S LIFE PILLS.

I, THOMAS BARLOW, gratefully testify to the great benefit I have derived by taking PARR'S LIFE PILLS. I had been out of health for many years; sometimes unable to work, and on the sick club. I had a bad complaint at the stomach, with a violent cough, and at various times was under different medical men, including the noted Dr. Newbold of the Chorlton Dispensary; but my case seemed hopeless, as they none of them could cure, or give me much relief, and I had no hopes left of being better on this side the grave; however, quite unexpected, the deliverer came at last (Old Parr's Recipe). I got a box of his Pills and found immediate benefit from the first box, and continued them for several months with increased good until this time, and now I feel myself wonderfully well, and am strong in body, have a good appetite, and though in my 77th year, I am able to get my own living in the employ of Mr. Mee, farmer, Withington, (as a farm labourer.) I am satisfied that my recovery is to be ascribed entirely to the restorative qualities of PARR'S LIFE PILLS, and as a proof of my great age, subjoined is a copy of my baptismal register.

BAPTISM, 1767.—THOMAS, Son of JAMES and MARTHA BARLOW, of Hale, Cheshire, was Baptised the 27th day of November, in the year of our Lord 1767.

From the Parish Register—F. BOWDON.
Signed—JOHN BALDWIN, Vicar.

CAUTION TO THE PUBLIC.

*** Beware of Spurious Imitations of the above medicine. None are genuine unless the words, "PARR'S LIFE PILLS," are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane Court, Fleet-street, London," on the directions. Sold in boxes, at 1*s*. 1½*d*., 2*s*. 9*d*., and family packets, 11*s*. each.

PIANOFORTES.

LUFF & CO., MANUFACTURERS, 103, Great Russell-street, Bloomsbury. The cheapest house in London for a first-rate warranted Pianoforte.—Free use of case, and exchange allowed.—LUFF AND CO, 103, Great Russell-street, Bloomsbury

WANTED, at Michaelmas next, a Man and his Wife, free of all encumbrance. The Man must understand stock and farming; the Woman milking, cheese, and butter-making, also the care and rearing of poultry. None need apply who cannot give the highest and longest reference for character, as X. Y. will make all inquiries in person. Honesty, industry, and very good temper, are the greatest requisites, as all their movements will be directed for them.—Direct to O. O., Office of this Paper.

Patronised and sanctioned by HER MAJESTY THE QUEEN, H.R.H. PRINCE ALBERT, the Royal Family, and the several Sovereigns and Courts of Europe.

ROWLAND'S MACASSAR OIL, for the Growth and for Preserving and Beautifying the Human Hair. Price 3*s*. 6*d*.; 7*s*.; Family Bottles (equal to four small), 10*s*. 6*d*., and double that size, 21*s*.

Caution.—The words "Rowland's Macassar Oil" are engraved on the Wrapper of each genuine bottle; and on the back of the Wrapper 1500 times, containing 29,028 letters. Without this "None are genuine."

ROWLAND'S KALYDOR for Improving and Beautifying the Skin and Complexion. Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

ROWLAND'S ODONTO, or PEARL DENTIFRICE renders the Teeth beautifully white, and preserves the Gums. Price 2*s*. 9*d*. per box, duty included.

Caution.—Spurious imitations are frequently offered for sale as the Real Articles. It is therefore necessary on purchasing to see that the word "ROWLAND'S" is on the Wrapper of each. For the protection of the Public from fraud and imposition, the Honourable Commissioners of Her Majesty's Stamps have authorised the Proprietors' Signature to be engraved on the Government Stamp thus—

A. ROWLAND & SON, 20, HATTON GARDEN; which is affixed on the KALYDOR and ODONTO. Sold by them and by all Chemists and Perfumers.

*** All others are FRAUDULENT COUNTERFEITS!!!

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER.—Mr. GEORGE MILLS, Gardener, Gunnersbury Park, Acton, Middlesex, can with all confidence recommend a young Man to any Nobleman or Gentleman in want of a competent and trustworthy servant in the above capacity. He is 27 years of age, and has served him two years in the above establishment.

AS HEAD GARDENER.—A Scotchman, 29 years of age, and married. He has had great experience in Horticulture in all its branches. Every satisfaction can be given as to abilities, sober habits, &c., from the lady he has just left. Direct to R. R., 28, Buckingham-st., Strand, London.

AS HEAD GARDENER.—A middle-aged, married Man, without family, who perfectly understands his business in all its various branches, including Pines, Vines, and Greenhouse Plants. Is a native of North Britain; has no objection to any part of the country. Can have an unexceptionable character from the gentleman he lately left.—Direct to L. M., Mr. Dorsett, Grocer, Clapham, Surrey.

AS GARDENER.—A Married Man, aged 35, without encumbrance, who understands Forcing, Flower and Kitchen Gardening in all its branches, can take charge of land, and can be highly recommended from the gentleman he has left—Direct to J. H., Mr. Rollison, Nursery, Tooting, Surrey.

AS GARDENER.—A married Man, aged 40, without incumbrance, who has a good practical knowledge of Pines, Grapes, Forcing, and Gardening in all its branches; can take the management of land and cattle if required, and can have an unexceptionable character from the family he has just left.—Direct to C. D., at Messrs. Henderson and Co.'s, Pine-apple-place, Edgeware-road.

AS GARDENER.—A single Man, aged 26, who understands his profession, both in the Kitchen and Flower-garden, and the Propagation of Plants and all kinds of Early Forcing. Can have four years' character; is leaving his situation on account of the decease of his employer.—Direct to G. M., Mr. J. Howe, Esq., No. 7, Skinner-street, Clerkenwell.

AS GARDENER.—A respectable, active, married Man, aged 49, who perfectly understands his business in its different branches. Has lived with a Nobleman 16 years; left on account of his death. Has a slight knowledge of Farming—sufficient to superintend under a person who is his own Farmer.—Direct to A. Z., Mr. Woodham, Newspaper Office, 9, Rosamond-buildings, Islington.

AS GARDENER.—A married Man, without incumbrance, of sober habits, who perfectly understands his business in all its branches. The Wife, as good plain Cook, or to take care of the House when the family is from home, if required; or a weekly place. No objection to any distance in the country. Can have good characters from their last situations.—Direct to A. B., 2, Dacre-street, Lee, Kent.

AS GARDENER.—A single Man, aged 28, who has a thorough good practical knowledge of his business, and can have three years' unexceptionable character from the gentleman he has just left. No objection to any part of England.—Direct to A.B., Post-office, Ball's-pond, Islington.

AS GARDENER.—A young Man who has a practical knowledge of his profession in all its branches. Can be highly recommended from the gentleman he has just left.—Direct to R. C., Mr. Carter, No. 238, High Holborn, London.

AS GARDENER.—JAMES CRUIKSHANK, Gardener to the Earl of Lonsdale, at the Castles of Lowther and Whitehaven, in consequence of the decease of his late venerable Employer, will be at liberty to ENGAGE with any Nobleman or Gentleman after the 30th inst. He has had the entire management of his Lordship's Gardens, in all the various departments, for the last six years; has had great experience in Forcing, and is well acquainted with flowers. Any Nobleman or Gentleman contemplating extensive improvements, or requiring a Gardener in the highest departments of his profession, on applying, will meet with due attention. Can produce the highest testimonials; is married, and has a family. —Direct to him at Lowther Castle, Penrith, Westmoreland, until the 4th of August.

AS GARDENER.—A single Man, about 30 years of age, who is perfectly acquainted with his business in every department; and, from his long experience in some of the best forcing establishments in the country, he is confident he will give every satisfaction. The most unexceptionable testimonials will be given as to abilities and character.—Direct to A. M., Mr. JACKSON'S Nursery, Kensington.

AS GARDENER.—A married Man, without incumbrance, who understands Forcing, and can have a 13 years' character. His Wife could take the situation of Housekeeper, if required.—Direct to T. S., Mr. Maund, Bromsgrove.

AS GARDENER.—A young Man, aged 30, who understands his business in all its branches; he can take charge of brewing if required. Can have two years' character from the gentleman he has just left.—Direct to A. B., Mr. PAMPLY, Nursery, Lavender Hill, Wandsworth-road, Surrey.

A GENTLEMAN whose Garden has been long known and admired—(from an alteration in his family)—is desirous of getting a place for his Gardener, who is a married Man with two children; a good general Gardener, and accustomed particularly to the growth of Geraniums and decorative Gardening. For further reference apply to Mr. KNIGHT, Exotic Nursery, Chelsea.

TO GARDENERS.

A YOUNG MAN, who has a knowledge of Gardening, wishes to Article himself for two or three years. A moderate premium will be given.—Direct to F. L., 26, Margaret-street, Clerkenwell, London.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

THE ROYAL BOTANIC SOCIETY, under the Patronage of HER MAJESTY THE QUEEN, HER MAJESTY THE QUEEN DOWAGER, Her Royal Highness the DUCHESS OF KENT, Her Royal Highness the DUCHESS OF GLOUCESTER, Her Royal Highness the DUCHESS OF CAMBRIDGE, His Royal Highness PRINCE ALBERT, of Saxe Coburg and Gotha, K.G., and His Royal Highness the DUKE OF CAMBRIDGE, K.G., is incorporated by Royal Charter, for the promotion of Botany in all its branches, and for the formation of extensive Botanical and Ornamental Gardens within the immediate vicinity of the Metropolis. The Society's last Exhibition of Plants and Flowers during this Season will take place in the Gardens of the Society, Regent's-park, on Tuesday, July 2. An Exhibition of Microscopes, to illustrate the Structure of Plants, is also introduced. Tickets can be had only by orders from Fellows. Price, before the Day of Exhibition, 5s. each; and on the Day of Exhibition, 7s. 6d. each. Offices for the Sale of Tickets, at the Botanic Gardens, Regent's-park, and next week at 28, Regent-street. Fellows and Members are admitted without tickets, upon signing their names in the Gatekeeper's Book. Should the weather prove wet, a new gate, connected with the Tents, will be opened to admit the company to view the Plants without being exposed to the rain.

J. D. C. SOWERBY, Secretary.

*** The Fellows and Members are informed that on Tuesday, the 25th inst., a Military Band will attend in the Gardens, upon which occasion Visitors can only gain admission through the introduction of Fellows.

FLOWER SHOW.—The WEST LONDON GRAND FLORICULTURAL EXHIBITION, under the Superintendence of Mr. J. T. NEVILLE, of Ebenezer House, Peckham, will be held in the Grounds of the Almshouses of the Butchers' Charitable Institution, at Walham Green, Fulham, on Tuesday the 25th, and Wednesday the 26th of June, in Aid of the Building Fund, for Prizes of 2 Silver Cups, and 29 Silver Medals. Lists of the Prizes and Rules may be obtained by application to Mr. Neville.

WOOLWICH FLORAL SOCIETY.—Under the distinguished patronage of the Right Hon. Lord Bloomfield, G.C.B., & K.C.H. The First Exhibition of this Society for the year, will take place at the TOWN HALL, WOOLWICH, on Wednesday, June 26, 1844, when Prizes in Plate, to the amount of 12 Guineas, will be presented to the successful competitors after the Dinner, which will be held at the Bull Tavern, at Six o'clock. First Class.—Nurserymen and Growers for sale. For the best, 2d best, and 3d best Stands of 12 Dissimilar Blooms of Pinks. Entrance to Non-members, 5s. Second and Third Class, for Pinks and Pansies, will be confined to Members only. Open to all classes.—For the best and second best Seedling Pinks; for the best and second best Seedling Pansies. Entrance to Non-members, 1s. each bloom. The Censors will be instructed not to award Prizes to Seedlings, unless they possess superior properties. Persons intending to exhibit, are required to send notice of such intention to Mr. Frost, the Secretary, Bull Tavern, Woolwich, on or before Monday, 24th inst. The Flowers to be ready for the Censors at One o'clock precisely. The Public will be admitted at Three o'clock by Tickets, to be obtained gratuitously of Mr. Newhall, Pearl-street; Mr. Chatwin, Plumstead; Mr. Norman, Bull Inn-yard; and of the Secretary at the Tavern, where also may be obtained Tickets for the Dinner, at 3s. each. The Rules of the Society, which will be strictly adhered to, may be seen on application to the Secretary.

THE SECOND EXHIBITION for the SEASON of the BEBINGTON HORTICULTURAL SOCIETY will take place on FRIDAY, the 19th JULY, in the Pleasure-Grounds of the Royal Rock Ferry Hotel, Cheshire, when numerous Prizes will be awarded to the various specimens of Flowers, Fruits and Vegetables in season. Boats ply from Liverpool to the Rock Ferry every quarter of an hour on the day of Exhibition.

ROSES IN BLOOM.—WOODLANDS NURSERY, MARESFIELD, near UCKFIELD, SUSSEX.

WM. WOOD & SON beg leave respectfully to invite the attention of the Nobility, Gentry, and Amateurs to their extensive Nursery Stock, extending over Forty Acres of Ground, Fourteen of which are cultivated with ROSES, now coming into splendid bloom, and will continue in flower during the Rose season.

There is a carriage drive through the Nursery, with arbours fitted up for the accommodation of parties desirous of inspecting the Roses.

Admittance GRATIS daily (Sundays excepted). The Lewes Coach passing through Maresfield leaves the Golden Cross, Charing Cross, every Tuesday, Thursday, and Saturday morning, returning the alternate days.

Maresfield is 12 miles distant from Hayward's Heath station of the London and Brighton railway.

JOHN STANDISH, NURSERYMAN, Bagshot, begs to inform his Friends and the Public that he is now sending out his SEEDLING FUCHSIAS, which he can strongly recommend, four of which, marked with an asterisk, are the largest yet sent out. See Paxton's "Magazine of Botany" for March.—Also now ready, his new SALVIA BICOLOR, which he has proved to be perfectly hardy, and one of the most beautiful showy herbaceous plants of the present day. Likewise a New Pink GERANIUM, for Bedding, which was raised from the Frogmore Scarlet, being exactly like that plant in habit, foliage, and shape of flower, only of a delicate pink colour with a white eye.

SEEDLING VERBENA, "ENCHANTRESS" (ALEXANDER'S), pink with white centre, truss large and fine form. For description of this beautiful variety, see Editor's opinion, *Gardener's Chronicle*, No. 22, page 360. "*J. A.*—Your seedling Verbena, 'Enchantress,' blush or pink, is a beautiful variety; truss large and well-formed; the flowers flat and large, with a fine surface and delicate colour. One of the best of the light varieties." Blooms may be seen, and plants had, 5s. each, of Messrs. WARNER and WARNER, Cornhill; CLARK, Bishopsgate-street; and of W. ALEXANDER, Lamb Farm, Kingsland.

ROSES, RUGBY NURSERY, WARWICKSHIRE.

J. COLE begs leave respectfully to invite the attention of the Nobility, Gentry, and Amateurs, to his superb Collection of Roses, which will be in full bloom about the 24th inst., and continue through the Rose season.

Nurseries, Sawbridgeworth, Herts, equidistant from the Harlow and Sawbridgeworth Stations, on the Northern and Eastern Railway.

T. RIVERS, jun., respectfully informs his Friends that his Collection of ROSES are now in full bloom. There are seven down trains daily to the above stations.

June 20, 1844.

FLORICULTURAL SEEDS.

J. CARTER, SEEDSMAN AND FLORIST, No. 238, High Holborn, London, begs leave to recommend the following Seeds for present and autumn sowing. The Annuals he has selected will flower in the autumn if sown this month. He would recommend a second sowing early in September; for those sown in the autumn will flower earlier, and much finer, than the spring sown, particularly in dry seasons like the present.

1.—HARDY ANNUALS IN ASSORTMENTS.

8 fine Calliopsis	2s. 0d.	8 fine Schizanthus	2s. 6d.
8 — Clarkia	1 6	20 — *German Stocks	3 6
12 — dwarf Larkspur	2 6	8 — *Tenweek	2 0
8 — tall Larkspur	1 6		
7 — Nemophila	2 0	40 — hardy Annuals	3 0
8 — Godetia	1 6	20 — ditto	1 0
6 — Gilia	1 0	10 — ditto	2 0

* All Stocks require protection in winter, the others not.

2.—HARDY BIENNIALS AND PERENNIALS.

8 fine Campanula	2s. 0d.	12 fine *Queen Stocks	3s. 6d.
8 — Dianthus	2 0	6 — ditto	2 0
8 — Pentstemon	2 0	5 — *Brompton	2 0
8 — new Scabious	2 0	40 — Perennials	10 0
6 — Anterhinum	1 6	20 — ditto	5 0
6 — Aquilegia	1 6	10 — ditto	2 6
20 — Hollyhock	4 0		

3.—GREENHOUSE SEEDS.

10 fine Sorts	4s. 0d.		Per packet.
8 — Climbers	4 0	Finest mixed Cineraria	1s. 6d.
8 — Alstræmeria	4 0	— Calceolaria	1 6
4 — Thunbergia	2 0	— Gloxinia	1 6
3 — Portuluca	1 6	— Erica	2 6
3 — Tropæolums	2 0	— Gladiolus	1 6
		— Verbena	1 0

And most other Flower Seeds contained in his General Catalogue for 1844.

*** A comprehensive Catalogue of Dutch Bulbs will be published at the usual time.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains occasionally dissolved in the water used with Plants produce a vigorous growth and splendid flowers. If what is called a "*Liquid Guano*" is desired, a superior article is obtained at a less usual cost. Dissolving Half a Bottle of this powder in a *quart of water*, and using a table-spoonful to a gallon in watering flower-beds. See *Gardeners' Chronicle* for last week, page 390. *Sold in bottles, 1s. 9d. each*, by Chemists and Seedsmen. Agents, DAVY, MACKMURDO and Co., 100, Upper Thames-street, London.

MAGICAL EFFECT ON FLOWERS.—*Gardeners' Chronicle*, April 27th.—"I cannot speak of POTTER'S LIQUID GUANO in adequate terms of praise. I tried it on Hyacinths, and other Flowers. The effect was magical. My flowers were the finest I ever beheld, and they preserved their beauty nearly double their usual time."—*W. Kidd, Hammersmith.*

Sold by SAVORY & MOORE, 136, New Bond-street; WARNER, 28, Cornhill; and by most Chemists and Seedsmen.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, is still making the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, at 5s. 6d. each, or 3l. per dozen. Early in July A. P. will make the Milk-Pans of green glass of excellent quality, at 42s. per dozen.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

THE following Articles, manufactured in Slate for Horticultural purposes, may be seen in use at Worton Cottage, upon application to the gardener (Sundays excepted).

Tank Covers	Bottoms for Frames
Cisterns	Boxes for Balconies and Verandahs
Shelves	Orange Tubs, Flower Boxes, &c.
Garden Edging	

EDWARD BECK will be happy to answer any inquiries either personally or by post.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITION at the GARDEN, June 15th, 1844.

INSTRUCTIONS TO THE JUDGES AS TO THEIR CONSIDERATION OF THE NOVELTY OF THE OBJECTS EXHIBITED.

IN forming your opinion of the subjects submitted to you for examination, you are requested to take into consideration whether they have been exhibited previously or not. The OBJECT of this regulation is to give specimens produced at the Society's Garden Meetings, for the first time, an advantage over others previously exhibited, although of equal merit; and to obstruct the system of exhibiting very fine plants repeatedly, to the disadvantage of others. The EFFECT of this Regulation should be—1. That if two collections should be nearly the same in point of merit otherwise, that in which no previously exhibited specimen shall be found, will be regarded as the better of the two. 2. That in all cases of doubt the person who had not exhibited previously shall have the benefit of the doubt. 3. That when each of two competitors shall have introduced previously exhibited plants into his collection, that collection which contains the fewest of them shall be deemed the superior if they are otherwise nearly alike. It is not, however, wished that the previous exhibition of plants should depreciate their value so much as to place a superior collection below one very decidedly inferior. The APPLICATION of this regulation is left to your judicious consideration.

AWARD OF THE JUDGES.

LARGE GOLD MEDAL.

1 To Mr. Mylam, Gardener to Sigismund Rucker, Esq., jun., F.H.S., for a collection of Exotic Orchidaceæ.

GOLD KNIGHTIAN MEDAL.

1 To Mr. Robertson, Gardener to Mrs. Lawrence, F.H.S., for a collection of 30 Stove and Greenhouse Plants
2 To the same, for a collection of Exotic Orchidaceæ
3 To Mr. Redding, Gardener to Mrs. Marryatt, F.H.S., for 6 species of Exotic Orchidaceæ
4 To Mr. M. Henderson, Gardener to Sir Geo. Beaumont, Bart., for a miscellaneous collection of Fruit.

GOLD BANKSIAN MEDAL.

1 To Mr. Cock, F.H.S., of Chiswick, for 12 varieties of Pelargonium, in pots of 24 to the cast
2 To Mr. Gaines, of Battersea, for the same
3 To Mr. Dobson, for 12 varieties of Roses in pots
4 To Mr. Lane, for 25 varieties of Roses, in pots
5 To Messrs. Rollisson, of Tooting, for 6 species of Exotic Orchidaceæ
6 To Mr. Robertson, for 20 varieties of Cape Heaths
7 To Mr. Jackson, of Kingston, F.H.S., for the same
8 To Mr. Robertson, for Tall Cacti in flower
9 To Mr. I. Spencer, Gardener to the Marquess of Lansdowne, F.H.S., for a miscellaneous collection of Fruit.

SILVER GILT MEDAL.

1 To Mr. John Green, Gardener to Sir Edmund Antrobus, Bart., F.H.S., for a collection of 15 Stove and Greenhouse plants
2 To Mr. Robertson, for a collection of Stove and Greenhouse Climbers
3 To Mr. Dobson, Gardener to Mr. Beck, of Isleworth, for 12 varieties of Pelargonium, in pots of 24 to the cast
4 To Mr. Catleugh, of Hans-place, Chelsea, for the same
5 To Mr. Gaines, for 12 varieties of Pelargonium, in pots of 12 to the cast
6 To Mr. Parker, Gardener to J. H. Oughton, Esq., for the same
7 To Messrs. Paul and Son, of Cheshunt, for a collection of 25 varieties of Roses in pots
8 To Mr. P. N. Don, Gardener to G. F. Cox, Esq., of Stockwell, for 6 species of Exotic Orchidaceæ
9 To Messrs Veitch, of Exeter, for Oncidium Lanceanum
10 To Messrs Rollisson, of Tooting, for 20 varieties of Cape Heaths
11 To Mr. Falconer, Gardener to Archdale Palmer, Esq., of Cheam or Tall Cacti in flower
12 To Mr. Ingram, Royal Gardens, Windsor, for Veronica speciosa
13 To Messrs. Loddiges, of Hackney, for Epacris miniata
14 To Mr. M. Henderson, for Grapes
15 To Mr. Thompson, Gardener to Sir J. L. Goldsmid, F.H.S., for the same
16 To Mr. Dodds, Gardener to Col. Baker, of Salisbury, F.H.S., for Pine Apples.

LARGE SILVER MEDAL.

1 To Mr. Coysh, Gardener to R. Hudson, Esq., of Clapham Common, for 12 varieties of Pelargonium, in pots of 24 to the cast
2 To Mr. W. Cock, for 12 varieties of Pelargonium, in pots of 12 to the cast
3 To Mr. Catleugh, for the same
4 To Alexander Rowland, Esq., F.H.S., for a collection of 12 varieties of Roses in pots
5 To Messrs. Cobbett, of Chobham, near Bagshot, for 25 varieties of Roses in pots
6 To Mr. A. Milne, Gardener to C. S. Chauncey, Esq., F.H.S., for a collection of Roses in 50 varieties
7 To Mr. Rivers, F.H.S., for the same
8 To Mr. Green, for 6 varieties of Cape Heaths
9 To Mr. Dawson, of Brixton-hill, for the same
10 To Mr. Green, for Tall Cacti in flower
11 To Mr. G. Stanley, Gardener to H. Berens, Esq., F.H.S., for 6 varieties of Calceolaria, in pots of 12 to the cast
12 To Mr. Gaines, for 12 varieties of Fuchsia
13 To Mr. Falconer, for Brassia caudata
14 To Mr. S. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for Cattleya Mossiæ
15 To Mr. Glendinning, F.H.S., for Clerodendron infortunatum
16 To Mr. Dodds, Gardener to Sir George Warrender, Bart., F.H.S., for a miscellaneous collection of Fruit
17 To Mr. Frost, Gardener to the Lady Grenville, F.H.S., for Grapes
18 To Mr. E. Mitchell, of Kemp Town, near Brighton, for Grapes
19 To Mr. M. Henderson, for Pine Apples
20 To Mr. Wharton, Gardener to Miss Whitehead, of Weston, Bath, for the same.

SILVER KNIGHTIAN MEDAL.

1 To Mr. Bromley, Gardener to Miss Anderdon, of the Upper Mall, Hammersmith, for a collection of 12 varieties of Pelargonium, in pots of 12 to the cast
2 To Mr. T. Rivers, of Sawbridgeworth, F.H.S., for a collection of Roses in 12 varieties
3 To Mr. A. Milne, for the same
4 To Mr. Parsons, Gardener to A. George, Esq., of Enfield, for a collection of Roses in 50 varieties
5 To Messrs. Paul and Son, for the same
6 To Messrs. Lee, of Hammersmith, for the same *(a certificate of merit was given in addition, on account of good arrangement.)*
7 To Mr. Buttery, Gardener to F. R. Symons, Esq., of Norbiton Park, Surrey, for a collection of Roses, in 25 varieties
8 To Mr. Gaines, for 6 varieties of Calceolarias, in pots of 12 to the cast
9 To Messrs. Norman, of Woolwich, for a collection of 24 varieties of Pinks
10 To Mr. R. Laing, of Twickenham, for 12 varieties of Fuchsia
11 To Mr. Robertson, for Erica depressa
12 To the same, for Erythrina Crista Galli
13 To Messrs. Lucombe and Pince, of Exeter, for Cyrtoceras reflexum
14 To Messrs. Tyso and Son, Wallingford, Berks, for a large collection of Ranunculuses
15 To Mr. Brazier, Gardener to W. H. Story, Esq., F.H.S., for a collection of Seedling Heaths
16 To Messrs. Lucombe and Pince, for Ixora acuminata
17 To Mr. Glendinning, F.H.S., for Achimenes picta
18 To Mr. Smith, the Royal Botanic Gardens, Kew, for Pterodiscus speciosus
19 To Mr. Robertson, for the best-named collection (*one error in 30 plants*)
20 To Mr. Parsons, Gardener to A. George, Esq., of Enfield, for Grapes
21 To Mr. Davis, Gardener to Abel Smith, Esq., F.H.S., for Pine Apples
22 To Mr. M. Henderson, for Nectarines
23 To Mr. Fleming, Gardener to His Grace the Duke of Sutherland, F.H.S., for Peaches
24 To Mr. Foggo, Gardener to the Marquess of Abercorn, The Priory, Stanmore, for Peaches
25 To Mr. Terry, Gardener to Lady Puller, for three Melons (Anderson's Green-flesh).

THE SILVER BANKSIAN MEDAL.

1 To Mr. Bowen, Gardener to Sir E. Paget, Chelsea Hospital, for 6 varieties of Pelargonium, in pots of 8 to the cast
2 To Mr. Lane, of Great Berkhampstead, F.H.S., for a collection of Roses, in 12 varieties
3 To Mr. Slowe, Gardener to W. R. Baker, Esq., F.H.S., Bayford House, Herts, for a collection of Roses, in 50 varieties
4 To Mr. Lane, for the same
5 To Messrs. Cobbett, of Chobham, near Bagshot, for the same
6 To Mr. Dobson, for a collection of Roses, in 25 varieties
7 To Mr. Bennett, of Bath, for the same
8 To Mr. Francis, of Hertford, for the same
9 To Mr. Redding, for Tall Cacti in flower
10 To Mr. H. Ward, of Woolwich, for a collection of 24 varieties of Pinks
11 To Mr. Falconer, for Leschenaultia formosa
12 To Mr. Ayres, Gardener to J. Cook, Esq., F.H.S., for Pentas carnea
13 To Mr. Dobson, for Achimenes grandiflora
14 To Mr. Green, for a Grafted Azalea indica
15 To Mr. Catleugh, for a Pelargonium (The Wonder)
16 To Mr. Robertson, for Gloxinia maxima alba
17 To Mr. T. Jackson, for Dracophyllum secundum
18 To Mr. Green, for Aphelexis humilis
19 To Messrs. Rollisson, for the second best named collection (*no error in 20 plants*)
20 To Mr. Dodds, Gardener to Sir George Warrender, Bart., for Grapes
21 To Mr. John Wilmot, F.H.S., of Isleworth, for the same
22 To Mr. Fielder, Gardener to W. Linwood, Esq., F.H.S., for Pine Apples
23 To Mr. R. Fish, Gardener to Col. Sowerby, F.H.S., for Peaches
24 To Mr. Fleming, Gardener to His Grace the Duke of Sutherland, F.H.S., for Peaches and Nectarines
25 To Mr. Lidyard, of Batheaston, near Bath, for Strawberries
26 To Mr. W. Carmichael, Gardener to Mrs. Hawkins, of Bignor Park, Petworth, Sussex, for a Benares Melon.

THE CERTIFICATE OF MERIT.

1 To Messrs. Cobbett, for a collection of Roses, in 12 varieties
2 To Alex. Rowland, Esq., F.H.S., for a collection of Roses, in 50 varieties (*this would have have had a higher prize if the flowers had not been overblown*)
3 To Mr. S. Hooker, of Brenchley, for the same
4 To Mr. Laing, of Twickenham, for the same
5 To Mr. Stanley, Gardener to H. Berens, Esq., F.H.S., for a collection of Roses, in 25 varieties
6 To Messrs. Mountjoy and Son, of Ealing, for Lilium testaceum
7 To Mr. Robertson, for Erica ventricosa alba
8 To the same, for Gesnera lateritia
9 To Mr. Green, for Chorozema ovatum
10 To the same, for Coleonema rubrum
11 To Mr. T. Jackson, F.H.S., for a collection of Gloxinias
12 To the same, for Viscaria oculata
13 To Mr. Beck, of Isleworth, for a seedling Pelargonium (Desdemona)
14 To Mr. Hoyle, of Guernsey, for a seedling Pelargonium (Titus)
15 To Mr. Whomes, Gardener to E. Foster, Esq., of Clewer, near Windsor, for a seedling Pelargonium (Exactum)
16 To the same, for a seedling Pelargonium (Sir John Broughton)
17 To Mr. Mylam, for the third best named collection (*four errors in 27 plants, and remarkably well written*)
18 To Mr. Malpas, Gardener to Mrs. Ormsby Gore, for a Providence Pine Apple
19 To Messrs. Lee, of Hammersmith, for the skill with which their Roses were arranged.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS, ANTONY GIBBS AND SONS, LONDON; WM. J. MYERS AND CO., LIVERPOOL;
And by their Agents,
COTESWORTH, POWELL, AND PRYOR, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.
47, Lime-street, June 14, 1844.

TURNIP SEASON.

GUANO (Foreign and Potter's), RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of MARK FOTHERGILL, 40, Upper Thames-street.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. MR. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT WATER

J. WEEKS and Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This Cooking Apparatus is believed to possess greater general advantages than any yet submitted to the Public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the Apparatus; and B. & H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. A Prospectus can be forwarded, upon application, detailing particulars and prices, to 130, Fleet-street.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, &c.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Bunney to submit to public competition, by Auction, on the premises, Kingsland Nursery, on Tuesday, July 9, 1844, and following day, at 11 o'clock (in consequence of the Lease having expired), the whole of the rare Exotics, and other plants in pots; consisting of fine specimens, Araucarias, Bonapartea, Juncea, Clivea Nobilis, Cactus, Gloxinias, Achimenæas, Magnolias of sorts, New Fuchsias, Gardenias; about 1500 Double and Single Camellias; several thousand China Arbor Vitæ, Sweet Bays, Arbutus, Cypress, &c., in pots; also eight Greenhouses, Pits, &c., in good condition; a considerable quantity of Bricks, York Paving, and other fixtures. May be viewed prior to the sale, and catalogues may be had of the principal Seedsmen, on the premises, and of the Auctioneers, Leytonstone.

The whole of the valuable Nursery Stock will be submitted to public competition, by Auction, about the third week in October.

BY ORDER OF HER MAJESTY'S COMMISSIONERS OF WOODS AND FORESTS.

MAESTRICHT GARDEN, WINDSOR HOME PARK, BERKS.

To Builders, Nurserymen, Market Gardeners, and Others.

TO BE SOLD BY AUCTION, by Mr. TEBBOTT, upon the Premises, near Datchet-lane, on Wednesday, July 3rd, 1844, at 12 o'clock, in Lots to be taken down at the Purchaser's expense, comprising a large quantity of MATERIALS to sheds, fruit-houses, and stables, several rods of brickwork in walls and pits, two superior greenhouses with stages complete, 30 feet and 45 feet long; two others, 15 feet and 13 feet long; skeleton frame for a tulip-bed, 50 feet long; twenty-eight 3 light boxes, glazed, curbs and lights for melon-pits, copper pipes, &c. &c.—To be viewed two days prior to the Sale. Catalogues to be had on the Premises; Crown Inn, Slough; White Hart, Maidenhead; Chequers, Uxbridge; Clarence Hotel, Staines; and at the Auctioneer's Office, Windsor.

NURSERY.

TO BE LET, a Nursery, containing about 2 acres in a most desirable situation, in the centre of the West Riding of Yorkshire, in a good state of cultivation, with a Pinery, Greenhouse, Vinery well stocked, and in excellent state of bearing, and newly-erected Hot-water Propagating House, 90 feet long, 10 feet wide, with sheds, &c. Valuation moderate. Also 2 acres of Grass Land adjoining the Nursery.—For particulars apply to Mr. R. BARRATT, Solicitor, Wakefield.

Wakefield, June 20, 1844.

WANTED, at Michaelmas next, for 7, 14, 21, or a longer number of years, a FARM-COTTAGE, and 300 or 400 acres of GOOD LAND (more but not less will be taken), in any of the following counties:—Devon, Wilts, Somersetshire, Cornwall, Kent, Surrey, Middlesex. No conditions agreed to but to farm in the best style, pay for the incoming crops, and reference to assure the rental being paid half-yearly.—Address O. G., Office of this Paper.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.—The Third Meeting will take place on Saturday, the 13th of July; on which occasion His Grace the Duke of Devonshire, the President of the Society, has kindly directed the doors of his Gardens and Pleasure-Grounds to be opened for the reception of all persons who shall have been admitted into the Garden of the Society by Tickets.—21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, JUNE 22, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

TUESDAY, July 2 { Royal Botanic Gardens. . 2 P.M. / Horticultural . . . 3 P.M.

COUNTRY SHOW.—WEDNESDAY, June 26 . Woolwich Floral.

THIS time the sun of summer shone on the MEETING OF THE HORTICULTURAL SOCIETY in their garden at Chiswick, and the 15th of June proved as propitious as the gayest crowd could have desired. The exhibitors had the honour of submitting their productions to the inspection of His Majesty the King of Saxony, who with their Royal Highnesses Prince Albert, the Duchess of Gloucester, and the Duke of Cambridge, spent about an hour and a half in the tents. His Majesty and the Prince were graciously pleased to express their gratification at seeing so many beautiful objects collected together. After the departure of the Royal visitors thirteen thousand five hundred and seventeen persons entered the gardens.

The full report of the Exhibition, which will be found in another column, renders it unnecessary for us to dwell upon it here. As usual, it combined all that the wealth and skill of this great country could produce.

The next and last meeting for the season will take place on the 13th of July, on which occasion His Grace the Duke of Devonshire has again most kindly expressed his intention of opening his beautiful grounds to the visitors to the Society's garden. The scene at Chiswick House, on the similar occasion last year, was one of the most lovely it was ever our good fortune to behold.

THE many letters which have reached us on the subject of VILLAGE HORTICULTURAL SOCIETIES, since we offered some remarks on the plan of management observed at Pytchley (see p. 243, 1844) have convinced us that we in no degree over-estimated their importance. It is undeniable that they exercise the best effect upon the rural population, and contribute more than any other thing, unless it is a good allotment system, to improve substantially the condition of the labouring poor.

Considering the actual state of the Agricultural population, it is hopeless to expect a favourable change from any sudden and great measure of government. That improvement which is so sadly needed must be effected by the well-directed acts of sensible men in all parts of the kingdom, each doing his share of the good work in his own immediate neighbourhood. As a correspondent, thoroughly acquainted with the working of village Associations, has well observed, "So long as people hunted for riches by attempts at the Philosopher's Stone, England was poor. But when wealth was sought by small accumulations of minute profits, then began the increase of England's mighty Capital Stock. In like manner the comfort and elevation of our population must be aimed at through the aggregation of minute things (like the successive spadesful of earth in a railway embankment), if we would do anything of real importance in raising that population. The English character is a noble one, if we draw out its better parts, and give it honest independence, and repress and discourage its bad parts. You may *trust* to an Englishman, rich or poor, if you find the avenue to his esteem and respect and confidence, and *if he is satisfied there is no humbug about the matter!*"

This last is a most important proviso, and explains, we are sure, in almost all cases, the failure of attempts to maintain advantageously village Horticultural Societies. Humbug is not indeed a refined expression, but it is one of very extensive application, and particularly suits the proceedings of ill-conducted rural Shows. A very few illustrations will put this in its true light.

Fairness in judging is the first element of success. People are contented with awards, although unfavourable to them, if they are certain that the judges are perfectly conscientious in their decisions. But if men are not satisfied upon this point, good bye to all chance of holding them together. The poor are too much exposed to trickery elsewhere, to court it by belonging to Associations in which the judgments are unfair. And yet, such conversations as the following have been heard:—"Oh it will never do to give the first prize to Mr. ——, for Lady —— expects it." Or, "Why A., you had the first prize for *this* last time—it's my turn this time." Judges tell these things sometimes when a little quarrel has let secrets out. What is this but humbug? The poor will naturally conclude that if there is such unfairness in one part of the arrangements, there will be the same in others.

Prizes are offered for various Horticultural productions. Competitors appear; their productions are excellent, according to their means; but owing to a want of classification the most unequal and unfair comparisons are drawn. Joe Bramble has some excellent Lettuces for a cottager, but the season has been cold and dry. Mr. Cheeseman, the grocer, also has Lettuces; but then he has a handglass to put over them. Both show, and poor Joe, who has no handglass, is beaten. What is that but humbug; to pretend to give prizes fairly, when, from the want of classification among the exhibitors, the result is certain beforehand? Perhaps this does not often happen, but it does sometimes. The thing, however, is common enough in another shape.

In small provincial Societies, the tradesmen who love flowers, have often not a chance. Their productions are exceedingly good, but they may go to the Show time after time in vain. And why? Because the head-gardener of the Squire, with hothouses, greenhouses, and frames at command, regularly sweeps *every* prize away. In such cases the judges will not be to blame, for of course the flowers of the great man of the village, and of the shopkeeper, will not bear comparison. But the effect of such rules, or want of rules, is most disastrous. The tradesman with a taste for flowers, with Carnations, Dahlias, Cacti, Pansies, &c. of sterling excellence, if compared with ordinary gardens of thousands of country gentlemen, is chagrined at the result, withdraws from the Society, and is soured against his wealthy neighbour.

It may be very true that when rural Societies are broken up, these causes are not assigned. It is not every one who chooses to confess that his discontent arises from awards the injustice or hardship of which he cannot prove. Honest pride forbids it. But every one conversant with this subject knows very well that such things are usually at the bottom of the matter.

We would, therefore, advise the managers of rural Societies to be strictly on their guard against errors of this sort; and, whatever their regulations otherwise may be, to take care that the following are part of them:—

1. No exhibitor to be a judge. The judge to be obtained, if practicable—and it is almost always practicable—from a distance. That will insure the award against the charge of partiality.

2. No person to be regarded as a cottager who gets his living otherwise than by daily labour.

3. Productions obtained wholly in the open ground, or under glass without fire or dung-heat, or in pits or houses artificially heated, to be exhibited and judged independently of each other.

4. Persons having no regular gardener not to exhibit in the same class as those who have one or more regular gardeners.

We cannot but think that some such plan as this, which, indeed, has been more or less adopted in the most successful village Associations, would greatly tend to hold people together, and render discontent impossible.

REMARKS ON POTATOES.

THE frequent failure of the Potato-crop of late, has very justly alarmed cultivators of this valuable root, anything affecting which, may be justly called a national affair. However, in puzzling extremities we are apt to search for far-fetched causes, when, perhaps, they are few, simple, and close to our elbow.

A correspondent (p. 344 of the current year), has made some very useful remarks on the subject, in several of which I heartily concur, but must be allowed to disagree with him as to planting Potatoes in the autumn. Everybody knows that self-set Potatoes spring up very strong, as compared with seed introduced, especially bad seed. Yet those only sprout which are placed just out of the reach of the amount of frost which may have occurred during the past winter. However, to plant at the depth necessary to insure safety through the average of winters, would only be adapted for very light uplands; for wet and sour soils would become completely "puttied" before the plant could be in full action. The chief causes of failure are:—

1st. Badly prepared ground for the seed.
2nd. Using raw and clotted manures.
3rd. Planting seed which has been sprouted.
4th. Pitting seed in too large quantities in an imperfectly ripened state.

With regard to the 1st, I would remark that, although highly pulverised garden ground seldom produces good Potatoes, yet how seldom does the Potato miss coming in such soils, compared with ill-wrought farming lands!

Great breadths are set in fields on what is termed a single furrow, and which has been grazed over until the beginning of April—at least in this neighbourhood. It is then, after being ploughed, or I should say skimmed, left to dry for three weeks, with the turf laying excessively porous; and the weather being generally dry at that period, it frequently becomes baked into bricks, in the course of which the decomposition of the sod is completely arrested; and, to crown all, the beds, or "butts," as they are called here, are soiled over the moment the plant appears, with clods as harsh, and as unfit for nourishing the tender plant, as the soil they are planted in.

2nd. *Using raw and clotted manures.*—Turning and blending manures seems to have got out of practice in some parts; the greater part of the manure applied to Potatoes in some districts with which I am acquainted, is taken in a raw state from the farmyard—much of it recently made, and laying in hard, raw, and undigested masses. This is peculiarly the case with cow manure. Now, if this was removed from the farmyard to the head-lands of the fields intended for Potatoes, some months previous to using, and, if possible, slightly fermented there, then before the second and last turning the heap were covered slightly with some fine bone-dust or guano, how much more powerful as well as equable in moisture would the compost become! The only thing that hinders some such practice, is the necessity for more labour; but surely well-directed labour will amply repay in the end.

3rd. *Planting seed which has been sprouted or disbudded.*—It is well known that each succeeding series of buds consequent on disbudding, is weaker than its predecessor, and that, if done three or four times, the leaf-buds become finally destroyed. Who, then, can wonder at the great loss to the crop, through the destruction of even the first sprout? However, it is not the loss of the sprout alone, but with it is gone a quantity of food, intended by Nature to nourish the buds in the act of germination, or until they can cater for themselves. Besides, it is pretty well understood that the upper end of the Potato brings the heaviest produce. Now this end, of course, in the majority of cases, buds first, and the consequence is, that instead of two or three strong original stems, we have, in the case of disbudding, a host of shoots of secondary power, from the lower parts of the Potato; the result of which is, that instead of a given quantity of good produce fit for market, there will, inevitably, be an inferior quantity, much of which will be small in size, or what growers term "chats."

Lastly. *Pitting seed in too large quantities in an imperfectly ripened state.*—I am not of opinion that the size of the pits has increased so much of late years as to account, as some have imagined, for the failures which have taken place. But of this I am assured, that late planting has become prevalent, the consequence of which has been badly-ripened seed. Now, I imagine that such late and unripe seed undergoes a much stronger fermentation in the pits. Besides, late planting has led to the necessity of late taking up, and it is no uncommon thing in this quarter for the crop to be somewhat frost-bitten when pitted, as the operation is frequently deferred until the second week in November. Frost-bitten Potatoes will decay prematurely, and their decay, in conjunction with the high fermentation above alluded to, becomes a fruitful source of failure to future crops. The only wonder is that such should grow at all; but the vital powers of the Potato are amazing.

To the above evils may be added another serious affair, viz., planting in periods of drought. After all the former abuses, the unfortunate set has to be perhaps imbedded in hot dust, as acres have been this season. Now, why not follow the plough or the spade? Roots or seeds will always come best on newly dug or ploughed land, providing it is in right tilth.

All Potatoes intended for seed for the ensuing year should be selected when the stock is taken up, and stored away separately; and if they must be pitted for convenience sake, by all means let them be hardened by exposure to the air (not sun) for several days previous. What is called "greening" them is, I think, carrying the process too far, especially in the case of early kinds, as it excites the bud into premature growth, especially if rainy weather ensues. I have frequently known them to bud on the ground in the greening process. Very early kinds should, if pitted, be taken out by the early part of January, and placed thinly on shelves or floors, covering with straw or otherwise during severe frost. The best place for budding early ash-leaved kidneys, as far as my experience has gone, is the fruit-room shelves. In this case the fruit-room, it must be understood, is about three feet below the ground-level, and perhaps slightly damp.

Much has been said about planting Potatoes whole. Whole planting has these advantages:—1st, a greater certainty in the crop coming up; 2nd, a superior produce, if they have sufficient distance and the soil is pretty good, together with high cultivation and broad-shouldered drills. Its chief disadvantages are overgrown Potatoes, sometimes too large to be saleable, and inferior in quality; the latter arises from the circumstance of their producing more and stronger haulm than cut sets, consequently the elaboration of sap is less complete. I speak now of planting whole Potatoes; but a much better plan is to plant the moderate-sized ones (as recommended by "J. McI.," p. 344). One of the best crops of the ash-leaved kidneys I ever knew was from very small whole seed, which had been slightly greened, but not budded previous to planting. The most general fault of Potatoes planted whole is the not allowing sufficient room between the drills. On land in a high state of cultivation the drills should be about three feet six inches apart, and the row of Potatoes, when finally earthed, should present the appearance of an asparagus bed, having broad shoulders of at least eighteen inches, the surface of which should have an inclination towards the Potatoes, thereby conducting the rain to the plant, which, in the ridiculous pointed drill now in use, is immediately conveyed from the plant. By this mode of cultivation I once grew twelve bushels on a single rood of ground, which rood in Cheshire is eight yards square.

With regard to putting the manure under or above the

acts, there exists much contention. I recommend having it well rotted, and mixed thoroughly with the soil. I may add, in conclusion, that one great advantage in planting whole Potatoes is the facility which the wide drills afford for the operations of cleansing thoroughly, and also for picking off the blossom,—an operation that should never by any means be omitted.—*Robert Errington.*

FAMILIAR BOTANY.

MORPHOLOGY.—No. XV.

Who can recount what transformations there
Are ceaseless made? What hidden forces strive?
And how fresh changing leaves with leaves combine,
Form the dark chambers of the nascent germ,
And guard with pointed leaves the unborn embryo's home.

WHEN people listen with incredulous ears to the assurance that a Peach is formed out of a leaf, they do not consider what sort of body the Peach was when young. It would not appear so extraordinary that an Apple should be composed of leaves, if the nature of the Apple were ascertained before it began to grow into that sort of fruit. There is no more resemblance between the young Peach or the young Apple and the full-grown fruit, than there is between the latter and the leaves. It is not surprising that small things should be overlooked by those who wo'n't use magnifying glasses. He who would see more than his neighbours must arm himself with spectacles.

The young fruit of a plant is called its CARPEL. That is what we must look to, if we would judge of the true nature of the fruit. To take another course is like attempting to determine the quality of timber after it is covered with paint and varnish. In examining the carpel a better subject cannot be taken than the common Cherry.

The carpel of the Cherry consists of a shining oval bright-green case, called the *ovary*, within which is a *young seed* or *ovule*; at its end is a thread called the *style*, the termination of which is a moist expansion termed the *stigma*. On one side of this stigma is a notch, and from that notch, down to the bottom of the ovary a deep furrow passes. But although this is the usual state of the Cherry-carpel it is not always so. Sometimes, especially in double Cherries, the furrow is an opening on one side of the carpel, from top to bottom; and then the sides of the carpel are veined, while the edges of the opening are toothed, and the whole texture of the thing is that of a leaf. In fact it is a small leaf, folded up, with its end extended into a style, and its point enlarged into a stigma; the only difference is that it sometimes carries an ovule on one of its edges; but it sometimes does not. The carpel of a Cherry, then, is a rolled up leaf. Sometimes the Cherry will produce two such leaves, one opposite the other, and sometimes it will in like manner produce two carpels: in both instances the parts of those organs bear precisely the same relation to each other.

The carpels of the Whitethorn are two or three, or even five, placed in a ring, at the bottom of the calyx, and having a little spongy pyramid rising up between them. Each of these carpels is like that of the Whitethorn except that it is hairy; and a very moderate search will produce instances where, as in the Cherry, the carpels are represented by little leaves; in the double Whitethorn this is very common. It is just the same in a Rose, except that the number of carpels is very considerable. Each of them is like that of the Whitethorn, and each is very constantly opened on the furrowed side, and spread into a small leaf. The furrow is, in fact, the line where the edges of the folded leaf come in contact.

The Ranunculus, the Anemone, and the Potentilla, present endless evidence of the same sort. In a damp season it is more abundant than in a dry one. There are now before us specimens of a Potentilla nepalensis in which the carpels are, some of them, in their most ordinary condition, some a little opened on the furrowed side, some broad and nearly flat, while many are enlarged and lobed, and veined, and just like common leaves. No doubt, then, can be entertained that the carpel is a small leaf folded up.

But I have more illustrations of this at hand. In a letter by Mr. Ayres, lately published, mention is made of a very singular deviation from ordinary structure in an Epacris nivalis. The subjoined cut represents this case. The Epacris has, in its usual state, 5 carpels, which are soldered together where they touch. But in Mr. Ayres's specimens some of them are merely unsoldered, some are thinned and opened into little leaves, while others are so entirely like leaves that you cannot distinguish them, and, in certain instances, they actually stand on the surface of a branch which has lengthened from between them, in a manner that will be explained hereafter. Here these carpels and leaves are proved to be the same thing in different states.

The last piece of evidence for which I can find room is the following, for which I am indebted to a friend, in Ely.

Fig. 1 represents the carpel of a common Columbine, artificially opened along the furrow, but otherwise in the

ordinary condition. But my correspondent found a plant of this species with its carpels in all sorts of changes, even into that of lobed leaves. In fig. 2 we have a carpel with five lobes on its sides; in figs. 3 and 4 it is spread quite flat and lobed along almost the whole of the edge, from end to end. At the same time, the ovules, which at fig. 1 stand in rows upon each edge of the opened furrow, have wholly disappeared. To this curious case I shall again refer for another purpose.

I now conceive that the carpels of the Cherry, the Hawthorn, the Rose, the Epacris, and the Columbine, have been sufficiently shown to be leaves, and therefore all carpels must be so considered; for what is physiologically true of a given organ in one plant, is true of the same organ in all other plants, as has been already stated.—*R. E.*

THE RANUNCULUS.

So much has been written on the culture of the Ranunculus, that the young florist has ample means of knowing how to manage this lovely flower with the fairest hopes of success; but I apprehend that a few remarks on the habits of this class of plants may not be unacceptable to your readers. From the experience of 40 years, I am prepared to say that the Ranunculus delights in a moist soil and a rainy season. Last year was the most congenial to this class of plants I ever recollect of. Indeed so prosperous was it, that many of the old varieties, such as Naxara, Variat, La Tendresse, Brelange des Beautés, and several others, sent up fine pericarps, commonly called eyes, from which, by impregnation, good seed has been saved. The frequent showers of 1843 induced most of the best seedlings which have for some years maintained a high character as good show-flowers to yield large seed-vessels, so that many of the flowers were unfit for exhibition; but for this trick of youth, they have amply compensated by producing a greater abundance of prime seed. The showing of the eye may be thought by many a great drawback on the value of a flower; yet it should be remembered that no flower shows such a perfect crown as one whose petals are supported by the seed-vessel; though it is well known that they will not do for exhibition after the pericarp is developed. But it is also certain that those that are semidouble will come perfectly double in a few years; and many that produce large seed-vessels in a congenial season, will, in a dry spring, be entirely destitute of them, but generally inferior both in size and colour.

There is also in the Ranunculus what is by florists called a sportive character—that is, they run from their original colour; though this defect is not so glaring as in the Tulip and Carnation, yet it causes great disappointment to the ardent florist. Some that have yellow grounds delicately spotted will come plain yellow, and some red and white striped will come plain red; sometimes the colours will mix, and the flowers will become dingy. I have a beautiful modest flower which some years ago obtained a first seedling prize; I called it "Innocent;" but the year before last it came so foul, that I wrote against it "Guilty." Last year, however, it resumed all the beauty and purity of its youth, which induced me to write against it "Acquitted." Cathcart, when it first bloomed, was a white ground, beautifully mottled with crimson; now it frequently comes with only a crimson spot; but in good seasons it will display all the beauties of its youth. Sometimes the flowers will be as green as the grass of the plants from which they grow. Some of the finest seedlings are weak, and therefore die in a few years; though for a short time they had great renown; such has been the case with Abbé St. Andrew, Quixos, Viol le vrai Noir, Grand Berger, and Rose Incomparable, and some others of later date. But there are others of first-rate character which are remarkably strong, and increase abundantly, such as Attractor, Felix, Saladin, Edgar, Eureka, Victor, and many others. If the last season was very propitious for the Ranunculus, the present 1844 has been altogether as adverse, especially for the early-planted roots. The frosts by night, and the drought by day, have done much injury, and many have died. These are circumstances which try the patience and baffle the skill of the ardent florist; but let him persevere through all the diversity of seasons, and his efforts will be sure to be crowned with success. I have during the last twenty years raised many thousands of seedlings, out of which I have selected about two hundred; amongst them is one yellow-edged seedling called Edgar, which is so perfect in every respect, that the London florists pronounced it "a model flower," and many others of them have at exhibitions borne away the palm from their far-famed predecessors. I generally grow from 20 to 30 large beds, planted at various seasons; but the best time to secure a good bloom is to plant in the last week in February or the first in March.—*Joseph Tyso, Wallingford.*

Home Correspondence.

Rose Budding.—I strongly recommend all amateurs who are desirous of avoiding disappointment in budding Roses, to leave a small piece of wood as a protection to the bud when cut from the branch. By adopting this plan, I have succeeded in propagating all descriptions of Roses, even in the driest weather, both late and early in the season. I always use white worsted, instead of bast, for tying up, which I find answers much better; it keeps the parts more closely together, and they unite in a shorter time. A very small portion of wood is sufficient to preserve the root of the buds. My stock, on which I operate, is the Bengalensis, free and rapid in its growth. The crimson Boursault also makes a good parent, and is easily struck.—*Falcon.*

Sowing Seed.—I have had no difficulty in bringing up my seeds, during this unusually dry weather, by pursuing the following system:—Dig and pulverise the earth well, soak it with water (not immediately from a spring,—it should be exposed for some time to the air), fine the top, sow the seed in shallow trenches, which is far preferable to broad-cast, and then sift over the bed a coating of rich compost; in a few days the appearance of green leaves will reward your trouble. In this way I coax Parsley above the ground in three weeks.—*Falcon.*

Statice pseudo-armeria.—Having been a considerable time familiar with the Armeria latifolia, a notice of which as a new plant is quoted, in your Number of June 1st, from "Paxton's Magazine," under the name of Statice pseudo-armeria, and having received some account of its history from Dr. Bell Salter, of Ryde, I take the liberty of offering some remarks respecting it. Some seeds of a supposed new Statice were given by Ashurst Majendie, Esq., of Hedingham Castle, Essex, and Caen, in Normandy, to several persons in Ryde in the winter of 1842, and John Vaux, Esq., (my former esteemed employer) succeeded in flowering it last year, but most of the plants produced did not flower until this year. As soon as it flowered it was at once recognised as the Armeria latifolia, of which a sufficient description and a characteristic cut are given in "Loudon's Encyclopedia of Plants," and its introduction is dated as far back as 1740. It is here mentioned as a native of "Algarbia." Mr. Majendie received his seeds from a French officer serving at Bona, in Africa, of which place and district it is a native. I have not "Paxton's Magazine" to refer to, but I see by your extract that it was received in 1841 by Messrs. Rollisson, from the Jardin des Plantes, but unaccompanied with any memoranda of its history; this deficiency, I believe, I can fortunately supply. Mr. Majendie presented seeds to the Jardin des Plantes a very considerable time previously to his doing so here; the plants from that quarter are, therefore, no doubt of the same origin as those growing in this island—namely, from Bona; and Mr. Majendie has lately mentioned in Ryde that in France they have given to his plants the name by which Mr. Paxton mentions that he received them. Some of the Ryde plants were given last year to Sir Wm. Hooker for the Kew Garden; he confirmed its being the Armeria latifolia, and considered the present to be a re-introduction, supposing it had been lost to this country. Of this, however, I have reason to entertain very strong doubts, there being now in the garden under my care (namely, that of J. Percival, Esq., of Woodlands, near Ryde), a plant which has been there a considerable period. I have every reason to believe that it was obtained in London at far too early a period to be of Mr. Majendie's source, and therefore have no doubt of its being from the old stock of the original introduction. In conclusion, I can bear ample testimony of the beauty and desirableness of the plant, and am happy to be able to confirm Mr. Paxton's suggestion as to its admitting early forcing, and also to be able to add, both on the authority of Mr. Majendie and from my own observation, that it will bear the winter in this country with-

out any protection. A plant, now thriving well in the open garden, has remained there without protection two winters, and from the inquiries I have made I should think it had been three, or even four.—*E. Barmall, Woodlands, near Ryde.*

Chinese Seeds.—It may amuse some of your readers to hear of the following example of Chinese bad faith. An old botanical pupil of mine, with every facility for procuring what he might want in China (being in the suite of Sir H. Pottinger), lately sent me over 79 little jars of Chinese seeds, duly labelled in unintelligible hieroglyphics, but accompanied with a list professing to give the botanical names of many, and a slight description of the rest. These seeds were positively declared to be genuine, and the collector most trustworthy. Upon examination they were found to contain only 14 sorts in all, not less than 11 different names being given to the very same seed in one case—the names belonging to as many different families. I have more than once received seeds from China in these little jars, but scarcely any of them ever germinated, and I believe it is a custom with the Chinese to scald the seeds they sell to barbarians!—*J. S. Henslow.* [We fear the plant-sellers of the Celestial empire are not Sinenses but Sinonides, for they certainly must claim their descent from the prince of cheats.]

The Vine.—Writers on the cultivation of the Vine under glass, insist much on the necessity of keeping a dry atmosphere while the Grapes are ripening. Now, at Cabul and Candahar, where the Grapes ripen out of doors, and are said to be the finest in the world, the dew is, I should imagine, much heavier than with us, so that at night both leaves and fruit must be covered with moisture. Should we not, therefore, imitate Nature more closely, and keep the leaves of our Vines in a healthier state? obtaining thereby fruit of a finer flavour, if we were to keep a moist atmosphere at night till our Grapes are quite ripe.—*Guichenet.*

Bees.—My object in forwarding my remarks on bees to the *Gardeners' Chronicle*, was with the view of drawing the attention of more experienced apiarians to peculiarities I fancied I had observed in the habits of these industrious insects, which might have escaped their notice; and I certainly expected, from the respectability of the publication to which they were addressed, that in the event of obtaining a place in its columns, the Editor would have avoided inserting remarks in subsequent Numbers tending to ridicule my communications. In a newspaper desirous of promoting a spirit of inquiry, the greatest care should be taken not to check, but rather to encourage, disinterested correspondents, who, if they are wrong in their impressions, have no object in view but to call forth the conscientious opinions of others, and not such evidently intended ridiculous assertions as your correspondents "Mel," and his amiable consort "Melissa," have given in their allusions to "bees and their nightcaps." Perhaps your correspondent with the wonderful Wrotham telescope will favour your readers with a solution of the reason a butterfly or a housefly, and many other sharp-sighted insects, can be touched by the hand on some occasions, when at other periods the slightest movement or approximation would cause them to fly away. I have witnessed, and many medical men can confirm the truth of my statement, that there are members of the human race who habitually sleep with their eyes open, and, I may add, without nightcaps; and the hand or a lighted candle has been moved backwards and forwards, close to the face, without the eyelids or the pupil contracting in the least, or the sleeper being aware of the presence of other parties. It is, therefore, surely not too great a stretch of the imagination to suppose that the eyes of bees, in their dark abodes, may be sufficiently obscured to enable them to enjoy, what it is probable all animated creation requires, the luxury of repose. It is surprising that your correspondent did not allude to the continual hum in the interior of a hive in summer, as likely to disturb the sleep of the bees, even although aided by the nightcaps he says he has discovered; but it is more than probable he has been a great traveller by sea and land, and has ascertained from personal observation that the wearied sailor can sleep amidst the lashing of the waves and howling of the winds on the tempestuous ocean; or he may have visited the interior of one of the cotton mills along with Lord Ashley, and observed the overworked factory child, without the aid of a Wrotham nightcap, as sound asleep and oblivious to all external objects, amidst the continual noise of the steam-engine and loud hum of the spinning-jennies, as in the dark room and humble bed allotted for repose when the labours of the day are ended. Your correspondent's attempted sneer because I have designated some of the bees guards, in consequence of the duties they appear to perform, I shall only answer by quoting the following from Bonner, whose work, published in 1795, gives an interesting and shrewd account of the natural history and habits of these insects; and, if he uses the terms "scouts" and "squadron" in illustrating his observations, I cannot perceive any inappropriateness in applying the term I have used to explain the idea I wished to convey of the regularity and evident systematic arrangement so beautifully exhibited in all the actions of a hive of bees:—"When the weather is very favourable, the bees often, before swarming, send out scouts in search of a proper habitation; and when they discover a hive whose bees are dead, or any empty place about the roof of a gentleman's house, or a church, castle, or trunk of a tree, more especially if bees have wrought combs in it the summer before, but have died out of it in winter, they will send out a squadron of bees, three or four days before they swarm, to clean out the place, and render it fit for the reception of the young colony the first favourable opportunity."—*John Grant, Woolwich.* [We can assure our correspondent that neither *Mel* nor *Melissa* had a thought of hurting his feelings. We did not dream that offence would be taken at a little harmless banter. "Oderunt hilarem tristes tristemque jocosi," says Horace or somebody else; we fear the saying is too true; and yet we cannot be serious always.]

Bees.—In the year 1842, a stock of bees settled in a box formed according to Mr. Cotton's plan, and filled a side-box; I had 25lbs. of beautiful honey from them. Last year I had a large swarm from this stock, which I imagined weakened them too much, as the season was so unfavourable they only collected honey for themselves. I had purchased a swarm in the parish, but it could only have been a cast, it was so small; consequently only 3 or 4 small combs were made and filled. Knowing there was every probability of one, if not both, of these stocks perishing in the winter, I resolved to unite, and then by way of experiment bury them. I had some thick syrup made, and turned up the hives, sprinkling a very little upon the bees in each, and placing the old hive upon the other, in hopes the smallest lot would creep up; but no such thing occurred. The next morning they had descended to the cast, and there they pertinaciously remained, despite of my turning them about, first up, and then down. It seemed certain death to bury them with so small a portion of food; therefore I was compelled to put in both hives together, and make them up in the form of a Potato pit, having a roof of two thatched hurdles put over to keep the rain off. On the 25th of March, my prisoners were disinterred, and I must confess I was very much delighted to hear a brisk hum. About half a teacupful of dead bees were taken out, and very little honey had been consumed; the bees seemed settled in the upper box, and as the sun shone brightly they were quite overjoyed at their liberty. Alas! the unnatural swarm I had from them the spring before, finding these were so much better off than themselves, (though they had not eaten all their stock of provision) began robbing and murdering with savage ferocity. I shut up the attacked for a day or two, and fed the marauders. All went on quietly for a month, when they made another attack; the gardener covered them with a mat, and though many were killed, still they went on thrivingly for a few weeks; then a third attack was made, and before they obtained help more were killed than before. To give my persecuted stock a chance of life, it was moved into a walled garden, some little distance off, where I flattered myself it would remain undiscovered; but no such good luck was for it. On Monday last, the wretches came in double force very early in the morning, and I do not think a handful survives of this unfortunate family. What can I do? The robbers thrive on their ill-gotten gains; I have finished and sealed the combs in the centre box, and filled three parts of a side-box, and now I have put on another, thinking there must be "idle hands" which have perpetrated so much mischief. What can their learned advocates say of such bad dispositions in their favourites? And are there any means, short of fire and smoke, by which to reduce my rebels to order? What have I done wrong or clumsily? And what should I have done, in order to the better success of my experiments?—*An Old Correspondent.*

The Sting of a Bee.—Turning to p. 509, vol. ii., of the *Chronicle*, my eye caught "Sting of a Bee." The remedy there given is a very inefficient one; laudanum will not cure, but liquor potassæ will, perfectly and immediately; it instantly removes the pain, and prevents swelling or inflammation: the poison of the bee being an acid, this very powerful alkali neutralises it. It should be applied cautiously, of course; a sharp pen, or very fine camel's-hair pencil, or even the point of a needle does well; but it must be applied instantly upon the sting being extracted. As I am constantly amongst bees, I generally carry a little bottle containing a few drops in my pocket. It is very rarely that I get a sting, but when I do, my remedy is at hand. I regard it not half so much as the sting of a Nettle.—*A Constant Reader.*

Humphreys's Compound.—Observing in an advertisement in your columns, that what is called a liquid guano may be made by means of Humphreys's Compound, dissolved in water, and having been informed that this compound is little else than nitrate of soda and common salt, I could not at all understand how anything resembling guano could be made from it. Under this impression, I got a chemical friend to examine this compound upon the chemical ingredients of guano, and he informs me that he cannot discover a trace of phosphate of lime in it, which every one knows is the principal fertilising substance of guano! I do think that parties advertising manures ought to be more particular in their assertions, and not take it for granted that all who read their announcements are blockheads.—*F. R., St. George's-place, Brixton.* [We cannot be answerable for the statements of advertisers].

Euphorbia Jacquiniflora.—The following is the result of an experiment with this plant:—I bought a large specimen, but to my disappointment it was covered with brown scale. Determined, however, to clean it, I cut every branch back to the old wood, and smeared it over with clay, according to Mr. Beaton's plan, made to the consistence of thick paint. I shook all the soil away from the roots in order to get at the bottom of the stem. I repotted the plant in a small pot and placed it in a warm moist atmosphere. It is now growing very nicely, and is breaking all over. Being afraid to propagate from the young wood for fear of the insects, I took from the roots about four or five pieces, which I divided into two or three, and to my astonishment they not only broke but sent out from three to eight shoots each. I cut the roots off three weeks ago, and the shoots are now an inch long. As it is difficult to get this plant to break low down, propagating by roots appears to be a good way to get low bushy plants.—*A. Threlkeld, Headingly House, Leeds.*

Pheasants' Eggs.—I had given me a "clutch" of the common pheasant's eggs, numbering fifteen, with the caution that they had already been "setting upon." Twelve hours elapsed from the time of their being taken from the nest and reset, the eggs at the time being quite cold and apparently useless. At the expiration of twelve days, to my surprise every egg produced a bird, which is now very strong and healthy. Some years since I had brought me twelve eggs of the sheldrake (Anas tadorna), and in this instance they had been laid upon bricks in the open yard for 15 or 16 hours before they were reset, and at the expiration of 24 hours every egg was hatched, and I succeeded in rearing all. These instances show the great changes of temperature the incipient germ of life is capable of sustaining.—*V.*

Standard Roses.—I have experienced some difficulty in the cultivation of these. I have a great dislike to seeing Standard Roses closely pruned, and I think that pruning makes the French Moss and other small growers unhealthy, whilst the more robust are induced to make wood instead of bloom. I have not pruned my plants so much as most other persons, but I found that when it became necessary to reduce the size of the heads many of the plants died. The wood being very hard, and the buds small, they had great difficulty in putting out in spring, and the "heath dock" generally eat out the buds, or they were attacked with grubs. An idea struck me that if they were cut directly after blooming, they would put out soon after, and have time to form heads before winter. I tried several last year, which are now fine and healthy, and have all the appearance of being planted about two years. I would not advise it as a regular mode of pruning, but under the circumstances I have mentioned I imagine it will be found useful once in three or four years.—*J. R. Pearson, Chilwell Nurseries.*

American Blight.—I had three Apple-trees covered with this blight, which I had scrubbed with a hard brush and strong soap-suds several times without effect; but after the trees were quite dry from the last scrubbing, I had them anointed with linseed-oil, applying it with a painter's brush; this has entirely removed every vestige of the disease.—*J. G.*

The Pine Apple.—Having observed that you invite persons disinterested in the matter, to make statements concerning the quality of the Thornfield Pines, I, although I have never seen any of the fruit in question, beg to be allowed to state that I approve of Mr. Hamilton's practice with regard to moisture, and that I follow a similar course with the most beneficial results. My method is to grow the plants as fast as possible from the beginning, never allowing them to experience a check if I can possibly avoid it. They are subjected during the whole of their growth to a very moist atmosphere, as I never fail to sprinkle them over-head until the fruit is in bloom. When they are in this state, the walls of the pits are wetted every evening before shutting up; and as soon as the bloom has dropped, watering over-head is again resumed, and continued until the fruit begins to change colour. When this occurs, watering is discontinued altogether, with the exception of occasionally wetting the walls and pipes. When the atmosphere of the pits is too dry, I prefer a good bottom-heat, which enables me to give abundance of air in fine weather. This adds greatly to the strength of the plant, and is most essential to the flavour of the fruit. Under this treatment the fruit of our Queens generally weigh from four to five pounds each. The plants are grown in pots seldom larger than twelves. The fruit of these have pips flat and large, more like those of the Providence than of the Queen; they are of the brightest colour, and of the highest flavour, abounding in juice of the richest quality. When grown in a dry atmosphere I have seen the same kind, and also other varieties, having more the appearance of the head of a Teasel than that of a Pine-Apple. These facts prove that moisture is not injurious to the flavour of the Pine-Apple.—*C. J.*

Singular Propensity of a Cat.—A friend of mine has a favourite female cat who is fond of raw potato parings. Every time the gude wife begins to prepare the potatoes for cooking, puss leaves her warm corner, and begins purring and mewing, and patting with her paw, till a paring is given her, which she immediately devours with much relish. As soon as she has finished, she renews her supplications, is served again, until the potatoes are all pared for the bipeds of the family. What is more remarkable, the parings do not appear to disagree with grimalkin, who is fat and sleepy. Her descendants do not inherit this strange propensity.—*A. T.*

The Froth Fly.—Upon referring to p. 508, vol. ii., of the *Chronicle*, I find "Ruricola" to be in error when saying, "On removing the froth the small green larvæ will be found concealed, and are able to skip away when disturbed." Now in this state skip they certainly cannot, and but very imperfectly walk. He also says, "But when and where the female lays her eggs is still undiscovered, but most probably in the young twigs or buds which are formed to produce leaves the following spring." If so, I would ask how comes the froth, with the larvæ of the insect in it, upon my Bouvardias, which were raised from small pieces of roots, and even upon seedling plants in my greenhouse? and again, upon the young shoots of hardy Fuchsias in my borders, which have died down in autumn, and had their roots covered

with cinder-ashes, or something of the kind, to defend them from frost? If the froth is found in March and April upon plants thus raised from roots, and upon seedling plants (which myself and some of my neighbours have frequently experienced), how can "the eggs be deposited on the young twigs or buds?" I am quite at a loss to conjecture how they are generated; but possibly this notice may meet the eye of some one who can solve the mystery.—*A Constant Reader.*

Potter's Liquid Guano.—I write these few lines to describe the wonderful efficacy of the liquid guano. Peas, Onions, and Asparagus have been singularly improved by it, especially during the dry season. People come to admire the appearance of the garden.—*S. W.*

Miscellaneous.—*An Arbroath Gardener* states that he sowed the Early Kent Pea on the 29th November, and gathered a dish on the 24th May; he informs us that he sowed the Early May on the same border on the 7th November, which was not ready for gathering until the 8th of June. He sowed Early Kent, Prince Albert, and Sutton's Champion on the 17th February. The Early Kent, he remarks, will be ready at least 10 days before the others. He writes that there is no difference between Prince Albert and Sutton's Champion, with regard to earliness.

Societies.

HORTICULTURAL SOCIETY.

THE SECOND EXHIBITION of the season, in the gardens of the Horticultural Society at Chiswick, took place on Saturday last. The day was very auspicious—a gentle south-west breeze prevailing throughout it; and a number of very rare and beautiful plants were brought together. The Gardens, as a matter of course, in this droughty season, were much parched up; but though the borders lacked the usual gaiety of a June garden-scene, there was no dearth of gaiety of a more animated nature. Long as we have been in the habit of attending these *fêtes*, and celebrated as they are for the vast number of visitors which attend them, we were not prepared for the scene of Saturday last. No sooner were the gates thrown open than the garden was crowded, and from 2 o'clock until 6 there could never have been less than ten thousand persons present at one time; the grounds were literally crammed, more than 13,500 visitors having passed the gates. This, we think, is a sufficient proof of the increasing popularity and taste among the wealthy of the land for gardening pursuits; and to the professional gardener it must be a source of high gratification to see his peculiar occupation so much honoured. The Exhibition, taken as a whole, was less brilliant than usual; but, nevertheless, many plants were shown in finer condition than they had ever before been seen, and the display of fruit was superlatively excellent. The collections of Orchidaceous plants were very rich, as were also the Pelargoniums and Roses in pots; the large collections of stove and greenhouse plants from Ealing Park contained many admirable specimens; and of single specimens and new and rare plants exhibited for the first time there were some very remarkable things. The new Melons from Bokhara and Cabul were shown in fine condition, and it is not too much to say they fully realised all that has been said of them, and there is a peculiar crispness and freshness, accompanied by delicious sweetness, which surpasses every other kind of Melon we have ever tasted. The Bokhara Melon which we tasted, though not quite ripe, we could only compare to iced sugar; and when fully matured, it will, from its size and flavour, be esteemed as the very best kind in cultivation. The great facilities offered by the tank and other new systems of heating horticultural structures, promises to bring this fruit into universal cultivation, and in a few years the small amateur and even cottager will calculate as certainly upon his Melons as he does at the present time upon his Cucumbers. But we must proceed to a more detailed account of the Exhibition.

Among the curious tribes of ORCHIDACEOUS PLANTS, Mr. Mylam, gr. to S. Rucker, Esq., of Wandsworth, produced a large collection in remarkable health and beauty. Among them we noticed the lovely Saccolabium præmorsum, with two fine spikes of its delicately beautiful flowers; a grand plant of S. guttatum producing eight spikes of bloom; a fine specimen of Aerides odoratum; another plant with nine spikes of bloom, A. odoratum var., and a remarkably handsome kind called A. affine. A singular and very beautiful species of Anguloa, with large pale cream-coloured flowers, slightly tinged with greenish orange, was sent from the same place, as were also a fine plant of Cattleya Mossiæ, with seven of its charming flowers, and C. Mossiæ variety, with eight fine blooms. The rare and curious Angræcum caudatum was also produced by Mr. Mylam, as were likewise the neat and elegant Dendrobium densiflorum, with ten spikes of its peculiarly-tinted pale orange flowers. There was, moreover, the finest bloomed specimen of the admirable Phalænopsis amabilis we have yet seen. It had a fine spike of eleven flowers; and, gently moving in the breeze, it looked the most lovely of all the lovely things around it! A good plant of Cycnoches chlorochilon, with curious pale-green flowers, was also produced by Mr. Mylam, as were likewise the well-known C. Loddigesii. Of the plants of this remarkable tribe, which rank more particularly as curiosities, there was a very healthy specimen of Maxillaria stapelioides, the pot of which was densely covered with strange brown flowers, spotted with green, which resembled so many blooms of the singular Stapelia. Two other very curious plants were Cirrhæa viridipurpurea, with greenish-purple flowers, and C. fusco-lutea with pale-yellow and brown flowers. These flowers depended over the sides of the pots, and so closely did they resemble insects, that a lady remarked, "An entomologist viewing them for the first time, would be afraid to venture near the plant, lest he should frighten the insects away before he had taken a proper view of them." Mr. Mylam also produced fine plants of Phajus albus, with fine white flowers; Oncidium papilio; the curious butterfly plant, O. pulvinatum, in good bloom; Epidendrum cinnabarinum and alatum with finely coloured flowers; E. macrochilum roseum, curious and pretty; E. aloefolium, growing on a block of wood; and a fine specimen of Brassia brachiata. The appearance of this collection of plants was very rich, the specimens being in the finest health, and the flowers as perfect as they possibly could be.—From the gardens at Ealing Park, Mr. Robertson, Mrs. Lawrence's gardener, contributed a large collection, among which was particularly conspicuous a large plant growing in a rustic basket, of Stanhopea tigrina, with six of its large and singular dark-brown flowers, which were produced beneath the bottom of the basket.—Of Cattleyas, Mr. Robertson produced C. Mossiæ with two fine flowers; C. Mossiæ variety, with pale pinkish flesh-coloured flowers; another variety of C. Mossiæ of the same colour, but with a large blotch of purplish crimson on the lip, and a very lovely specimen of C. violacea with two flowers.—Small plants of Barkeria spectabilis, and a pale variety of the same, were sent by Mr. Robertson, and a large specimen of Bletia Shepherdii, which was past the meridian of its bloom. There was, moreover, a very fine specimen of Oncidium Lanceanum, with remarkably large blooms; a good plant of O. Papilio with six flowers; O. Russellianum and Bowesianum in good bloom, and an immense plant of O. flexuosum, the flower-branches of which being trained to the front, formed a dense mass of bloom four feet high and three feet in diameter. Mr. Robertson also sent a very healthy specimen of Brassia brachiata, with pretty cream-coloured flowers spotted with brown; the before-mentioned Maxillaria stapelioides in fine bloom, with Epidendrum variegatum; the pretty E. cinnabarinum; the curious Galeandra Baueri, with a fine specimen of Cycnoches ventricosum, and an unnamed species of Cyrtochilum.—A third collection was produced by Mr. Redding, gr. to Mrs. Marryat, at Wimbledon, among which was a good specimen of Stanhopea grandiflora, with four fine cream-coloured flowers, Cattleya Mossiæ with nine flowers, Epidendrum variegatum, Odontoglossum maculatum, and Vanda Roxburghii, in fine health. Mr. Redding also communicated neat specimens of Oncidium ampliatum majus, O. pulvinatum, Bauerianum, and luridum.—From the Nursery of Messrs. Rollisson, of Tooting, were good specimens of Stanhopea oculata and saccata in fine bloom, a small plant of Barkeria spectabilis, Epidendrum cinnabarinum, with Oncidium volubile, luridum guttatum, pulvinatum, flexuosum, and luridum.—Mr. P. N. Don, gr. to G. F. Cox, Esq., of Stockwell, sent Stanhopea tigrina, with two flowers; Cattleya Mossiæ, in good condition and remarkably well coloured; a neat plant of Acropera Loddigesii, with Oncidium pulvinatum and flexuosum.—Of single specimens, Messrs. Veitch and Son, of Exeter, sent a noble plant of Oncidium Lanceanum, with twelve flower-spikes.—Mr. Falconer, gr. to A. Palmer, Esq., of Cheam, sent Brassia caudata in very fine condition; and Mr. Carson, gr. to W. F. G. Farmer, Esq., of Enfield, a good plant of Cattleya Mossiæ.

The large collection of STOVE and GREENHOUSE PLANTS contributed by Mr. Robertson, gr. to MRS. Lawrence, was unusually fine, and certainly could not be surpassed by any collection in the country. When so many plants are required to constitute a collection, it is not unusual to see some bad plants, but here they were all good, all evincing first-rate management. To give some idea of the beauty of this group at the back, on the centre of the stage stood an immense plant of Acacia alata ten feet high, and at least twelve feet in diameter, the head forming a complete ball, so thick that a bird could scarcely fly through it, and densely covered with its pale lemon-coloured flowers. Flanking this were two immense plants of Polygala oppositifolia, covered with bloom, and in the front of it a most noble plant of Pimelea decussata six feet high and six feet through, regularly branched from the pot upwards, and a complete sheet of inflorescence. This plant, with the exception of the flowers being a little pale, which was doubtless attributable to the shade necessary to retard its blooming in this sunny season, was in every respect perfect. Another very remarkable plant was Phœnocoma prolifera, a plant two feet high and about the same in diameter, the branches drooping over the sides and partly hiding the pot, and every branch tipped with its curious everlasting flowers; scarcely less excellent was a plant of Leschenaultia formosa one foot high and nearly three feet in diameter; and a plant of the same size, and a mass of flowers, was Stylidium fasciculatum. Mr. Robertson, moreover, contributed a noble specimen of Aphelexis sesamoides, in fine bloom, and an admirable specimen of Acacia pulchella; this plant was about 6 feet high, and the same in diameter, forming a regular globe, and in fine bloom. Of Manettia cordifolia there was a splendid specimen, trained over an hemispherical trellis; it was profusely covered with flowers, and in every respect a first-rate plant. Leschenaultia biloba, the pale variety; Boronia denticulata, Begonia nitida and parvifolia, Chorozema varium nanum, Siphocampylus betulifolius, Hindsia longiflora, Lobelia longiflora, Gloxinia violacea and maxima alba, and Achimenes longiflora, rosea, and grandiflora, were shown in fine condition; and finally, there was a prodigious plant of Erythrina crista galli, covered with bloom, and two exceedingly fine specimens of Clerodendrum affine; the largest plant was 5 feet high, and the head of bloom consisted of eleven spikes of flowers; the second plant was not quite so large, but both evinced excellent management.—The collection from Mr. Green, gr. to Sir E. Antrobus, Bart., at Cheam, contained neat specimens of Eutaxia pungens, in fine bloom; Leschenaultia formosa, dwarf and good; Hibbertia Cunninghamii, densely covered with pale-yellow flowers; Rondeletia speciosa, and Sollya linearis, profusely covered with bloom. Mr. Green had, moreover, a large plant of Epacris heteronema, with Ixora coccinea, much injured by its previous journey to Chiswick; Lachnæa purpurea, in good bloom; Tropæolum edule, with orange flowers; Stephanotus floribundus, and a large specimen of Cosmelia rubra.

Of CLIMBERS, Mr. Robertson sent a collection, consisting of a most admirable specimen of Stephanotus floribundus, completely covered with its deliciously fragrant flowers; very large specimens of Manettia cordifolia and bicolor, the former covered with bloom; a remarkably healthy specimen of Poivrea coccinea, and a good plant of Hardenbergia monophylla. From the same garden was a fine plant of the beautiful Clitoria Ternatea, but unfortunately the blooms, which are of the finest blue imaginable, are too scantily produced for the plant ever to become generally cultivated.

Among NEW PLANTS some very admirable things were produced.—From Her Majesty's garden at Windsor, Mr. Ingram sent one of the finest of New Zealand plants, called Veronica speciosa. It was a very fine healthy specimen, and had 11 spikes of rich purple flowers.—From the Royal Botanic Gardens at Kew, Mr. Smith, the curator, communicated Pterodiscus speciosus, a plant with rosy purple flowers bearing a close resemblance to a Mimulus; and from their nurseries at Exeter, Messrs, Lucombe, Pince, and Co. sent Ixora acuminata, a plant producing a large head of white flowers, and promising to become a useful though not a very conspicuous plant for public exhibitions.—Messrs. Loddiges, of Hackney, sent a very lovely species of Epacris called E. miniata. It has rich vermilion-coloured flowers tipped with white, and they are produced in very great abundance.—Clerodendrum infortunatum, a plant very superior to any of the old kinds, was sent by Mr. Glendinning, nurseryman, of Chiswick. It is a plant of free growth and robust habit, with flowers both larger and brighter than C. affine; and from the same gentleman was a plant of Achimenes picta and three hybrid varieties of Gloxinia. The Achimenes has flowers resembling A. pedunculata, but they are finer formed and more intense in colour; and the plant is of dwarf compact habit, with the leaves bearing a sort of silvery variegation.—Of the Gloxinias, one which is in cultivation under the name of G. Cartonii, has pale crimson flowers margined with white, and as it branches freely, promises to become a first-rate plant; a second plant bore a close resemblance to this, but was not so good; and the third was of a pale violet colour, with a deep purple blotch in the throat, which gave it a very neat appearance.—Mr. Slowe, gr. to W. R. Baker, Esq., of Bayfordbury, Herts, sent a small plant of Pavetta caffra.—Mr. Green, Gompholobium splendens, a plant with rich yellow flowers.—Mr. Bruce, gr. to Boyd Miller, Esq., sent a new species of Kennedya from New Holland, with greenish-white flowers; and Mr. Jackson, of Kingston, a finely bloomed plant of the new annual, called Viscaria oculata; and, finally, from Mr. Ayres, gr. to James Cook, Esq., Brooklands, Blackheath Park, was a plant of Pentas carnea, with ten heads of its delicately tinted pale peach-blossom coloured flowers. Messrs. Veitch and Son, of Exeter, sent cut specimens of Hindsia longiflora and violacea.

Of single specimens of OLD PLANTS, Mr. Green produced an Azalea, upon which the three following kinds, viz., A. Indica variegata, lateritia, and Gladstanesii, had been grafted, and with the flowers intermixed, had a very novel and pleasing appearance. Mr. Green had also fine specimens of Gompholobium polymorphum, in fine bloom; Aphelexis humilis, a fine specimen, but the flowers badly coloured; Coleonema rubrum, a very excellent plant; and a small, but promising plant of Chorozema ovatum.—From Mr. Dawson, nurseryman, of Brixton-hill, was a very large plant of Erica Massoni, in most excellent health and fine bloom.—Mr. Robertson communicated E. ventricosa, densely covered with bloom; and E. depressa, evincing equally good management. Mr. Robertson, moreover, contributed a lovely plant of Gesnera lateritia; a superlatively excellent plant of Gloxinia maxima alba, covered with hundreds of flowers; and a very large plant of Erythrina crista-galli.—From Mr. Falconer was a very lovely specimen of Leschenaultia formosa, and a very large but badly bloomed plant of Achimenes longiflora.—Mr. Dobson, gr. to Mr. Beck, of the Slate Works, Isleworth, had a very fine specimen, in a slate pot, of Achimenes grandiflora, and a small but finely-bloomed plant of Rondeletia speciosa.—Mr. Jackson, of Kingston, sent Dracophyllum secundum, with very curious flowers; and Messrs. Lucombe, Pince, and Co. the rare pale-yellow and white asclepias-flowered plant, called Cyrtoceras reflexum.—From Mr. Jones, gr. to Sir Moore Disney, at East Acton, was a neat plant of Leschenaultia formosa, covered with bloom, and a large specimen of Fuchsia grandiflora maxima.—Mr. Pamplin, nurseryman, of Walthamstow, produced a finely bloomed, but unnaturally trained plant of Boronia serrulata; and Messrs. Mountjoy and Son, of Ealing, sent Lilium testaceum, with pale, creamy, buff flowers.

Of the beautiful tribe of ERICA there was a very fine

display. Mr. Robertson produced very neat specimens of E. perspicua nana in fine bloom; tricolor elegans very neat and pretty; tricolor in fine health; inflata alba very fine; Cavendishii, a superb specimen in excellent condition: gemmifera, one foot six inches high and two feet in diameter, and in fine health; prægnans, remarkably healthy; and metuliflora bicolor, in fine condition. Mr. R. had, moreover, a very lovely plant of E. ventricosa rosea globosa, growing in one of Mr. Beck's slate pots, and in remarkable health and bloom; he had also fine plants of E. ventricosa alba, E. v. tenuiflora, E. v. stellata, and E. v. superba, each a mass of flowers; a good plant of E. radiata, not quite sufficiently in bloom; and fine plants of E. breviflora, Westphalingia, splendens finely bloomed, but an indifferent plant; and a promising specimen of E. Humeana.—Mr. Brazier, gr. to W. H. Storey, Esq., of Isleworth, produced fourteen seedling varieties of E. vestita, ventricosa, and grandiflora kinds, originated by Mr. Storey, and some of them very beautiful. They consisted of E. vestita albida, a lovely plant; E. v. alba superba, very pretty; E. v. rosea alba, delicate rose-colour, elegant; E. grandiflora lucida, very neat; E. g. purpurascens; E. ventricosa carnea; E. ventricosa coccinea superba; E. Longiflora floribunda, a splendid kind; with E. variabalis, Albertiana, and Albertiana superba. It is rather melancholy to reflect, that while we are writing, the noble collection of Ericas, and other plants of Mr. Storey, which the public have so frequently looked upon with delight, at Horticultural Exhibitions, are being disposed of by public auction.—In the group of six Heaths Mr. Green had fine plants of E. elegans and tricolor elegans, in fine bloom; E. perspicua nana and ventricosa superba, loaded with bloom; and tolerable plants of E. splendens and Cavendishii.—Mr. Dawson, of Brixton-hill, sent E. pulverulenta, nicely in bloom, and forming a cone of verdure three or four feet high by six inches in diameter at the base; very handsome plants of ventricosa globosa and tricolor elegans; and neat specimens of Bergiana, Massoni, and the admirable little Coventryana.—From the nursery of Mr. Jackson, of Kingston, was a collection of very large specimens: it contained an immense plant of E. ventricosa Bothwelliana, a plant four feet high and three feet in diameter, covered with bloom; E. tricolor speciosa, with neat pale-red flowers; E. tricolor, a seedling variety, very superb; a fine plant of the singular E. halicacaba, with pale-green flowers; E. moschata, covered with small greenish-yellow blooms; and a fine plant of E. depressa. Mr. Jackson had, moreover, fine plants of what he called E. Patersoniana, var. Cavendishii; E. vestita coccinea, large, but past its best; a fine Jasminiflora alba; the singular E. Plukenetii, with dull-red flowers; a fine large E. elegans odorata, not quite in bloom; an excellent plant, three feet high and two feet in diameter, of E. translucens, with pretty pink flowers; and tolerable specimens of E. inflata and carnosa.—In the collection from Messrs. Rollisson, of Tooting, were several of those curious Heaths, which are rarely met with at public exhibitions: they were E. sanguinolenta, with small, dark, blood-coloured flowers; E. thymiflora, resembling a large plant of the old Mother of Thyme; E. imbricata, very singular; and E. villosa, with a silvery-greenish appearance. In this collection were also a very fine variety called E. Massoni major, a plant of much more vigorous habit, and with flowers of a finer colour than E. Massoni. There were, moreover, good plants of E. ventricosa superba, in fine bloom; E. v. carnea, E. v. prægnans, E. v. stellifera, and E. v. tenuiflora. Messrs. Rollisson had, finally, good plants of E. jasminiflora nana and vittata, and well-bloomed specimens of E. Coventryana, grandiflora, Cavendishii, and mundula.

The collections of Cacti, though of course brilliant, did not contain any very novel kinds. Mr. Robertson had fine plants of Cereus speciosissimus, Epiphyllum Ackermanni and Jenkinsonii, and good plants of E. splendens, speciosus, and Jenkinsonii major.—Mr. Falconer had a fine plant of Cereus Mallisonii in fine bloom, speciosissimus, with Epiphyllum Jenkinsonii and Ackermanni in rich order, and several other varieties.—From Mr. Green were plants of Epiphyllum speciosum, elegans, Jenkinsonii multiflorum, splendens, and aurantiacum, with orange-scarlet flowers; neat plants of rubrum grandiflorum, speciosum purpureum, formosum, and Ackermanni violaceum. He had also Cereus speciosissimus, with C. Mallisonii, and a variety of the latter called C. strictus, with very pale-red flowers.

The Garden of the Society contributed some fine specimens of Pinuses in pots, among which we noticed P. filifolia, tenuifolia, Apulcensis, patula, Russelliana, Montuzemæ, macrophylla, Devoniana, religiosa, and Hartwegii. There were also Juniperus tetragona and flaccida, a curious climbing plant, with green campanulate flowers striped with brown, called Codonopsis lurida; and a large fruiting specimen of Musa Cavendishii.

Of Wardian Cases there was only one example, which consisted of succulent plants in small pots. They had a neat and interesting appearance, and to our knowledge they have been growing in the same case for several years. They were from Mrs. Leigh, F.H.S., of Turnham Green.

Roses in Pots were shown, in fine condition, by Mr. Dobson; Messrs. Lane and Sons, of Berkhampstead; Paul and Sons, of Cheshunt; Alexander Rowland, Esq.; and Mr. Cobbett, nurseryman, of Chobham. The two latter collections were in no way remarkable; Mr. Cobbett's, which were principally Moss Roses, having flagged early in the morning, and Mr. Rowland's being less skilfully grown. Mr. Dobson's collection, though evidencing good management, were principally dwarf standards, which for pot culture we consider in doubtful taste. They look too artificial, and, let them be ever so well done, will never approach our standard of what pot Roses ought to be, or accomplish what the Society has in view, viz., show the real character of the plant. The only way in which standards can be at all admissible will be when the branches are trained pendantly, so as to hide the naked stem, and indeed in this way some of the stronger-growing kinds of French Hybrid China, Noisette, Hybrid Perpetual, and Damask, when trained over balloon or other fancy-formed trellises, will make very beautiful objects. To satisfy our taste, we must also see dwarf Roses grown without each flower being supported by a stick; for, however much such arrangement may be necessary for the proper conveyance of the plants from place to place, a Rose that will not do without them is unfit for pot culture. These remarks apply to Rose-growing generally, and not to Mr. Beck's in particular. The kinds produced by Mr. Beck were Aspasia, La France, Mrs. Bosanquet, Pompone Laquene, Hortense Leroy, Brennus, Belle Marie, Coutard, and Madam Nerard. — Messrs. Lane's collection consisted principally of dwarf kinds, and had been most excellently managed. They consisted of Moire, Blanchefleur, Duke of Devonshire, Great Western, Duc de Cases, Armosa, Scholastique, Madame Plantier, Boule de Nanteuil, Pomone, Therese, Isabella, Comtesse de Lacepede, Augustine Lelieur, Augustine Hersent, Pierre St. Cyr, Auteros, and Triomphe de Luxembourg.—The greater part of Messrs. Paul's were dwarf standards, but were in very fine bloom; the best were named Daubenton, Duke of Cambridge, Madame Desprez, Ipsilante, Agnessan, Taglioni, La Pactole, Comte Lacepede, Buonaparte, Sophie de Marcilly, Beauty of Billiard, and Roi de Rome.

Of Cut Roses a great quantity were exhibited from various parts of the country. The kinds sent by Mr. Rivers, nurseryman, of Sawbridgeworth, were *Hybrid perpetual:* Mrs. Elliot, Prudence Rœser, Madame Laffay, Duc d'Aumale, Duchess of Sutherland, Aubernon, and Louis Buonaparte. *Hybrid China:* Fulgens, Coutard, Velours Episcopal, Kleber, Beauté vive, Chenedole, Eucharis, Vingt neuf Juillet, Blanii No. 2, Triomphe d'Angers, Pangot, Coupe d'Amour, Brennus, Pompone Bicolor, Beauty of Billiard, and Triomphe de Laquene. *French:* Royal Marbled, Adelaide, Renoncule ponctuée, Boule de Nanteuil, Kean, and Madame Cottin. *Damask:* Madame Hardy and Deesse de Flore. *Hybrid Bourbon:* Coupe d'Hebe, Charles Duval, Belle de St. Cyr, Great Western, Colonel Combes, Sylvain, and Brillante. *Alba:* La Séduisante and Princesse de Lamballe. *Provence:* Sylvain and Crested. *Hybrid Provence:* Blanchefleur and Duchesse d'Angoulême; with *Tea* Elise Sauvage, Persian Yellow, Harrisonii, Eclat des Roses, and Oracle de Siècle. Mr. Rivers had also the following kinds of Moss Roses—Prolific, Crimson, French Crimson, Pompone, Celina, White Bush, Blush, Princess Royal, Single Crimson, Unique de Provence, Pompone fin, and Luxembourg.—In Messrs. Paul's collection of cut Roses were very fine specimens of the following kinds:—Marie de Medicis, Madame Gernin, La Séduisante, Blanchefleur, General Allard, Madame Hardy, Comte de Paris, Lady Stuart, Adele Prevost, Carré de Boissiloup, Duchesse d'Angoulême, Densiflora, Comtesse de Lacepede, Rouge Eblouissante, Niphets, Stadtholder, Triomphe de Laquene, Brennus, Amiable Queen, and Duchess d'Abrantes.—Mr. Hooker, Nurseryman, of Brenchley, Kent, had the annexed kinds: Prince Albert, Wm. Jesse, Celinette, Hymenæa, Malton, Blanchefleur, Princess Augusta, Coupe, Duke of Sussex, Reine des Isles Bourbon, Devoniensis, Persian Yellow, Octavie, La Calarisseme, Camellia blanc, and odorata. Mr. Hooker also exhibited six seedling varieties, one a light yellow Scotch; another like Village Maid, with the Emperor of Russia, Burgundy, a seedling Moss, and Gallica.—From Messrs. Lee, Nurserymen, of Hammersmith, were several boxes of admirably-arranged flowers, the advantage consisting in arranging each colour in a separate line across the box, instead of in large bunches, and so intermixing the colours that each may enhance by contrast the beauty of its neighbour. The best kinds were Madame Dubarry, Blanchefleur, Glory of France, Sophie de Marsilly, Fimbriata, Lady Sefton, Duke of Devonshire, Fanny Parissot and Leon 10th.—Mr. C. Cobbett, Nurseryman, of Chobham, produced fine blooms of the following:—Fulgens, Victor Hugo, Coutard, Armosa, Duc d'Angoulême, Brennus, La Grandeur, Robin Hood, Painted Damask, Waterloo, William Jesse, Brennus Superb, Comtesse de Lacepede.—Mr. Francis, Nurseryman, of Hertford, and Mr. Bennett, Nurseryman, of Bath, also sent collections of very fine cut Roses.—Among private growers, Mr. Milne, gr. to C. S. Chancey, Esq., had very fine specimens of the following varieties:—Parry, Rivers's Superb Tuscany, Adonis, Yellow Noisette, Glory of France, Sulphurea Superba, Noisette Lamarque, and Eugene Barbot.—Mr. Dobson contributed Beauty of Billiard, Triomphe de Montmorency, Brennus, Queen of the Bourbons, Princesse Lamballe, Glory of France, Coupe de Amour, General Lamarque, and Madame Dauberg.—Mr. Slow had good specimens of Nina, Safrana, Elise Sauvage, Belle Allemande, Silene, Reine de Bontem, Mrs. Bosanquet, Queen, and Triomphe du Luxembourg.—Mr. Parsons, gr. to A. George, Esq., sent, among others, Gobault, Melaine, Taglioni, Madame Hardy, Julie Etanges, Las Casas, Brennus, Remarquable, Charles-Louis, Sir W. Scott, Therese Isabelle, Madame Plantier, Noisette Lamarque, Bougere, Kean, and Niphet.—From Mr. Laing, of Twickenham, were Jaune Desprez, Adele Prevost, Lamarque, Deesse de Flora, Ida, Hamon, Aurora, Las Casas, and Triomphe de Lamarque.—Cut Roses were also shown by A. Rowland, Esq.; Mr. Butler, gr. to — Symons, Esq., Norbiton, Surrey; and Mr. Stanley, gr. to H. Berens, Esq., Sidcup, Kent. We regret, however, to state that, in consequence of Mr. S. attending to the packing of his other plants before he went to the Roses, the whole of them were purloined; we doubt not, by persons who, from their appearance, ought to have known better.

As has been before observed, the Exhibition of Fruit was of a very superior description. Mr. Henderson, gr. to Sir George Beaumont, Bart., exhibited, in a collection, some very splendid Black Hamburgh Grapes, very fine Cabul Melons, two Queen Pines, beautifully swelled, and also excellent Peaches and Nectarines. This collection was very excellent, and we should say, taking it altogether, no man ever produced a finer one.—In Mr. Spencer's (gr. to the Marquess of Lansdowne) collection were very fine Providence Pines, tolerable Grapes, good Green-flesh Melons, and four dishes of very fine Peaches and Nectarines.—Mr. Dodds, gr. to Sir George Warrender, Bart., sent some very good Melons, tolerable Pines, Black Hamburgh and Muscat Grapes, and very good Peaches, Nectarines, and Red and White Currants.—Of Pines, four very superior Queens, weighing from 4 lbs. to 5 lbs. each, were shown by Mr. Dodds, gr. to Col. Baker; three fine Queens, but not quite so well swelled as Mr. Dodds's, by Mr. Henderson; two Queens by Mr. Wharton, gr. to Miss Whitehead, Weston, Bath; two Providence, an Enville, and a Queen, by Mr. E. Davies, gr. to A. Smith, Esq; four fine Providence by Mr. Fielder, gr. to W. Linwood, Esq.; and a long but badly swelled Enville from Mr. Gladmore, gr. to J. Berens, Esq., Revington, Kent.—The Bokhara Melon sent by Mr. Henderson was about 12 inches long and 6 inches in diameter, tapering slightly from the middle to each end, and of a dull brownish-green colour.—The Cabul Melon is a yellow slightly-netted kind, not unlike the Keising, and three exceedingly well grown ones were sent by Mr. Carson, gr. to F. G. Farmer, Esq.—Another new kind, called the Benares Melon, of large size, was sent by Mr. Carmichael, gr. to Mrs. Hawkins; good specimens of Anderson's Green-flesh Melon, by Mr. Terry, gr. to Lady Pullen; four fine Egyptian Green-flesh, by Mr. Falconer; and some Green-flesh and Putterridge Green-flesh by Mr. R. Fish, gr. to Colonel Sowerby; some indifferent Melons were sent by Mr. E. Davies, and Cuthill's Early Melon by Mr. Wharton. — Some very excellent Royal George Peaches were sent by Mr. Foggo, gr. to the Marquess of Abercorn, at Stanmore Priory; Elruge Nectarines, very fine, by Mr. Henderson; and well-grown Noblesse and Royal George Peaches, and fine well-coloured Nectarines by Mr. Fleming, gr. to the Duke of Sutherland.—Fine Royal George Peaches and red Roman Nectarines were sent by Mr. Mitchell, gr. to Lord Vernon; and very fine but badly-coloured Royal George Peaches and Nectarines by Mr. R. Fish.

Of Grapes there were scarcely any bad ones; but the Black Hamburghs shown by Mr. Henderson, and the Black Hamburgh and white Frontignan by Mr. Thompson, gr. to Sir J. L. Goldsmid, Bart., left nothing to be wished for; they were large bunches, large berries, well-coloured, and perfectly ripened.—Mr. Frost, gr. to Lady Grenville, also produced fine bunches of Black Prince, White Muscat of Alexandria, and Black Hamburgh; but the last were rather deficient of colour, and the Muscats were not quite ripe.—Mr. Parsons, gr. to A. George, Esq., had some well-coloured and ripened Black Hamburgh and Muscadines, and Mr. Dodds, gr. to Sir G. Warrender, had also some fine Black Hamburghs.—Mr. Fielder, gr. to W. Linwood, Esq., sent some good Black Hamburghs, but those belonging to Mr. Atlee, gr. to H. Beaufoy, Esq., Mr. J. Fish, gr. to H. H. Oddie, and Mr. Gadd, of Betchworth, though fine, were not, as compared with others, quite sufficiently coloured.—Mr. Mitchell, of Brighton, sent fine Black Hamburghs, but those from Mr. Wilmot, of Isleworth, were not well-coloured, and not near ripe.—Fine Keen's Seedling and British Queen Strawberries were sent by Mr. Ledgard, of Batheaston, and good Keen's Seedling by Mr. R. Fish and Mr. Elliot, gr. to J. Boothby, Esq.—A plate of Apples was produced by Mr. J. Fish, and a Cucumber, by no means remarkable for June, by Mr. Mills, of Gunnersbury.

The Pelargoniums contributed more than their usual share to the gaiety of the Exhibition, and the crowded state during the day of the seedling and exhibition tents, bore evidence of the increasing popularity of this delightful flower. There were three competitors for the Gold Medal in the Amateurs' Class of 12 new and first-rate varieties, in pots of 24 to the cast; the first Prize was awarded to Mr. Cock, of Chiswick, for the following 12 plants, produced with his accustomed skill:—Paragon, Sir R. Peel, Eclipse, Emma, Hebe, Queen of the Fairies, Black Dwarf, Erectum, Sarah, Garth's Queen Phillippa, Unit, and Maid of Honour.—Mr. Dobson, gr. to Mr. E. Beck, received the Silver Gilt Medal, being the second Prize for the following finely cultivated flowers, grown in slate pots, corresponding in size to 24s.:—Majestic, Matilda, Queen of Fairies, Bella, Leonora, Martha, Sarjeant, Flora, Angiola, Conflagration, Sir R. Peel, Susanna.—The third Prize, being the large Silver Medal, was awarded to Mr. Coysh, gr. to R. Hudson, Esq., Clapham; this collection consisted of the following varieties:—Beauty, Nymph, Prince Albert, Comte de Paris, Venus, Sylph, Erectum, Lord Mayor, Phillis, Priory Queen, Matilda, Madeleine.—In the Nurserymens' Class the only exhibitors were Mr. Gaines and Mr.

Catleugh; the Gold Banksian was awarded to the collection of the former, which contained the following sorts:—Queen of Beauties. Oberon, Coronation Superb, Beauty Supreme, Witch, Orange Perfection, Pirate, Clio, Rising Sun, Princeps, Hermione, and Princess Royal. 2d Prize, Silver Gilt Medal, was awarded to Mr. Catleugh, his collection comprising Conflagration, Luna, Sultana, Flash, Paragon, Emma, Taglioni, Madeleine, Maid of Honour, Sarah, Laura.—There were three competitors in the Amateur's Class of twelve varieties, in pots of 12 to the cast. The Silver Gilt Medal in this class was awarded to Mr. J. Parker, gr. to J. H. Oughton, Esq. This collect on comprised 12 very finely cultivated varieties, uniform in size, and in perfect health—Victory, Ovid, Rienzi, Jubilee, Rosalind, Annette, Evadne, Priory Queen, Arabella, Erebus, Lord Mayor, and Comte de Paris.—The large Silver Medal was awarded to Mr. Cock for the following well-selected sorts:—Hector, Sultana, Queen of Faries, Wizard, Symmetry, Hebe, Constellation, Paragon, Rising Sun, Rachel, Nestor, and Lord of the Isles.—3d, Silver Knightian to Mr. W. Bromley, gr. to — Anderdon, Hammersmith, for Annette, Sylph, Grand Duke, Priory Queen, Exquisite, Una, Victory, Erectum, Piba, Leila Jones, Clarissa, and Coronation.—In the Nurserymen's Class, the contest again lay between Mr. Gaines and Mr. Catleugh, the former taking the 1st Prize, Silver Gilt Medal, for Juba, Albina, Lifeguardsman, Lady Cotton Shepherd, Pride of Surrey, Mabel, Arabella, Gem of the West, Priory Queen, Lady Sale, Madeleine, Alba Perfecta. Mr. Catleugh's flowers were Dido, Luna, Nestor, Selina, Hannah, Priory Queen, Madeleine, Lord Mayor, Comte de Paris, Hebe, Amulet, and Witch.—The Silver Banksian was awarded to Mr. Bourne, gr. to Sir E. Paget, for 6 varieties in pots of 8 to the cast—Lifeguardsman, Matilda, Erectum, Victory, Nymph, Madonna.

The CALCEOLARIAS exhibited this year have not been equal to those of former seasons, either in the goodness of the sorts or in their cultivation. The Amateurs', which were decidedly the best, were from Mr. Stanley, gr. to H. Berens, Esq.; to these the Large Silver was awarded; the sorts were Jewess, Magnifica, Gipsy, Auro maculata, Duke of Cornwall, and Vivid.—The Nurseryman's collection was from Mr. Gaines, and contained Candidate, Lady Elcho, Magnet, Mabel, Sunbeam, and Tigrina.

Two collections of FUCHSIAS were exhibited for competition; both were under fine cultivation. Mr. Gaines obtained the large Silver Medal for his collection, which contained the best-selected sorts which have yet appeared—Decora, Robusta, Conspicua arborea, Alata, Curtisii, Majestica, Gem, Venus Victrix, Iveryana, Victory, Excelsa, and Pulcherrima. The other collection was from Mr. R. Laing, of Twickenham, and received the Silver Knightian Medal; the following sorts comprised this collection—Stanwelliana, Arborea, Insignis, Fulgens, Multiflora, Majestica, Robusta, Laneii, Paragon, Moneypennii, Elegans superba, and Venus Victrix.

A superb collection of RANUNCULUSES was exhibited by Messrs. Tyso and Son, of Wallingford; these flowers attracted much attention, from their extreme delicacy and beauty; and, considering the unpropitious season we have had, it must have required great skill and unceasing attention to have produced such fine blooms; the collection contained Temeraire, Candale, Tippoo Saib, Kilgour's Queen Victoria, Princess Royal, Dr. Neill, Coronation, Marquess of Hertford, Ximenes, Queen Victoria, Bon Financier, &c., with the following fine seedlings raised by Messrs. Tyso and Son—Felix, Edgar Gippius, Grand Romana, Albinus, Herbert, Virginia, Attractor, Dictator, Raphael, Amasis, Jubal, Delectus, Champion, Falcidia, Eureka, Alexis, Comptroller, Tubal, Basilica, Grandis, Adolphus, Phyllis, Silverton, Innocent, Ada Cathcart, Arcadia, Solon.

The PINKS were good for the season; the collection to which the Silver Knightian Medal was awarded, was from Messrs. Norman, of Woolwich, and contained the following sorts:—Cousin's Queen of the Isles, Creed's Henry Creed, Willmer's Queen Victoria, Young John, Eclipse, Hodges' Gem, Lady Flora Hastings, Melona, Flora, Willmer's Prince of Wales, Cousins's Little Wonder, Creed's President, Majestic, Unsworth's Omega, Duke of Northumberland, Garrat's Alpha, Bunkell's Lord Brougham, Norman's William, Triumphant, Queen of Roses, W. Cobbett, Gay Lad, Creed's Miss Creed.

Seedling Calceolarias were exhibited, but none sufficiently distinct to be selected for prizes. A tray of seedling Pelargoniums from Mr. Hoyle, of Guernsey, contained some curious varieties. Cut bloom were also shown by Mr. Pamplin, of Walthamstow, and from Messrs. Lucombe and Pince. Many seedlings of great merit were exhibited: those selected by the judges were as follow:—*Sir J. Broughton*, a well-formed, compact, but rather small flower; colours high and fine; blotch on the upper petals dark and fine, gradating to the edge, which is of a bright crimson-rose; it has a small white centre, with rich purple crimson under petals. *Exactum*, good cupped flower resembling the former, but larger, and a few degrees lighter in colour; these two flowers were exhibited by Mr. Whomes, gr. to E. Foster, Esq., Clewer Manor. *Titus*, from Mr. Hoyle, of Guernsey, a well-formed flower, rosy under petals with light centre; dark rich velvety upper petals, with a distinct margin of bright rosy-carmine. *Desdemona*, Mr. Dobson, gr. to Mr. E. Beck, a fine full-sized flower of good form; under petals tinged with delicate pink; upper petals, large, stout, and of a velvety texture, of a rich maroon colour, which runs to the base of the petal, and also leaves a distinct margin of delicate rose-colour round the petals.

The following is the order in which the Exhibitors were placed by the judges:—

PELARGONIUMS, new varieties, in 24s.—*Amateurs*: 1, Cock; 2, Dobson; 3, Coysh. *Nurserymen*: 1, Gaines; 2, Catleugh.
PELARGONIUMS, in 12s.—*Amateurs*: 1, Parker; 2, Cock; 3, Bromley. *Nurserymen*: 1, Gaines; 2, Catleugh.
PELARGONIUMS in 8s.—*Amateurs*: 1, Bowen.
CALCEOLARIAS, in 12s.—*Amateurs*: 1, Stanley. *Nurserymen*: 1, Gaines.
PINKS, in 24 distinct varieties.—*Nurserymen*: 1, Norman; 2, Ward.
FUCHSIAS—*Nurserymen*: 1, Gaines; 2, Laing.
STOVE AND GREENHOUSE PLANTS, large collection.—1, Robertson.
STOVE AND GREENHOUSE PLANTS, in collections of 15.—1, Green.
STOVE AND GREENHOUSE CLIMBERS.—1, Robertson.
CAPE HEATHS, 20 varieties.—*Amateurs*: 1, Robertson. *Nurserymen*: 1, Jackson; 2, Rollisson.
CAPE HEATHS, 6 varieties.—*Amateurs*: 1, Green. *Nurserymen*: 1, Dawson.
TALL CACTI.—*Amateurs*: 1, Robertson; 2, Falconer; 3, Green; 4, Redding.
ROSES IN POTS.—*Amateurs*: 1, Dobson; 2, Rowlands. *Nurserymen*: 1, Lane; 2, Paul; 3, Cobbett.
MOSS ROSES in bunches of 12 varieties.—*Amateurs*: 1, Milne. *Nurserymen*: 1, Rivers; 2, Lane; 3, Cobbett.
OTHER ROSES in bunches of 50 varieties.—*Amateurs*: 1, Milne; 2, Parsons; 3, Slowe; 4, Rowland. *Nurserymen*. 1, Rivers; 2, Paul; 3, Cobbett & Lane; 4, Hooker & Laing.
OTHER ROSES in bunches of 25 varieties.—*Amateurs*: 1, Buttery; 2, Dobson & Bennett; 3, Stanly. *Nurserymen*: 1, Francis.
EXOTIC ORCHIDACEÆ, large collections.—1, Mylam; 2, Robertson.
ORCHIDACEÆ, in collections of 6.—1, Redding; 2, Rollisson; 3, Don.
EXOTIC ORCHIDACEÆ, single specimens.—1, Veitch; 2, Falconer & Carson.
SEEDLING FLORISTS' FLOWERS.—Whomes, Hoyle, and Beck.
MISCELLANEOUS SUBJECTS.—1, Robertson, Lucombe & Co., Storey, Tyso & Sons; 2, Falconer, Dobson, Green, Catleugh, Roberts, Jackson; 3, Mountjoy, Roberts, Green, Jackson.
FRUIT, large collections.—*Amateurs*: 1, Henderson; 2, Spencer; 3, Dodds.
GRAPES.—1, Henderson & Thompson; 2, Frost; 3, Parsons; 4, Dodds. *Nurserymen*: 1, Mitchell; 2, Wilmot.
PINE APPLES.—1, Dodds; 2, Henderson & Wharton; 3, Davis; 4, Fielder & Malpas.
PEACHES OR NECTARINES, 6 specimens.—1, Henderson, Fleming, and Monk; 2, Fish & Fleming.
MISCELLANEOUS FRUIT.—1, Terry; 2, Carmichael; 3, Lidyard.
NEW ORNAMENTAL PLANTS.—1, Ingram & Loddiges; 2, Glendinning; 3, Lucombe, Glendinning, and Smith; 4, Ayres; 5, Jackson.
BEST-NAMED COLLECTIONS.—1, Robertson; 2, Rollisson; 3, Mylam.
ARRANGEMENT OF ROSES.—Lee.

The following is the value of the Prizes gained by each exhibitor:—

Ayres, S.B., 1*l.*	£1	0	0
Beck, C., 10*s.*	0	10	0

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

June 18.—The second meeting for the season took place in the Surrey Zoological Gardens. The Exhibition was in no degree remarkable. On looking over some of the collections we could scarcely discover a well-grown specimen. Others, however, contained objects that were well deserving of notice. In the collection by Mr. Bruce, of Tooting, were some exceedingly well-managed plants, including a beautiful large specimen of Aphelexis humilis covered with blossoms; a well cultivated Erica tricolor, a small but good Leschenaultia biloba, producing pretty azure flowers in abundance, and a fine specimen of Cactus Jenkinsonii covered with bloom; together with a large Ixora coccinea, and a beautiful small Cactus Ackermanni having very large flowers.—A group by Mr. Atlee, gr. to H. Beaufoy, Esq., although inferior to these, comprised some good plants; among which was Pimelea decussata, a large Boronia denticulata, Cereus speciosissimus, in fine bloom, and a well-managed Boronia denticulata; for these a Gold Medal was awarded. The 2d Prize was given to Mr. Hamp, for Gloxinia candida, a tall plant of Erythrina crista-galli; an Amaryllis, and a good Aphelexis humilis.—Among Nurserymen, the best Collection of Miscellaneous Plants was shown by Mr. Fairbairn, who produced a beautiful Leschenaultia formosa, a scarlet Pelargonium, and small but nicely cultivated specimens of Heaths.—A large Silver Medal was awarded to Mr. Dawson, of Brixton-hill, for 12 varieties of Heaths, including the lovely E. propendens, a small but well-grown E. depressa, a large E. Massoni in fine health, and E. Coventryana, with small pink blossoms.—Of single specimens, Mr. Bruce obtained the first Prize for a beautiful plant of Aphelexis humilis, in profuse bloom. He was also awarded a large Silver Medal for the best 6 Specimen Plants, among which was Pentas carnea in good condition.—The 2d was awarded to G. F. Cox, Esq., of Stockwell, for a specimen of the beautiful Cattleya Mossiæ. Mr. Cox also obtained the 1st Prize for a collection of Orchidaceæ, in which was Vanda Roxburghi, the white variety of Gongora maculata, and a good Stanhopea oculata, having a fine spike of flowers.—The 2d was awarded to Mr. Schroder for Stanhopea insignis, Vanda cristata, and some others.—Mr. Wood contributed a collection of named Alpines. The display of Cut Flowers was particularly fine; the Roses were admirable. Among Amateurs, Mr. Seldon got the 1st Prize for Roses; the 2d was awarded to Mr. Edwards.—In Cut Flowers, Mr. Schroder was first.—Among Gentlemen's Gardeners, Mr. Bruce obtained the 1st Prize, and Mr. Parsons was 2d.—In the Nurserymen's Class, Messrs. Paul and Son got a large Silver Medal for Roses. The award for the best Cut Flowers was given to Mr. Chapman. Mr. Denyer's Prize to Amateurs for 12 trusses of Roses was awarded to Mr. Hunt and Mr. Parsons.

PELARGONIUMS:—*Amateurs:* The Gold Medal was awarded to Mr. Edmonds, for the following 6 varieties—Orange Boven, Comte de Paris, Priory Queen, Joan of Arc, Erectum, and Hebe. These specimens were admirably grown, the plants were in perfect health, and covered with bloom. In this class there was no competition.—Mr. Edmonds also received the Middle Silver Medal for the best 6 varieties of Calceolarias; the sorts were Lady of the Lake, Lady Constable, Competition, Glow-worm, Gazelle, and a seedling.—*Gentlemen's Gardeners:* Collections of 8 varieties: Large Silver Medal, Mr. Bourne, gr. to Sir E. Paget; this collection consisted of Sylph, Nymph, Matilda, Comte de Paris, Victory, Chelsea Pensioner, Diana and Erectum. Mid. Silv. Medal, Mr. Welch, gr. to—we could not learn whom—for Reward, Nymph, Victory, Joan of Arc, Lifeguardsman, Jubilee, Storey's Seedling, and Bridegroom.—*Nurserymen and Florists:* 12 varieties: 1st Prize, Gold Medal. This prize was awarded to Mr. Gaines, for 12 magnificent specimens, in perfect health, and covered with a profusion of bloom; the sorts were, Arabella, Priory Queen, Albina, Gem of the West, Lady Isabella Douglas, Mabel, Comte de Paris, Lady Cotton Shepherd, Erectum, Juba, Lifeguardsman, and Album perfectum. 2d Prize: the Large Silver Medal was obtained by Mr. Catleugh, for Nestor, Amulet, Madeline, Hannah, Lord Mayor, Duchess of Sutherland, Witch, Priory Queen, Comte de Paris, Hebe, and Maid of Honour. For PINKS, the 1st Prize (Small Silver Medal), was voted to Mr. Smith.—*Nurserymen:* The 1st Prize (Mid. Silv. Medal), was awarded to Mr. Norman, Bull's Field, Woolwich; and the collection from Mr. Henbrey, was recommended for a prize.

A splendid stand of RANUNCULUSES was exhibited by Messrs. Tyso and Son, to which the Middle Silver Medal was awarded; the sorts exhibited were the following—Marquess of Hertford, Kilgour's Princess Royal, Grandis, Romana, Temeraire, Tippoo Saib, Sabina, Queen Victoria, and the following seedlings, raised by Messrs. Tyso and Son—Imbert, Felix, Edgar, Dr. Horner, Virginia, Ximenes, Silverton, Comptroller, Delectus, Adolphus, Albinus, Boz, Basilica, Attractor, and a fine seedling not named.—1st Prize, Large Silver, Mr. Dawler, 12 varieties, in bunches.

A collection of FUCHSIAS from Mr. Robinson was recommended for a prize; and also another good collection from Mr. Pawsey, of Tulse Hill. Extra Prizes, offered by Mr. R. J. Chapman for the best and second best stand of 24 HEARTSEASE: 1st, Middle Silver Medal, Mr. Hunt; 2d, Small do., Mr. Edmonds.

PANSIES, in 24 varieties.—1st Prize, Mr. Edmonds; 2d Prize (Middle Silver), Mr. Hunt; 3d Prize (Small Silver), Mr. Bridges. Pansies, in 36 varieties, 1st Prize (Middle Silver Medal), to Mr. King, of Iver; 2d Prize (Small Silver), to Mr. Agate, of Croydon. Collections were also exhibited by Mr. Buxton, Wandsworth; Mr. Cook, Longwick; and Mr. Henbrey, of Croydon.

CALCEOLARIAS:—*Gentlemen's Gardeners:* Mr. Welch (Middle Silver Medal): this collection, which was well-grown, had no names attached. A collection of Mimuli, was exhibited by Mr. Wyness; many of the sorts having richly-coloured centres, were very handsome.—*Nurserymen:* Calceolarias in collections of 12 pots: 1st Prize, Mr. Gaines, whose collection consisted of Candidate, Mabel, Black Prince, Cyrus, Tigrina, Sultan, Aurea, Sunbeam, Attila, Lady Sale, Formosa, Queen.

SEEDLINGS:—A Prize was awarded to Mr. Henbery, of Croydon, for a pink named *Beauty*, a handsome variety, very beautifully and perfectly laced. A Prize was also awarded to Mr. Cook, of Longwick, for a Pansy named *Ariadne*, a handsome flower; and another variety named Prince Albert, was also recommended.

FRUITS AND VEGETABLES.—For the best collection of Fruits, Middle Silver Medal, Mr. Kay; 2, Mr. Atlee. For a basket of Black Hamburgh Grapes, Middle Silver Medal, Mr. Flicker. For the best collection of Vegetables, Middle Silver Medal, Mr. Martin; 2, Mr. J. Gaines. Mr. Cuthill produced good specimens of his Black spine Cucumber.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

May 17.—The Spring Meeting was held at the Experimental Garden, Inverleith; the day was unfortunately one of the most inclement of the season. For the four finest Shrubby Plants, the Silver Medal was voted to Mr. J. Young, gr. to T. Oliver, Esq., for Chorozema varium, Kennedya glabrata, Elichrysum elegans, and Boronia serrulata; 2, Mr. P. Crocket, gr. to Colonel Ferguson, for Pimelea decussata, Chorozema Henchmanni, Euphorbia splendens, and Franciscea Hopeana. For the finest Rhododendron, the Medal was awarded to Mr. P. Thomson, gr. to W. E. H. Vere, Esq., for R. splendidum var., richly clothed with flowers. For the two newest Fuchsias of merit, the medal was voted to Mr. J. Macdonald, gr. to Sir J. G. Craig, Bart., for F. Brookmannii and Eppsii; 2, Mr. Young, for F. Venus victrix and magnifica. For four Cape Heaths, the Medal was assigned to Mr. D. Foulis, gr. to J. Tytler, Esq., for Erica ventricosa alba, aristata, Beaumontia, and suaveolens; 2, Mr. G. Stirling, gr. to Lord Viscount Melville, for E. elegans, ovata, perspicua, and Willmoreana. The display of tender Herbaceous Exotics in pots was not great, the piercing east wind and violent hail showers having prevented gardeners from sending stove plants. An award was made to Mr. Young, for Amaryllis formosissima, Cineraria Youngii, Cineraria named Enchantress, and Tropæolum tricolorum. For Chinese Azaleas, the Medal was assigned to Mr. J. Reid, gr. to Professor Syme, for A. lateritia and variegata; 2, Mr. Crocket, for A. indica alba and Addisonii. For the best Tropæolum tricolorum, the Medal was awarded to Mr. W. Findlay, gr. to F. B. Douglas, Esq., for a specimen trained in the pillar form to the height of eight feet; 2, Mr. Reid, for one in the conical shape; and 3, Mr. R. Foulis, gr. to Admiral Sir P. C. H. Durham, for one trained in the halberd form. There was but a small display of stage Auriculas, the principal bloom being over. For one good collection, however, a premium was assigned to Mr. Thomson; the kinds being—of the white-edged, Sir William Wallace and Hugh's Pillar of Beauty; green-edged, Lord Nelson and Prince Blucher; gray-edged, Gain's Privateer and Chalcot's Brilliant. For two Cacti in flower, the Medal was awarded to Mr. John Macnaughten, gr. to J. Wauchope, Esq., for Cereus speciosissimus and Epiphyllum Jenkinsoni; 2, Mr. J. Gow, gr. to Count Flahault, for Epiphyllum speciosum and Jenkinsoni. An extra award was made to Mr. J. Thomson, gr to Dr. Neill, for Trichopilia tortilis and Dendrobium densiflorum. To Mr. J. Blair, gr. to the Earl of Rosslyn, an extra Medal was voted for an uncommonly rich series of flowers of Rhododendron, consisting of 30 distinct kinds, all of them beautiful, and several of them fine seedling hybrids of the damask sort, raised at Dysart Garden. Another extra Medal was voted to I. Anderson, Esq., for a choice collection of 30 new Seedling Calceolarias raised by himself, several of them of handsome shape and curiously marked, particularly those named Queen Victoria, Mrs. Syme, Sir Geo. Murray, Hon. Mrs. Peter Ramsay, Marquis of Bute, and Hon. Mrs. Norton. Messrs. Dickson and Co., Leith Walk, had likewise a Medal awarded to them, for an excellent collection of Calceolarias, including some fine Seedlings lately raised by them, particularly those marked Dickson's Sir Walter Scott and Competitor, Shanklie's Ne plus Ultra and Leith Walk Beauty, Richardson's Eclipse, and Scott's Gem. They sent for exhibition, also, several beautiful exotics, especially Ixora coccinea, Epacris grandiflora, and Tetranema mexicanum, with a selection of fine Cape Heaths in flower. Another extra medal was voted to Messrs. J. Dickson and Sons, Inverleith, for a fine collection of exotic plants, including a fine Seedling Fuchsia, called Edina, a noble specimen of Erica florida campanulata, and a remarkable Leschenaultia biloba, measuring about 5ft. in circumference around the branches, and covered with its azure flowers. An honorary award was made to Messrs. Cartstairs, Kelly, and Co., florists at Warriston, who exhibited a remarkably tall plant of Cereus speciosissimus in flower, with a beautiful Seedling Cineraria, marked C. Warristoniana. A large basket filled with flowering Alpine plants in pots attracted much attention, several of the plants being rare, such as Ajuga pyramidalis, Viola amœna, Galium græcum, &c. For this an extra award was made to Mr. Stirling, Melville Castle. A large box filled with succulent plants in pots, consisting of many genera and species, likewise excited a good deal of interest. It was from Corstorphine-hill garden; another extra premium for it was voted to Mr. J. Thomson, gr. to W. Keith, Esq. The display of Pansies, both named flowers and seedlings, was exceedingly rich. For a stand of 40 named Pansies, 20 being fine seedlings raised at Golden Acre, an award was made to Messrs. P. Lawson and Sons, as a mark of approbation. Mr. Alexander Forrester, gr. to Captain Falconar, of Carlowrie, sent cut specimens of a number of curious border flowers, a collection of Tulips, and a seedling Dodecatheon of merit, earlier and much larger than the ordinary sort, raised at Carlowrie, from a seed of the white variety; and for this last a premium was voted. A number of other articles were marked as sent for exhibition only. A specimen of Oncidium Papilio, from the hot-house of Mrs. Robert Haig, View Park, attracted the attention of every one, from its striking resemblance to a large butterfly or moth perched on the top of a wand, the flower-stem being long and without leaves. A specimen of Echium giganteum, 6 feet high, and exhibiting numerous gorgeous flower-spikes, and a new and fine stove plant, called Justicia carnea major, were from the Royal Botanic Garden, and much admired. Professor Dunbar sent, from Rose Park, a collection of the genera Erica and Epacris, and a fine plant in full bloom, of Camellia Gussonii; Sir J. W. Drummond, from Hawthornden, a general collection of green-house plants; Miss Broughton, from Rossend Castle, a splendid specimen of Epiphyllum Ackermanni; Thomas Oliver, Esq., from Newington Lodge, excellent collections of Tulips, Pansies, Anemones, and Pelargoniums; Messrs. Purdie and Merilees, Stanwell Lodge, beautiful Cape Heaths and Calceolarias; General Robertson, Canaan Bank, two admirably grown specimens of Calceolaria Standishii; James Adam, Esq., some very large double white Stocks. In the Hall were placed some very choice plants from the Society's own garden; particularly Statice macrophylla in flower, and a double-flowering variety of Ribes sanguineum, which bids fair to become a desirable acquisition to the shrubbery, the flowers coming later and continuing much longer in perfection.

The only culinary article exhibited this day consisted of remarkably large stalks of the Victoria Rhubarb, raised by Mr. David Carstairs, Leith Walk. To interest the agriculturist, there was a variety of Indian wheat in full ear, sent by Mr. Macnaughton from Edmonstone garden; the seed having been sown in a large pot in the greenhouse on 26th January, seedlings potted off on 26th February, planted out in the open border in March, and in flower early in May.

June 6.—This was the Florists' Flower Competition. Calceolarias, Pelargoniums, and Pansies, were particularly fine. On this occasion were offered two prizes of two guineas each, to be competed for by practical gardeners only—the one from Messrs. Dickson and Co., Leith Walk, for Calceolarias, and the other from Messrs. J. Dickson and Sons, Inverleith, for Pelargoniums. For the former, viz., the six finest varieties of Calceolaria, four competitors appeared; the prize was adjudged to Mr. J. Young, gr. to Mrs. H. N. Ferguson, of Archerfield, the kinds being named Duchess of Buccleuch, Prince of Wales, Hebe, Lady Constable, Yellow Craig, and Auldbattle; the last two were seedlings raised at Archerfield. In consequence of the near approach, in point of excellence, of another collection, sent by Mr. J. Young, gr. to T. Oliver, Esq., Newington Lodge, the committee thought it proper that an extra premium should be given for it, the flowers being Lady Constable, Standishii, Duchess of Buccleuch, Henrietta, Prince of Denmark, and Miss Mary Douglas, the last two being seedlings of 1843, raised at Newington Lodge.—For Pelargoniums there were likewise four competitors, all producing beautiful specimens. The principal prize was again found due to Mr. Young, Archerfield, the flowers being Grand Monarque, Fair Maid of Devon, Caroline, Florence, Flash, and Black Dwarf. Two of the other collections were so good that the committee deemed it proper to make extra awards for them—first, to Mr. A. Cossar, gr. to Lady Hay, for Constellation, Armyntor, Comte de Paris, Sapphire, Cleopatra, and Diana; and next, to Mr. P. Thomson, gr. to W. E. H. Vere, Esq., for Erectum, Flash, Queen of the Fairies, Fair Maid of Devon, Rising Sun, and Nymph.—For the prize offered for Pansies, six competitors came forward; but two very fine collections were set aside and excluded, on account of the regulations not having been properly complied with. The Silver Medal was awarded to A. Symington, Esq., for seedlings wholly of his own raising, and named as follows:—Mrs. Boyle, Miss Millar, Miss Thomson, Miss Patterson, Miss Hutchison, Jane, Miss Duncan, Miss Harriet Thomson, Miss Landale, Miss Skinner, Margaret, Anne, Miss Bankes, Agnes, Mrs. James M'Nab, Mrs. Mackenzie, Miss Taylor, Lord Morpeth, Miss Fraser, Marquess of Lansdowne, Miss Fleming, Miss Logan, Christina, and Miss Neill. The committee made two extra awards—one to Mr. J. Downie, gr. to General Robertson, and the other to Mr. J. Bulloch, gr. to Mrs. Crooks.—For Stocks, three red and three white, there were six competitors, forming together an admirable display of this fine flower. The Medal was voted to Mr. H. Gibb, gr. to Mrs. Stark; and a second premium to Mr. J. Lyall, gr. to Sir J. Hope, Bart.—For Rockets, the prize was assigned to Mr. Young, for French white, double purple, and double white.—For six hardy herbaceous perennial plants there were three competitors, and two premiums were given—the first to Mr. G. Stirling, gr. to Lord Viscount Melville, for Salvia lanata, Dracocephalum palmatum, Thermopsis fabacea, Anemone sulphurea, Lilium aurantiacum var. bulbiferum, and Lilium monadelphum; and the next to Mr. J. Addison, gr. to the Earl of Wemyss, for Lupinus grandiflorus, Dodecatheon Meadia elegans, and albiflorum, Czackia liliastrum, Aquilegia glandulosa, and Gladiolus byzantinus.—For tropical Orchidaceæ a Medal was voted to Mr. R. Haig; the plants were Stanhopea oculata, Oncidium flexuosum, and Oncidium papilio.—Extra awards were made to Mr. D. Christie, gr. to Col. Campbell, for producing small potted plants of Chrysanthemum sinense in full flower at this season of the year, the usual time of blooming being Nov.; and to Mr. Stirling, for exhibiting a large tray filled with exotic Alpines, and another with British Alpines, all the plants being in flower, and several of them of great beauty and extreme rarity in cultivation. Few vegetables were produced on this occasion.—A premium was voted to Mr. Addison, for fine samples of the Onion of Nocera, a new sort brought from the Continent last year by Mr. Lawson. It resembles the silver-skinned, is well flavoured, and excellently adapted for pickling; and it was mentioned by Mr. Addison, that while many Strasburgh and Portugal Onions, sown at the same time, in August, 1843, had now run to seed, not one of the Nocera Onion had done so. Another premium was given to Mr. A. Lauder, market gardener, for large heads of a new white Broccoli, remarkable for its lateness, and desirable for this quality, being thus calculated to supply the table till Cauliflower is common. Many plants and cut flowers were sent for exhibition only, both the pavilion on the lawn and the elegant new hall being completely filled. The most extensive contributors were the nurserymen and florists of Edinburgh, particularly Messrs. Dickson & Co., who, in addition to a fine show of Pelargoniums, Calceolarias, and Cape Heaths, produced a flowering specimen of Tropæolum edule, a kind of Indian Cress, lately introduced from Chili, having finely divided glaucous foliage and rather large orange blossoms; Messrs. J. Dickson and Sons made a similar fine display of Pelargoniums, Calceolarias, and Heaths, along with a specimen of Gloxinia (or Gesnera) tubiflora, four feet high; Messrs. Lawson, in addition to a choice collection of Pansies, sent a plant of Clerodendrum Kæmpferi, coming into flower; Messrs. Carstairs and Kelly, besides select Pelargoniums and Heaths, exhibited some admirably grown specimens of Saxifraga pyramidalis; and Messrs. T. and W. Handasyde, sent a choice collection of Pansies, and nine different species of herbaceous Irises in flower.—Exotic plants in pots were exhibited from the collections of Mr. Keith, Mr. Henderson, and Dr. Neill; and rare cut flowers from the garden of Captain Falconar.—Beautiful Tulips were shown by Mr. Hutchison and Mr. Gilmour.—A fine display of Calceolarias by Mr. Anderson, Maryfield, being hybrid varieties raised by himself, excited general admiration; and a rich collection of the same kind from Mr. Kinghorn, was also much admired, though unfortunately injured by carriage.—In the large tent a fine effect was produced by three noble Palm-trees waving their graceful fronds over the humbler plants and flowers. These were from the Royal Botanic Garden, and consisted of Phœnix dactylifera, or the Date Palm, and two specimens of Latania borbonica, from the Mauritius.—On this occasion twenty new members were added to the roll, among whom were G. W. Johnson, Esq., and M. Louis Van Houtte, of Ghent.

COUNTRY SHOWS.

Cambridge Horticultural Society, May 15.—This May Show was a very satisfactory one. The company was more numerous than at the May Show last year. The following prizes were awarded:—*Strawberries:* Mr. Cumming for Keen's Seedling, 5*s*. *Tulips*: 1, Mr. Ready for Duke of Bedford, Rubens, Triomphe Royal, Herome, and San Josef, 1*l*.; 2, Mr. Haylock for Triomphe Royal, Rose, Neptune, Polyphemus, Carlo Dolce, Washington, and Holmes' King, 10*s*.; 3, Mr. Catling for Washington, Duchess of Wellington, and Gloria mundi, 7*s*.; 4, Mr. F. B. Smith for Polyphemus, Triomphe Royal, and Rachel Rush, 5*s*. *Anemones:* Mr. Gimson for Princess Charlotte, Bramath Scarlet, Royal Queen, Queen Adelaide, Reine de France, and Grandissima, 3*s*. *Pelargoniums*: 1, Mr. Widnall for Widnall's Magnificent, Priory Queen, Effulgens, Joan d'Arc, Lord Mayor, and Flash, 1*l*.; 2, Messrs. Hudson for Hudson's Coronation, Splendidissima, Alicia, Joan d'Arc, Lowndes' Perfection, and Hudson's Sir Robert Peel, 10*s*. *Calceolarias*: Mr. Widnall for Widnall's Apollo, Golden Fleece, Campii, Homer, Plutus, and Vivid, 10*s*. *Pansies*, (cut): Mr. Widnall for Thompson's Regulator, ditto Azurea, ditto Fair Maid, ditto Malibran, ditto La Vallière, ditto Warrior, May's Imogene, Chater's White Defiance, Widnall's Excelsa, ditto Lepide, ditto Una, ditto Victor, and 12 seedlings, 10*s*. *Plant in a Pot:* Mr. Widnall for Erythrina cristagalli, 5*s*. *Ditto* (Amateurs): 1, Mr. F. B. Smith for Azalea indica alba, 5*s*.; 2, Mrs. R. Foster for Nerium splendens, 3*s*.; 3, Mr. Widnall for Cactus speciosissimus, C. speciosus, C. Scottii, Hoya carnosa, Deutzia scabra, Nierembergia intermedia, Clematis azurea grandiflora, Leschenaultia biloba, Gloxinia maxima alba, Phimbertia grandiflora, Manulea pedunculata, Cineraria imperial blue, Euphorbia splendens, Scutellaria splendens, Salvia patens, Calla æthiopica, Fuchsia fulgens superba, St. Clare, Formosa elegans, Pelargonium Gipsey, Siddonia, Garth's Victory, Calceolaria Royal Standard, and two seedlings, 1*l*.; 4, Mr. Ashton for Fuchsia multiflora, Eppsii, Achimeneflora, Venus Victrix, Arborea, Curtisii, Barclayana, Vallota purpurea, Pelargonium effulgens, and Miranda, 10*s*.; 5, Messrs. Hudson for Fuchsia Curtisii, Fuchsia corymbiflora, Sollya heterophylla, Calla æthiopica, Petunia alba. *Pelargoniums:* Masterpiece, Lanszerianum, Dennis's Perfection, and Alexandrina, 5*s*.; 6, Mrs. R. Foster for Hoya carnosa, Hydrangea hortensis, and Fuchsia fulgens, 5*s*. EXTRA PRIZES.—*Tulip:* Mr. Twitchett for Twitchett's Don John, 7*s*.; a fine feathered bizarre from seed of Polyphemus impregnated with Abercromby, and broke the first time of blooming. *Grapes:* Mr. Cumming for Black Hamburgh, 5*s*.—*Cambridge Chronicle.*

Cambridge Florists' Society, May 16.—This was the first Show for this season: Tulips, Pelargoniums, and Stocks constituted the principal feature of the exhibition. Notwithstanding the long-continued drought, the Tulips on the prize stands were better than might have been expected. The following prizes were awarded:—TULIPS.—*Flamed Bizarres*: Mr. Twitchett, Polyphemus, Osiris; Mr. Dickerson, Polyphemus; Mr. Haylock, Polyphemus; Mr. Ready, San Josef. *Flamed Byblomen:* Mr. Ready, Acapulca, Roi de Siam, Rubens, and Rachel; Mr. Twitchett, Acapulca; Mr. Catlin, Roi de Siam. *Flamed Rose:* Mr. Ready, Triomphe Royal, Rose Astonishing; Mr. Haylock, Triomphe Royal, Aglaia; Mr. Ready, Madame Catalani, Rose Camuze. *Feathered Bizarres:* Mr. Ready, Platonia; Mr. Haylock, Platonia; Mr. Twitchett, Royal Sovereign; Mr. Dickerson, Captain White; Mr. Twitchett, Platonia; Mr. Coulden, Vulcan. *Feathered Byblomen:* Mr. Ready, Lawrence's Friend; Mr. Catling, Violet Rougeâtre; Mr. Twitchett, Lawrence's Friend; Mr. F. B. Smith, Impératrice de Marocq; Mr. Twitchett, Friend; Mr. Ready, Washington. *Feathered Rose:* Mr. Twitchett, Reine des Roses; Mr. Ready, Heroine; Mr. Twitchett, Reine des Roses; Mr. Haylock, Heroine; Mr. Dickerson, Cerise Blanche; Mr. F. B. Smith, Rosa Blanca. PELARGONIUMS.—*Crimson and Scarlet:* Messrs. Hudson, Joan d'Arc, Splendidissimum. *White:* Messrs. Hudson, Alexandrina, Duchess of Gloucester. *Dark:* Messrs. Hudson, Seedling, Dennis's Perfection. *Rose and Pink:* Messrs. Hudson, Alicia, Victoria. *Plant in a pot*, Mr. F. B. Smith, *Azalea indica alba*; Mr. Green, *Kalmia latifolia.*—*Cambridge Chronicle.*

County of Durham Floral and Horticultural Society, May 21.—This was the first Show for this season. As a spring exhibition it was superior to any that has taken place since the establishment of the Society, both as regards the number and quality of the plants shown and the attendance of visitors. The following prizes were awarded:—*Pelargoniums*: Annette, Bridesmaid, Comte de Paris, Coronation, Jewess, Joan of Arc, Lord Mayor, Madeline Rienzer, Sylph, Vulcan, Victory, Mr. G. Lowrey, gr. to Mr. Fawcett; Specimen: Victory (10½ feet in circumference), Mr. F. Nichol, gr. to H. J. Spearman, Esq

Calceolarias: 1, Lady Constable, Standard, Landmark, Miss Antrobus, Knosthorpe Hero, Magna Charta, Nymph, Gazelle, Eclipse, Standish's Louis XIV., Mr. J. Wilson, gr. to H. J. Marshall, Esq.; 2, Knosthorpe Hero, Standish's Queen, Lady Constable, Elysium, Sir D. Wilkie, Mrs. Meynell, Ingram, Lady Prudhoe, Nun, Duke of Devonshire, Standish's No. 34, Mr. H. Mayor's No. 37, Messrs. Hancock and Son, Durham; Best 9: Lady Constable, Mrs. Meynell, Standard, Lowrey's Sophia, Knosthorpe Hero, Tam O'Shanter, Incomparable, Isabella, Dusty Miller, H. J. Marshall, Esq.; Best 6: Douglas, Lady Constable, Standard, and 3 seedlings, Mr. Lowrey; Best 1: Lady Constable, Mr. Nichol. *Fuchsias*: Tricolor, Venus Victrix, Moonshine, Mr. Lowrey. *Greenhouse Plants*: Pimelea hispida, Dillwynia glaberrima, Erica vestita rosea, E. vestita coccinea, E. ovata, E. echiiflora, E. ventricosa, E. mundula, Dillwynia clavata, Fabiana imbricata, Eutaxia pungens, Siphocampylus bicolor, Chorozema Dicksonii, Eutaxia (new sp.), Clematis azurea grandiflora, Clematis Sieboldii, Erica hybrida, Dillwynia speciosa, Boronia serrulata, Erica gnaphalodes, Messrs. Hancock and Son; 12 Greenhouse Plants: Pimelea decussata, P. spectabilis, Chorozema Dicksonii, C. Henchmannii, C. microphylla, Dillwynia speciosa, Eutaxia myrtifolia, Erica vestita coccinea, Erica quadriflora, Erica ventricosa superba, Anagallis Phillipii, Hardenbergia monophylla, Mr. Lowrey. *Cinerarias*: Queen of May, Pride of Peckham, Eclipse, Splendida, Triumph, Regina Victoria, Messrs. Hancock; Best 3: Enchantress, Challenger, Imperial Blue, Mr. Lowrey. An extra prize was awarded to Messrs. Hancock and Son for a Calceolaria named Isabella, Burchellia capensis, Hancock's Northern Beauty (Pelargonium), Cineraria Enchantress, Fuchsia speciosa, Anagallis Breweri, Calceolaria Midas, Cineraria Victoria, Pelargonium Vanguard, Calceolaria Prince of Wales, Arbutus new sp., Dillwynia, new sp., &c.

Devon and Cornwall Botanical and Horticultural Society, May, 30.—This was the Spring Exhibition. Many of the stands were filled with choice productions. Mr. F. Wood sent fine *Calceolarias*; among them were Andromache, Corymbiflora, Golden Fleece, Gaines's Bride, Incomparable, King, Lady of the Lake, Lady Constable, Lady Sale, Magician, Miss Antrobus, Purpurea grandiflora, Princess Royal, Royal Standard, Standishii. His Seedlings were as follow:—Tyrolean, Albion's Pride, Lady Bulkely Phillips, Lady Dickson, Clansman, Amina, Hon. Mrs. Murray, Inez de Castro, Kate Kearney, Countess Mt. Edgcumbe. Mr. Wood's *Petunias* were beautifully in flower; several of them were seedlings of his own. The collection of *Verbenas* comprised Barkerii, delicata, Edmondii, Emperor, Favourite, Formosa, grandis, Ingramii, Lilac, Perfection, Prince of Wales, Princess Royal, and Victory. Among Mr. Wood's *Fuchsias* were Brockmannii, Enchantress, Grand Monarch, Exoniensis, Transparens, Venus victrix, Grovellii, Lanei, and Toddiana. The group of Cinerarias comprised Agnes, Beauty, Bonny Lass, cærulea, Cleopatra, Clara, Comet, Coronet, Emily Moreland, Eclipse, Empress Josephine, Enchantress, Favourite, King of Russia, and Ovid. The *Pelargoniums* were in excellent condition, and among them we observed Acme of Perfection, Arabella, Bridegroom, Bridesmaid, Constellation, Conservative, Eros, Emily Moreland, Enchantress, Florence, Gem of the West, Great Western, Hawk's Eye, Ivanhoe, Joan of Arc, King of the Fairies, Lady of the Lake, Lady Peel, Sir David Milne, Macbeth, Nymph, Princess Maude, Royal Pet, Proserpine, Coronation. Mrs. Wells, of Exeter, sent a collection containing a beautiful Cattleya Mossiæ, with six flowers; very fine plants of Erica ventricosa, and Azalea variegata. *Orchidaceæ*.—Brassia maculata, Oncidium Carthaginense, the larger variety of O. ampliatum, O. papilio, O. divaricatum, Broughtonia sanguinea, Epidendrum fragrans, Lycaste Deppei, Vanda Roxburghi. *Stove Plants*—Quisqualis indica, Ardisia crenulata, Stanhopea grandiflora. *Greenhouse Plants*.—Gompholobium splendens, Leschenaultia formosa, Boronia viminea, Aphelexis humilis, A. sesamoides, Polygala speciosa major, Dillwynia speciosa, Pimelea hispida. *Ericas*—tricolor, very fine; ventricosa superba, vestita alba, mirabilis odorata, perspicua nana, jasminiflora, and intermedia. The contributions from Mr. W. E. Rendle were good. His Pelargoniums were excellent, including the following varieties:—Lyne's Duke of Cornwall, Sunrise, Cynthia, Hamlet, Lord Ebrington, and Modesty; Gaines's Rising Sun, Blackford's Thunderer and Jersey Maid, Foster's Conflagration, Constellation, and Favourite; Miller's Fascination, and Guide; Beck's Hebe, Sweet's Hermione, Cordelia, and Semiramis; Sir Robert Peel, Fair Maid of Devon, Beauty of Exe Vale, Princess Royal, Cornish Gem, Fanny, Queen of the Fairies, Grand Monarch, Van Amburgh, Enchantress, Camilla, Prince of Waterloo, Lady Villiers, Wilson's Aurora, Creole, Attila, &c. &c. He also sent a well-grown collection of Gloxinias, containing rosea alba, a very distinct variety; Pressleyi tubiflora, a white variety; rubra, maxima, picta, and candida; together with Gesnera Cooperi and zebrina, Euphorbia Bronnii and splendens, Centradenia rosea, Begonia floribunda, Franciscea Hopeana, Gardenia florida, Philibertia grandiflora, Achimenes longiflora and grandiflora, and Vinca rosea. His collection of Ericas comprised Beaumontii, Brandfordiana, carnea, coccinea, curviflora, cerinthoides, campanulata, cylindrica, fastigiata lutea, fulgida, gemmifera, gelida, Humeana, Hartnelli, hybrida, intermedia, mollis, mundula, ovata, propendens, rubra calyx, sulphurea, ventricosa superba, and Watkeni; together with a fine specimen of Paulownia imperialis.—*Plymouth Herald*.

Norfolk and Norwich Hort. Society, May 1.—This was the first Exhibition of fruits, flowers, and vegetables for this season. A fine specimen of Clematis Sieboldii, and a good Hardenbergia monophylla was sent from the garden of C. Middleton, Esq. A collection of plants contributed by J. Stacey, Esq., comprised Tropæolum tricolorum, Azalea indica alba in good condition, Euphorbia splendens, and Streptocarpus Rexii. A beautiful Rhododendron arboreum was exhibited by Mrs. Chitty. From Mrs. Backhouse was an Azalea indica alba, literally covered with flowers, and a fine specimen of Cytisus racemosus. A number of plants exhibited by Mr. J. Bell, not for competition, contained good specimens of Erica Hartnelli and ventricosa, E. tenuiflora, E. suaveolens, Fuchsia Britannia, Cineraria Eclipse, Medora, Cærulea, King of Prussia, splendens, and Calceolaria Sir Robert Sale, Magician, Zebrina and Barnes's King; Aphelexis humilis, Leschenaultia formosa, very fine specimen of Siphocampylus bicolor, Hovea Celsi, Azalea phœnicea and Smithii; Rhododendron Smithii and Verbena speciosa. PRIZES:—*Double White Camellia*, J. Rippingale, gr. to G. Morse, Esq.; *Azalea indica alba*, J. Allen, gr. to Mrs. Backhouse; *Rhododendron arboreum*, J. Boughton, gr. to Mrs. Chitty; *Clematis Sieboldii*, C. Middleton, Esq.; *Acacia juniperoides*, J. Rippingale; *Acacia armata*, J. Rippingale; *Gnidia simplex*, H. Browne, Esq., *Cactus truncatus*, R. Emms. *Muscat Grapes*, dried fruit, the Rev. C. Lucas. *Keen's Seedling Strawberries*, C. K. Thompson, Esq.; *Perring's Seedling do.*, Mr. J. Cockburn, gr. to J. T. Mott, Esq.; *Bath Scarlet do.*, C. Middleton, Esq. *Catillac Pears*, S. Short; *Uvedale St. Germain do.*, S. Short. *Dessert Apples*: Ribstone Pippin, Royal Russet, and Golden Pearmain, W. Scarlett, gr. to Mrs. Kett; *Sauce Apples*: Bedfordshire Foundling, S. Short; 2d do., Norfolk Beefin, W. Scarlett. *Cucumbers*: Suffolk Hero, R. Emms; 2d do. Windsor Prize Fighter, C. Alborough, gr. to G. S. Kett, Esq.; 3d do. Suffolk Hero, R. Emms. *Cobb Nuts*, Mrs. Gowing, Trowse. *Myatt's Victoria Rhubarb*, Rev. O. Mathias; 2d do., E. Kemp, gr. to J. S. Muskett, Esq. *Potatoes* Ash-leaf Kidney, J. Rippingale; 2d do. Prince Noble, W. Exelby. *Black-seeded Coss and Cabbage Lettuces*, R. Emms gr. to the Hon. and Rev. R. Wilson. *White Battersea Asparagus*, Mr. J. Warner, gr. to W. Robinson, Esq. *Seakale*, S. Short. *Broccoli* (Dale's), S. Short; 2d do. (Summer's late white), E. Kemp. *Imperial Cabbages*, E. Kemp. The Cottagers had about 10*l.* awarded as prizes, receiving from 1*s.* 6*d.* to 10*s.* each. Mr. Guymer received 7*s.* 6*d.* for a leash of beautiful Black Spine Cucumbers. The show was visited by upwards of 2000 persons.—*Norfolk Chronicle and Norwich Gazette*.

Stanford-hill Horticultural Society.—This was the first Show for this year. It was held on the 9th of May, in the grounds of J. Wilson, Esq. The display of plants, flowers, &c. was excellent; and, combined with the fineness of the weather, it afforded much gratification to the visitors. Many prizes were awarded; but as the Society is entirely composed of amateurs among the gentry of the neighbourhood, to the exclusion of all dealers or professional gardeners, I do not enter into any details. I may state, however, that it is the practice of this Society to offer prizes to Nurserymen (who compete with each other only) at each of their Shows.—*An Orig. Sub., Hackney*.

Surrey Horticultural and Floral Society.—This Society held their TULIP Show on Monday, May 20. The following is a list of the prizes awarded:—*Rose Tulips*: 1 and 2, Mr. Evans, Triomphe Royal; 3, Mr. Wakeling, Triomphe Royal; 4, Mr. Dickson, Ponceau très Blanc; 5, Mr. Evans, Fleur des Dames. *Bublomens*: 1, Mr. Wakeling, Siam; 2, Mr. Evans, Ely's Queen Victoria; 3, Mr. Wakeling, Rubens; 4, Mr. Evans, Holmes' King; 5, Mr. Dickson, Sir Edward Knatchbull. *Bizarres*: 1 and 2, Mr. Jackson, General Jackson and Gloria Mundi; 3 Mr. Wakeling, Sir Walter Scott; 4, Mr. Evans, Polyphemus; 5, Mr. Wakeling, Bolivar. *Pansies*, Yellow-ground: 1, Mr. Field, Thompson's Eclipse; 2 and 3, Mr. Downton, Satirist and Thompson's Regulator; 4, Mr. Buxton, Eclipse Superb; 5, Mr. Downton, Satirist. White-ground: 1, 2, and 3, Mr. Downton, Cotherstone, Lord Howe, and Blue Skin; 4, Mr. Pawsey, Miss Stainforth; 5, Mr. Plant, a seedling named Chieftain. *Light Selfs*: 1 and 2, Mr. Otley, Zelica; 3, Mr. Buxton, Imogene; 4, Mr. Heath, Imogene; 5, Mr. Field, Good's King of Yellows. *Dark Selfs*: 1, Mr. Downton, Black Bess; 2, Mr. Field, Pearson's Black Prince; 3, Mr. Edmonds, Black Bess. 3 *Seedling Self Pansies*: Mr. Downton, for Lucy Banks, Black-eyed Susan, and Emma. Mr. Otley's prizes for 24 dissimilar Blooms of *Pansies*: 1, Mr. Edmonds, Old Robin Gray, Satirist, Regulator, Jehu, Jewess, Rory O'More, Beauty, Princess Alice, Black Bess, Wallace, Blue-eyed Maid, Prince Albert, Curion, Firebrand, Exquisite, Yellow Perfection, Mulberry Superb, Ernest, Cyclops, Nymph, Herbert, Conservative, Miss Stainforth, and Sarah; 2, Mr. Field, Imogene, Regulator, Antagonist, Indian Chief, Exquisite, Mulberry superb, Grand Duke, Eclipse, Jehu, Black Bess, Rory O'More, Unique, Buxton's Knight, Maid of Lodi, Baroness, Warrior, Surprise, Delicata, Maid of Kent, King of Yellows, Eclipse superb, Trafalgar, Maria, and Attila; 3, Mr. Gittens, Satirist, Jehu, Unique, Attila, Rory O'More, Childe Harold, Black Bess, Eclipse, Delicata, Jewess, Mulberry superb, Imogene, Yellow Perfection, Regulator, Curion, Beauty, Exquisite, Miss Stainforth, Czar, Purple Perfection, Surprise, Sulphurea elegans, Julia, and Mazeppa. 3 Best *Greenhouse Plants*: Mr. Dawson, for Boronia serrulata, Kennedya, and Polygala cordata. *Pelargoniums*: 1, Mr. Roberts, Dido; 2 and 3, Mr. Jennings, Wood's Ivanhoe, and Gaines' King; 4 and 5, Mr. Roberts, a seedling not named, and Joan of Arc.

Torbay Horticultural Society, May 17.—This was the first Exhibition for the season. It was held in the grounds of Apsley House, Torbay. A handsome pavilion, 80 feet long by 35 wide, and 30 high, was erected for the purpose, and was well filled with plants from the neighbouring gardens, together with contributions from the Exeter, Plymouth, and Torbay nurseries. The Society numbered last year 100 members, with a total receipt of 144*l.* 11*s.* 2*d.*; the number of members is now 121, with a promise of increase in the funds. Prizes were awarded to all classes of Flowers, Fruits, and Vegetables, which, considering the excessive drought, were fine. The Prize *for the best Bouquet of Tender Plants grown in the open air* was awarded to Mrs. Johnes, of Park Hill. Among the specimens exhibited in this collection, and its competitors, were scarlet Pelargoniums, five varieties of Fuchsias, Mesembryanthemums, Petunias, &c., all in profuse bloom. As the thermometer only fell to 31° during the preceding winter, nearly every kind of greenhouse plant might have been grown in the open air. The Prize Medal for the *best Fuchsia*, was won by the Rev. G. M. Coleridge, with a fine showy plant of Richardsii, Exoniensis (not fully in flower), Gem, Pendula major, and others. The Pelargoniums, Heaths, Stove Plants, and other classes, comprised all the leading varieties. A Seedling Prize was awarded to the Rev. F. Belfield, for *Amaryllis transcendens marginata*, having all the good properties of *A. transcendens* with a distinct margin of pure white. The Seedling Medal, open to all England, for the best Pelargonium of 1844, was not awarded; a very beautiful specimen was exhibited, but was not superior to the old varieties of the same class.

Vale of Evesham Horticultural Society, May 22.—This Exhibition was the best that we have had. A fine display of Cacti attracted much attention. The stands were crowded with Tulips, which were in better condition than might have been expected, from the cold nights and scorching days we have lately had. Amongst the vegetables we noticed some fine Rhubarb, from the Rev. W. Digby, six stalks weighing 17 lbs. The following prizes were awarded:—TULIPS.—*Feathered Bizarre*: 1, Platoff, W. Barnes, Esq.; 2, Donzelli, F. Davies, Esq.; 3, Demetrius, Mr. R. Whitford. *Flamed*: 1, Polyphemus, Mr. R. Whitford; 2, Titian, F. Davies, Esq.; 3, Scipio, Mr. R. Whitford. *Feathered Bybloмen*: 1, Ambassadeur de Hollande, Mr. Clarke; 3, Premier Noble, Mr. R. Whitford. *Flamed*: 1, Lawrence's Friend, F. Davies, Esq.; 2, Couronne Violette, Mr. Clarke; 3, Washington, W. Barnes, Esq. *Feathered Rose*: 1 & 2, Walworth, Mr. R. Whitford; 3, Cerise la belle forme, F. Davies, Esq. *Flamed*: 1, Catalani, do.; 2, Rose Triumph Royal, do.; 3, Michael de Lisle, Mr. R. Whitford. *Yellow Self*: Mine d'Or, W. Barnes, Esq. *White*: Mountain of Snow: Mr. Whitford. *Stove or Greenhouse Plants*.—1, Cactus speciosissimus, Mrs. O. Cheek; 2, Erica ventricosa, E. Rudge, Esq.; 3, Epacris grandiflora, Mr. Pinnell. *Pelargoniums*.—1, Jehu, R. Ashwin, Esq.; 2, Foster's Alicia, A. Hartland, Esq.; 3, Splendidum, R. Ashwin, Esq.—*Berrow's Worcester Journal*.

York Horticultural Society, 22d May.—This was the second meeting this year. The following is a list of premiums awarded:—*Pelargoniums*: Messrs. Backhouse, for Alexandrina, Bridesmaid, Erectum, Lady Cottin Shepherd, Grampion, Masterpiece, Sylph, Coronation, Madeline, Wonder, Queen of the Fairies, Victory, &c. *Stove Plant*: 1, Messrs. Backhouse, for Angelonia grandiflora; 2, Mr. Appleby, for Gesnera splendens: 4, J. Roper, Esq., for Gloxinia hybrida; 5, Rev. D. Currer, for Erythrina Crista-galli. *Cacti*: 1, Rev. D. R. Currer, for Cactus Ackermanni; 2, the Lord Mayor, for Cactus Mallisonii; 3, Rev. W. Taylor, for Cactus Ackermanni; 4, Rev. D. R. Currer, for Cactus Jenkinsonii. *Orchidaceæ*: Messrs. Backhouse, for Oncidium ampliatum, O. Papilio, Cyrtochilum maculatum, and Gongora atropurpurea. *Climbers*: Mr. Edward, for Tropæolum tricolorum; 4, Mr. Appleby, for Zichya glabrata; 5, Jas. Richardson, Esq., for Sollya heterophylla. *Bulbous Plant*: 1, the Lord Mayor, for Amaryllis vittata; 2, Rev. D. R. Currer, for Pelargonium ardescens. *Greenhouse Plants*: 1, Mr. Appleby, for Pimelea spectabilis, and a well-grown Chorozema macrophyllum; 4, Messrs. Backhouse, for Diosma speciosa. *Spotted or Mottled Calceolarias*: 2, Lord Downe, for Lady Constable; 3, the Lord Mayor, for ditto; 4, Mr. Appleby, for Prince Albert; 5, Mr. Edward, for Fair Helen. *Blotched or Clouded*: 1, Lord Downe, for Catharine; 2, Messrs. Backhouse, for Green's Royal Blue; 4, Mr. Edward, for Splendida. *Self*: 1, Mr. Harrison, for Green's Standard; 2, Mr. Appleby, for Green's Denholmia; 4, Mr. Harrison, for Tam o' Shanter. *Fuchsias*: 1, Mr. Appleby, for Exoniensis; 2, Messrs. Backhouse, for Transparens, Venus Victrix, and Monypennii; 5, Mr. Appleby, for Tricolor. *Ericas*: 1, G. Swan, Esq., for E. hybrida, particularly fine; 3, the Lord Mayor, for E. hybrida coccinea; 4, Messrs. Backhouse, for E. mundula and vestita alba. *Rose in Pot*: 1, Col. Thompson, for Prince Albert. *Azaleas*: 1, Mr. Appleby, for Woodsii; 2, the Lord Mayor, for Variegata; 3, Mr. Appleby, for Indica alba. *Epacris or Corræa*: Mr. Appleby, for E. pulchella; Messrs. Backhouse for E. Craigii. *Hardy Herbaceous Plant*: 1, Mr. Appleby, for Euthales macrophylla; 2, Messrs. Backhouse, for Campanula grandis; 3, Mr. Harrison, for the same. *Rhododendron*: J. Roper, Esq., for Multimaculatum. EXTRA PRIZES.—*Cinerarias*: Mr. Appleby, for Pride of Peckham, Van Amburgh, and Enchantress. *Hardy Shrub*: Messrs. Backhouse for Fabiana imbricata.

Reviews.

Transactions of the Horticultural Society. Vol. 3. Part I. New Series. 4to.

THIS Number of the "Society's Transactions" contains the commencement of Mr. Hartweg's Journal, extracted by us at p. 134, a plate of the beautiful Habrothamnus fasciculatus, and several papers of considerable interest. A long and very important report, by Mr. E. Solly, upon his experiments in the Society's Garden, occupies above 60 pages. For the general facts elicited by them, we must refer to the ample and elaborate tables in the report itself. We can only extract a few passages.

Speaking of experiments with Potatoes, Mr. Solly calls attention to the remarkable fact, that the presence of nitric acid in the crop bore no apparent relation to the manures employed. In one case, although nitrate of soda was employed, no nitric acid could be found; and yet this compound made its appearance when the sulphates of soda and magnesia were alone employed. Upon this the following remark is made:—

"The fact that some of these plants contained salts of nitric acid, whilst others did not, is very remarkable, and of especial interest in connexion with the action of the nitrates as manure. Professor Liebig says, in his 'Chemistry in its Applications to Agriculture,' &c. (3d edit. p. 233,) 'The presence of a nitrate in plants permits only one conclusion—that the nitrogen of nitric acid is not employed in their organism for the formation of compounds containing that element, because, if it were, at a certain period of the life of the plant, it would disappear on account of this conversion.' The existence of nitrates in a plant cannot, as it appears to me, be considered as any evidence that the nitrate does not supply nitrogen to the plant. It might in the same way be argued, that ammonia does not supply nitrogen to plants, because it is very constantly found in them. With regard to the disappearance of the nitric acid at a certain period of the life of the plant, it is desirable to have experimental evidence; I have found in several cases that the proportion of nitric acid in plants was great when they were young, and gradually diminished as they grew older. I have already adverted to the curious fact that when plants were manured with nitrates they grew very vigorously, but were not found on examination to contain any nitric acid."

Some attempts have been made to ascertain whether Chemistry can explain the difference in the quality of the same sort of timber grown in different soils. This examination is one requiring many experiments, and necessarily occupying a very long time. The following experiments, however, have been made by Mr. Solly:—

"A large collection of samples of wood from different localities, grown in various situations, and under various conditions, has been made; amongst these was a series of specimens of Oak-wood, for which I am indebted to Sir William Symonds, and which in addition to their being from different parts of the world, were all of known quality, each sample being marked with a note of its quality deduced from actual experience. It is to be regretted that the majority of them were bad or inferior, even those from localities whence the very best wood is usually imported, hence, of course, they cannot be regarded as average samples but rather as exceptions. The proportion of earthy matter which they contained, together with their locality and relative goodness, is contained in the following table:—

Oak Wood from	Quality.	Organic matter.	Water.	Inorganic matter.	Inorganic in 10,000 parts dry.
America (white)	bad	9188	773	39	42
Do. (live Oak)	good	9306	621	73	78
Do. do. "Gibraltar"	good	8615	1111	274	308
Crimea	tolerable	8909	1026	65	73
Canada	bad	8845	1132	23	27
Circassia	indifferent	9125	841	34	37
Danzig	tolerable for plank	8949	1037	24	27
England (mean of 10)	various	8888	1097	15	18
East Prussia	indifferent	9143	832	25	28
France	bad	8892	1092	16	19
Farnia (Tuscany)	bad	9234	722	44	52
Hainault	bad	8728	1258	14	16
Istria	bad	9011	923	66	73
Poland	indifferent	9059	924	17	18
Podolia	bad	8950	1019	31	35
Russia	bad	9013	977	10	11
Styria	indifferent and light	8985	997	18	20
Sardinia	good	8969	1003	28	32
Tuscany	good	8899	917	184	202
Ischia	good for plank	9025	957	18	20

"The larger proportion of earthy matters in the Oak of southern countries is remarkable as contrasted with the smaller quantity found in English Oak, and the Oak of northern countries generally. Still from this table no general conclusion can be drawn as to the relation between the inorganic substances and the quality of the wood."

Among the agents concerning whose utility in cultivation hopes may be reasonably entertained, are the salts of muriatic acid. The latter is proved to be of itself a very powerful and valuable promoter of growth, when employed in very small quantity, and the effect of muriate of soda or common salt is well known. Hence Mr. Solly's attention was turned to the consideration of the muriates, and among others of muriate of lime.

"In nearly all the experiments which have been made at the Gardens," he observes, "marked effects have been produced by manures containing muriatic acid; hence it was reasonable to conclude beforehand that the muriate of lime would prove a good manure. Other considerations gave it a still higher interest; from previous experiments it had been ascertained that a very small quantity of muriate of lime in a soil, exerted, in consequence of its hygrometric properties, powerful influence on the retentive power of the soil for moisture. It was, however, apprehended that the presence of any quantity of the salt, even though small, might prove injurious to vegetation. The experiments above described show that this is not the case; the quantity employed was considerable, and so far from doing any harm, it on the contrary produced a very excellent effect. The experiments on the hygrometric powers of soils just referred to, were part of an extensive series, undertaken with a view of ascertaining what influence saline manures exert on the retention of moisture. Weighed quantities of natural and artificial soils of various natures were moistened, some with pure water, and others with water holding in solution minute quantities of different saline substances; the soils were carefully weighed from day to day, and the daily loss of water, subtracted from the original quantity of moisture which the soils contained, showed the relative retentive power of the soil under examination. The following short table shows the result of one of those experiments in which 25 portions of fine siliceous sand weighing 2000 grains each, were each moistened with 500 grains of pure water, and weighed every day. To the first five portions nothing but the water was added, the next five received in addition one grain of muriate of lime, the next five two grains of that salt, the next five, five grains, and the remainder ten grains of the muriate. The mean of each five weighings alone is given; the numbers show the weight of water retained by each portion during the experiment:—

	Water only.	1 Grain Muriate of Lime.	2 Grains Muriate of Lime.	5 Grains Muriate of Lime.	10 Grains Muriate of Lime.
1st Day .	500	500	500	500	500
2d do. .	444	449	453	457	463
3d do. .	392	403	408	412	416
4th do. .	322	344	352	356	361
5th do. .	266	293	305	312	317
6th do. .	230	261	273	280	286
7th do. .	188	223	236	243	249
8th do. .	132	176	189	197	206
9th do. .	80	129	145	154	163
10th do. .	50	93	110	121	134
11th do. .	26	68	85	98	114
12th do. .	13	40	57	71	90
13th do. .	8	26	40	56	77
14th do. .	2	14	25	39	60
15th do. .	2	9	18	31	52
16th do. .	2	5	12	24	44

Hence it appears that while soil in its ordinary condition had lost in 16 days nearly all its water, that in which 10 grains, or a 200th part of muriate of lime had been mixed, retained nearly a tenth of the water; a most important consideration in a practical point of view, considering the cheapness of the material and the disastrous effects of drought.

Another paper consists of notes by Dr. Lindley, upon the Rate of Growth by Plants, at Different Periods of the Day. In this paper the object was to ascertain the degree in which vegetation is affected by light and darkness in the rate of growth. We must suppose that the development of a plant under the influence of a bright sun, or in a damp and clouded atmosphere, in a cool night, or in a chilly morning before sunrise, will be materially dissimilar. But it is in very few cases that physiologists have turned their attention to such variations, and because the operations of the forcing gardener are much connected with the inquiry, a series of observations upon the subject was made four times daily, in the garden of the Society, by Mr. James Donald, during the months of March and April, 1843. The plants selected for experiment were a Sweet Willow, a Fig, the Onyx Passionflower, and a Vine. The plants were fastened as they grew, to a lath, on which the amount of lengthening was marked off four times a day, viz., at 6 a.m.; noon; 6 p.m.; and 11 p.m.; and the detail of the observations is given in a tabular form. We can only find room for some of the results. After stating that in some respects the observations confirm the prevailing opinion that plants grow fastest in warm, cloudy weather, and slowest in clear, bright weather, the author remarks as follows:—"But if the experiments were to a certain degree to confirm the general opinion that plants grow fastest in warm cloudy weather, it is also clear that they indicate the presence of other agencies than light and heat, and a regular supply of moisture. The numerous exceptions that are found even in those plants which in rapid growth conform the best to the supposed rule show this sufficiently well, and when we attempt to reduce to it the slowest growths we fail entirely; the facts inclining sometimes one way and sometimes the other. One of the most singular facts brought out by these observations is the total want of correspondence between the effects produced upon plants by the same external circumstances. The subjects of experiment were placed within a few feet of each other, in a house heated very uniformly, and equally exposed to light, and to every other agent by which it is conceivable that plants should be affected. Yet, strange to say, it appears certain that the same causes do not produce the same results, when operating upon plants of different species. For example, the greatest growth made by the Sweet Willow was on the 7th of March, when the noon-day observation gave .56; at that hour the growth of the Fig had been only .08, and of the Passionflower .24, which was about the average; and of the Vine only .42, which was slightly above it. The greatest growth of the Passionflower was on the 14th of April, when the 6 p.m. observation gave .82, which was .42 above the average; on the same day the Willow had grown .36, or .20 above the average; the Fig .09, or about the average; and the Vine, .14 or ·24 *below the average!* Upon the whole, then, it seems that we must regard the growth of plants as a far more complicated problem than is generally supposed. The evidence that has been produced appears to show that there is a regular oscillation of growth during the 24 hours, that the principal development takes place in the afternoon (between noon and 6 in the evening), and follows the smallest, which occurs in the forenoon (between 6 in the morning and noon); and that this oscillation is not connected with light and temperature, because the growth in the forenoon is less than in the morning (11 p.m. to 6 a.m.), when the temperature is at its lowest; it may also be inferred that thin-skinned plants grow fastest in the absence of bright light, and possibly that thick-skinned plants obey an opposite law. But it does not appear satisfactorily that the varying rates of elongation are, under the circumstances of the experiments now detailed, dependent, to any considerable extent, upon fluctuations of temperature, light, or moisture. On the contrary, it seems almost certain that some other powerful agent is in operation, the nature of which we have at present no means of ascertaining.

Miscellaneous.

Guano.—The top and sides of the Morro de Arica, on the Coast of Peru, appeared, as we had already seen them from the open sea, of a white colour; but we had been mistaken in supposing that such was the colour of the rock. This white coating is the celebrated fowls' dung, the guano of the Peruvians, which has excited so much attention in recent times.* Along almost the whole coast of South Peru this excrementitious matter covers the small islands and cliffs near to the coast; and on some spots lies in such enormous beds as could only be produced by the accumulation of thousands of years. It is derived from the immense multitudes of the larger sea-fowls which inhabit this coast, and which belong chiefly to the genera of Pelicans, Cormorants, and Gulls. Their number is legion, for, in the true sense of the word, they eclipse the sun when, early in the morning they take flight from their resting places, in flocks that are miles in length. One must have seen them in order to form an adequate idea of their numbers; and then it becomes conceivable how in particular places such vast masses of this manure are yearly dug up. Mr. Rivero estimates that the islands Ilay and Jesus alone yielded annually 500 fanegas of this fresh birds'-dung. The guano is an article of commerce of great importance, particularly as, in the southern maritime provinces of Peru, where a great want of water prevails, the soil is very sandy, and requires to be manured previously to being tilled. The extraordinary fertility which birds'-dung, with sufficient irrigation, imparts to the soil, is equally well known to our countrymen in Europe: in Peru the produce of the fields is doubled by it. According to the age, and perhaps also according to the different kinds of fowl that yield it, the guano is found of different colours and quality; so that it has been divided into three distinct varieties, namely, the red (Guano rojo), the brown (G. perduzco), and the white (G. blanco); which also bring different prices. The red and brown kinds sell at 1¼ dollars the fanega (2½ quintals), while the fresh white fetches 2 dollars, and in time of war still higher prices. ..... The birds which yield the Peruvian guano are known by the general name of Huanacs.—*Meyen's Reise um die Welt*, vol. i. p. 434-5.

* It is worthy of note that the guano was known to Horrera. In Dec. V., lib. iv., cap. 9, he says, "En algunas Islas de la costa del Perú se ven unos cerros blancos, qui parecen de nieve, y son montanos de estiercol de Pajaros marinos, que van alli a estercolar, y alli van los Rancos a cargar de ello, para estercolar la tierra, de que sienten gran provechoete."

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—HOTHOUSE, CONSERVATORIES, &c.

This is about the best time to get any necessary repairs, or painting, &c. done in the stoves, as the greater portion of the plants may be safely removed into other houses; indeed all plant-houses ought to have a slight coat of paint annually. Any moveable sashes may be done from the outside, by turning them on purpose. The lights of pits and frames at work may be painted any time in dry weather, by turning them in the same way. Many of the soft-wooded stove plants flower best while they are young; and about the end of June is a good time to propagate these for flowering next year.

Conservatory.—Common Pelargoniums are now being struck from cuttings in the open ground round London in multitudes; the old plants might also be shaken out of their pots, and planted in the open ground, to be taken up early in the autumn, so as to get well established in the pots before winter; they would make excellent plants for forcing next spring; the midsummer cuttings will make strong plants by next October; and if they are well encouraged early in the spring, they will make beautiful flowering plants this time next year. All the best varieties of the Chinese Primrose should now be divided and planted out in a shady situation in very rotten leaf-mould, to be taken up next September for winter flowering. Seedlings of them should also be planted out now in spare pits, well shaded, there to remain till they all flower, when the inferior sorts may be thrown away.

Greenhouse.—All the best specimen plants are still to be kept in-doors, but the paths are flooded over every evening to keep the plants in a moist atmosphere; and where a portion of the hardier stove plants are introduced among them, the doors and ventilators had better be shut up late in the evenings.

Pits.—Prepare to make a large plantation of your choice dwarf and young plants in these useful structures, turned out of the pots for two or three months in suitable composts. One who has not seen the good effects of this plan can hardly conceive the improvement it makes in the plants, particularly on Heaths, Epacrises, and other delicate plants, which are difficult to manage in dry hot seasons under the ordinary pot culture.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

The directions of last week, I am sorry to say, are still applicable in this part of the country; for though I can hear of heavy rains in various parts, it is by no means a general thing at present. This dull weather is, however, all in our favour, and my plants, which have been well watered, have grown more within the last ten days than they had previously in treble the time. I have heard of great success having attended the application of concentrated manures to bedded out plants this season; but as the same cause which has kept them growing through this dry weather will start them to growth instead of flower, perhaps those who may now have strong plants will find a great scarcity of bloom in the autumn. I therefore do not feel warranted to recommend the use of such stimulants, except on very poor soils, until by experiment I have satisfied myself of the advantages of their application.

Chrysanthemums which have been planted out and are now becoming tall, may have their branches regularly pegged out so as to get the tips turned up preparatory to their being layered towards the end of next month.—*W. P. A.*

III.—FLORISTS' FLOWERS

Auriculas.—Continue to prick out seedlings, in pans or boxes, shading them from the sun. *Polyanthuses*, if we continue to have showers, may be parted to advantage now, renewing the bed with decayed cow-manure, and leaf-soil. some growers shorten the leaves; it is most advisable not to do so. *Tulips.*—The general collection may now be taken up, provided the foliage has assumed a yellow hue; shake the soil clean from the roots, but do not yet remove the fibres or outer skin from the bulbs; place them in their respective compartments in the boxes, or wrap them in very thin paper, called "Cap-paper," writing the name on each. *Ranunculuses.*—The late drought has been seriously against these beautiful flowers. Any roots, the foliage of which has begun to decay, must immediately be taken up; as rainy weather will cause them to "start" again, to the almost certain destruction of the root. In sunny weather, dust the capsules of your favourite flowers, which you may be anxious to seed, with farina of the best formed semidoubles you can obtain. *Carnations.*—Follow the directions given last week, pinching off the laterals, disbudding, tying, keeping free from Aphis (if possible,, &c. &c. Put in pipings, as recommended for the pink, marking each lot of cuttings, so that when the layers bloom from which they were taken, if they should chance to be "run," or full of colour, the pipings from such foul flowers may be destroyed. *Dahlias.*—Carefully stake, tie, &c. &c.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—If the bottom heat where the plants are swelling their fruit fall below 85°, the readiest way of renewing it will be to lay a few inches of fresh tan on the surface, should the pots be already plunged to the rim, the new tan may be laid over the surface of the soil, without detriment, if not with positively good effects to the plant, as it helps to keep the soil in a uniform state of moisture, which is a great desideratum in the culture of this plant, as well as of all others. Where the young stock is grown in pits heated on the tank system, and tan is consequently used merely as a material for plunging, I recommend the practice of covering the rims of the pots to the depth of two inches, as also recommended in Mr. Hamilton's "Treatise." I have practised this method, and find it beneficial to the plants, and also a saving of labour, as watering is almost dispensed with, excepting what the plants receive by being well syringed every evening.

Vineries.—Let the houses where the fruit has been cut have plenty of air, and keep the Vines free from insects. Those Vines now ripening their crop will require the temperature to be kept well up during the day, with abundant ventilation at the top of the house. No fire need be made at night, but the atmosphere must be kept dry. Attend to the watering of the Vines planted inside the border. In removing the litter from the roots, take care to leave some of the shortest as a mulching, and if the border appears at all dry, give a copious watering.

Peach-houses.—Continue the treatment recommended for the last few weeks.

Fig-house.—The plants in pots will now have their second crop advancing to maturity, if they have been treated as recommended in the Calendar for April 20th. Let them have regular supplies of water as they may require it, and avoid wetting the fruit.

Melons.—We find it difficult to keep Melon plants in pits heated by hot water free from red spider this season; nothing but constant watching for its appearance, and applying immediately the usual remedies, will keep this pest in check We wash the walls and pipes once a fortnight with whitewash, in a pailful of which half-a-pound of sulphur has been stirred. Persian Melons require a very dry and warm atmosphere to grow in, with abundance of moisture at the lower part of the soil. This we supply to them by means of earthen pipes placed perpendicularly in the soil at intervals of five or six feet. Into these water is poured once a week; and to keep the atmosphere dry, the apertures of these pipes are covered with tiles in damp weather.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

Last night we had at last a beautiful rain. Every one who has had the same privilege will be busy planting, sowing, thinning, &c. As soon as convenient let the surface of the ground be well stirred with the rake or hoe, to prevent the moisture evaporating. The late very dry weather will have forced several things upon the consideration of many; such as the importance of so choosing the site of a garden as to have a plentiful supply of water; the construction of tanks in gardens short of a supply, to receive the water from drainage, hothouses, frames, &c. It is an ascertained fact, that in general as much rain falls on a dwelling-house as will supply the inmates during the season. Why should such a fact not be made available in gardens? In most pit and frame grounds much valuable matter is lost every heavy rain, which would be of great service for summer crops. The past season will likewise have demonstrated the utter inefficiency of surface-watering, the importance of keeping the surface of the soil loose and often moved, and the great advantage of digging or trenching deep for all the main crops. On ground thus treated I have never seen Peas, Potatoes, &c. look better, though they have had no assistance from the watering-pot. *Routine.*—Attend to fruit-trees, peg down the shoots of Cucumbers and Vegetable Marrow under hand-lights, brush and roll the walks and make every place clean and tidy.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Attend to previous directions, but take care that the persons employed really understand the principles of their work.

Coppice.—The same attention is required in this department; prune, train, and regulate the young shoots from the stools; do not allow them to get injured by being too much crowded.

Young Plantations.—Prune and train the young plants, as by this practice several seasons' growth will be gained. Instead of thinning out when the trees are young, much more good may be effected by shortening the side branches next the permanent trees, and occasionally those of the trees also, in order to keep them in proper form.

Hedge-rows.—The plants in these will require attention occasionally.

Nursery Work.—Watering and shading the transplanted seedlings and other things are still requisite. We have had no rain where I reside yet, except passing showers, which are barely sufficient to lay the dust.—*W. B.*

State of the Weather near London for the week ending June 20, 1844, as observed at the Horticultural Garden, Chiswick.

June		Moon's Age.	Barometer. Max.	Min.	Thermometer. Max.	Min.	Mean.	Wind.	Rain.

The highest temperature during the above period occurred on the 28th, 1836—therm. 91°; and the lowest on the 28th, 1843—therm. 40°.

Notices to Correspondents.

We have again to announce that Mr. PAXTON'S COTTAGERS' CALENDAR is out of print. We have given instructions for a new edition to be prepared immediately, and shall feel obliged if those gentlemen who propose distributing copies amongst their tenantry will at once order them, that we may judge how many to reprint.

AGRIMONY.—*(Economica.*—This is a perennial, and may be propagated by seeds or roots. How much one person may consume we cannot tell. Its leaves are to be gathered when full grown, and before they change colour. If the plant is not allowed to flower they will be finer. They should be dried in the shade like Chamomile flowers, and when quite dry be inclosed in tin canisters. They are aromatic and tonic. Both Hawthorn leaves and Sloe leaves are astringent. There is no harm in them when dried, nor any good that we know of.

BOOKS.—*F. W. C.*—The last edition of "Sweet's Hortus Britannicus" was published, we believe, in 1839 ——*A Subscriber.*—"Hamilton on the Pine," "Roberts on the Vine," "Sweet's Hothouse and Greenhouse Companion."

CAMELLIAS.—*T. G. H.*—These may be inarched in June; but care should be taken not to keep the plants close and warm, if you wish them to flower the first spring, as they are apt to make a second growth. If worked in June or July, and kept slightly shaded, they will be fit to be separated from the parent plant before the rest of your plants are housed.‡——*A Subscriber.*—As soon as the present year's shoots are ripe, take cuttings off, with a heel, and put them into pots prepared in the usual way for cuttings. They should be placed in a cool frame, or under hand-glasses, and kept shaded until they have commenced forming roots, when they may be removed into a brisk bottom-heat. Shoots of the middle size make the best cuttings.‡

CAPE BULBS.—*A Reader.*—Your large bulb from the Cape is, we presume, Brunsvigia Josephinæ. It should be planted in well drained pots in light loam with the bulbs half way above the soil. They should be watered sparingly until roots are formed; but when they begin to grow, water may be more freely supplied. In autumn they may be placed in a light situation in a cool greenhouse, where they may remain until spring. During this period they should receive only a moderate supply of water. About the beginning of May they should be placed in a stove where they may be kept warm through the summer, and in August or beginning of September the flower-buds will appear and rise rapidly. The Elephant's Foot is Testudinaria elephantipes.‡

CLIMBING PLANTS.—*A. M.*—The following is a good selection: Clematis azurea, Sieboldi, and montana; Glycine sinensis, Solanum crispum, Chimonanthus grandiflorus, Jasminum revolutum, Ceanothus azureus, Magnolia conspicua and grandiflora, Berberis fascicularis, Passiflora cærulea, Bignonia radicans major, Caprifolium flexuosum, Eccremocarpus scaber, Cobæa stipularis.¶

CONSERVATORIES.—*A Subscriber.*—Your plan looks well; but you are losing too much room. Better connect the stages at the back wall; otherwise you will have only 4 feet, out of 15, for plants. Your borders, moreover, ought to be at least 3 feet wide, if bushes are to grow in them. Freestone is better for stages than wood.

COTTAGE GARDENS.—*R. H.*—We are much obliged for your note. Perhaps we have been remiss. We will endeavour to do better. Such hints as yours are always most welcome.

ELDER FLOWERS.—*J. McL.*—If these are dried very slowly, in the shade, and without heating, they will retain a part of their fragrance: but a great deal of it will disappear. They ought to be put into the still when fresh gathered.

GARDEN WALLS.—*A Norice.*—A garden-wall will face the sun at 1 P.M., if you build it at right angles to a line corresponding with 1½ point of the compass from your meridian, or N. by E. ½ E. If you are in doubt about the correction for the variation of the compass, you may consult your watch, putting yourself in a line with the sun, and a stake fixed in the ground, at the hour required, having first corrected your watch to the time of the sun's coming to the meridian, on the 20th of August; and surely this will be sufficiently accurate for all Horticultural purposes.‡

GRASSES.—*R. G.*—The most valuable of all Grasses for growing under trees is Dactylis glomerata. For *Aisa* Cæspitosa, p. 392, read Aira C., but it is perfectly worthless—scarcely a creature will touch it; but we have the authority of Messrs. Lawson, transmitted, we apprehend, from some German experimenters, that Aira lutea, which has the same habitats as A. Cæspitosa, is a good Grass, with Anthoxanthum odoratum. Melica uniflora, (a very elegant Grass), Melica Sylvestris, Festuca Sylvestris, Bromus Sylvestris, Arundo Epigeios, and Bromus giganteus, also grow in woods under trees. The versatile character of Lotus corniculatus, which usually frequents only the sunniest downs, is one which has not been generally observed.—*W. P. Taunton.*

GREENHOUSE VINERIES.—*Omeo.*—The points to attend to in growing plants in vineries are the following:—1. To train the Vines to the rafters, or otherwise, so that they shall not overshadow the interior before the end of May. 2. To empty the house of all greenhouse plants after that period, and to take every possible pains to get the wood ripe. You cannot have Grapes without well-ripened wood. If Vines are very late in growing, they will require fire-heat in autumn, in order to ripen their wood, in many seasons. Vines and greenhouse plants do not agree very well; but under such a system they may be kept from quarrelling much.

HOLLY HEDGES.—*G. B. S.*—If your hedge were ours we should cut it down in the beginning of March to within two feet of the ground. It would spring up again, and would soon form an impervious barrier. Or if you like, cut the plants down to two feet and four feet alternately. If, after having done this, you shorten the shoots back a little every year, and never allow the bottom to be choked with weeds, a beautiful thick hedge will soon be regained.

HEATING.—*Aliquis.*—It will not do to use *open* gutters for bottom-heat. Whether you employ tanks or gutters they must be covered by something; and a porous material, like soft burnt flue tiles, is found the best. Wood will soon rot when buried in the ground; it is better to use bricks or slate. You must not rely upon your bottom-heat for winter purposes; at that time you want dry air heat for a greenhouse, and must have iron pipes to supply it. If E D is 12 feet, let A E be 6½ feet, C D 10 feet, and F B any height you please.

HEIGHT OF TREES.—*A Subscriber.*—An easy method of finding the height of trees is as follows:—Being provided with a level which is furnished with a vertical arch, take a station as far distant from the tree as its apparent height from the ground, and as nearly as possible on a level with its root. Having placed the instrument level, and upon looking through the sights, make a mark on the tree in a line with the cross wire in the sight of the level. Then raising the moveable part of the level to the angle of 45° fix it there. Looking through the sights, observe if they are in a line with the top of the tree, and if they are not, move the instrument backwards or forwards until the top is seen through them, still, however, keeping the instrument on the same horizontal plane with the first station. The distance from the instrument to the tree is its height from the mark first observed upwards; to this add the height from the ground to the mark, and the sum is the entire height of the tree.‡

INSECTS.—*C. F.*—Your little Spiders are the young of Aranea diadema, which live entirely upon flies and other insects, and when first hatched are gregarious. *R.*——*Este.*—The galls on your Elm-leaves are filled with an Aphis, but unless we had more matured and winged specimens, we cannot name the species. *R.*——*W. R.*—If your Thrips be the tropical species, no heat will destroy it, and if the evaporation be great, fumigation will not be successful. We cannot recommend anything more effectual than fumigating with sulphur for twenty minutes, but the external air must be excluded. *R.*——*P. W.*—Your Weevils are the Curculio Pini, which only attacks coniferous trees: it has been numerous in various localities this season. The best mode of extirpation in young plantations is to hand-pick at night. *R.*——*B. Chilo.*—No. 1 is the Imago of Ephemera vulgata: the previous state is termed the Pseud-imago. 2. Chrysopa perla. 3 is an Ichneumon called Cryptus. You will find the histories and figures of your insects in "Curtis's Brit. Ent.," folios 708, 520, & 668.——*Abdolonymus.*—The history and a figure of your insect are given in the above work, fol. & pl. 37, and it is called Raphidia ophiopsis. It is in no way injurious to Roses, being carnivorous in the larva and imago states: if you will search at night, you will undoubtedly detect the real offenders, which we shall be glad to see. *R.*——*Vesicus.*—Your insect is the male Puss-moth, Cerura vinula. *R.*——*A.*—If you will take an ounce of shag tobacco, and pour a pint of boiling water upon it, and then dip into it the twig of a Rose-bush covered with Aphides, whilst it is tolerably hot, you will find the lice all dead in a few hours; and you may increase the quantity of water until you have ascertained to what an extent the decoction may be diluted to be efficient; but unless you can syringe the underside of the leaves it will have little if any effect on the insects lodged there, and this renders fumigation far superior where it can be applied. *R.*

LARCHES.—*A Reader.*—It is commonly reported that red sandstone produces heart-rot; but we have seen good healthy trees on a bottom of white freestone, which was in some places so thinly covered with soil as to appear above the surface of the ground. The Larch will thrive so as to be a profitable tree in almost all elevated rocky places, or where water does not stagnate; but it evidently dislikes permanently wet land. Rot often occurs in Larches growing in undrained clays, in wet sandy subsoils, in moors and such-like places, which afford a probable explanation of the cause of the evil. Worn out garden ground, or soil rich in humus, is especially unsuitable for it.‡

MANURES.—*A.*—From what we have seen and heard of Potter's guano, we should say that it can produce no such effects as those of drawing up and weakening shoots, and shortening the duration of flowers. We suspect your enemy to be darkness.——*C. L.*—If land is poor, it is as well to give liquid manure to bulbous Iridaceæ and Amaryllidaceæ; but few plants want it less. When administered it should be in very small doses, and when the plants are in full growth; the first application may be when they have fairly pushed; and the last when they are fully in flower. Three or four applications would be enough.——*J. B.*—It is impossible to answer such general questions. All plants like manure, except Heaths and Coniferæ; but the quantity and frequency of the application depends upon their health, of which no one can judge except an eye-witness. As we have frequently stated, the proper way of applying liquid manure is frequently and weak. The operator must judge for himself, from the appearance of the plants under treatment, when to stop. No directions can well be given for such things; experience is the true guide.

MORPHOLOGY.—*Devoniensis.*—There is no end to the proofs of the truth of this branch of science, if people will but use their eyes and understandings. Yours, however, is an unusually beautiful piece of evidence, and we shall get "R. E." to introduce it into his papers, for which purpose a drawing will be made of it. *By-and-bye we shall show why the doctrines of Morphology are important to Gardeners.* They really form the very foundation of some branches of the art of Horticulture.

NAMES OF PLANTS.—*Dugald.*—It is impossible to name foreign seeds.——*J. E. Y.*—Your Lobelia is not nearly so handsome as its parent.——*J. B.*—Your plant is one of the curious shrubby Nolanas. We did not know that they were in this country. Send us a better specimen, with two or three flowers, and it shall be published in the "Botanical Register."——*W. K.*—Callistemon lineare.——*A Subscriber.*—Irises cannot be named with certainty from such badly-preserved fragments.——*J. K.*—It is impossible to name plants without flowers in an *examinable* condition.

OAK BARK.—*Anon.*—Next week.

STRAWBERRIES.—*A Subscriber.*—With regard to the opinion that a fresh plantation of Strawberries should be made every year, to be destroyed after having once borne fruit, and that the finest crops can only be obtained by this method, there are some doubts. Mr. Keens, the fortunate raiser of the seedling which bears his name, and an extensive cultivator, had a tolerable crop the first year, an excellent one the second, and after the third year he destroyed the plantation. Those called Pine Strawberries, such as the old Pine, Keens' Seedling, Elton, &c., will bear well in the same situation for many years, if properly managed. That Scarlets are best when the plantations are frequently renewed is generally admitted; and there are some large varieties which appear to have more or less of the Chili in their constitution, as Myatt's Seedlings, which require that runners be early established for bearing in the following season, as the old plants are apt to die off. As fruit can be obtained earlier in the season from plants that have not previously borne, it is advisable to renew some portion every year; but the propriety of annually destroying the whole depends very much on circumstances; and, therefore, the method cannot be recommended, except in particular cases. Where it is adopted, it is of the utmost importance to root the runners as early as possible, either from plants established in the open ground, or from such as have been forced. Where practicable, it is one of the best plans to lay the runners in small pots. This plan has been known to insure complete success as regards a crop in the following season, when plantations made from plants not so rooted in pots have borne but partially.‡

VINES.—*A Subscriber.*—It will be in favour of the future welfare of your Vines if you reduce the number of bunches to 10 on each, seeing they have not been long planted.‡

MISCELLANEOUS.—*Abdolonymus.*—Numerous articles on watering out-door plants are given in the *Chronicle* for 1843, to which we would refer you, and more especially to p. 499 of the volume for that year, where we have expressed our own opinion on the subject.‡——*A Subscriber.*—Gentianella is troublesome to raise from seed. If well managed the seedlings may flower in the second year, but can hardly be expected to do so before the third. Portulaca Thellusonii is a tender annual.——*Gentlewoman.*—In the first place, your Strelitzia has suffered from removal, and has not yet recovered. Secondly, it is probable that a little bottom-heat is wanted by it; though that is not generally necessary. The genus does very well in loam, and will bear a good deal of dryness. We should expect that your specimen, if it remains in health, will flower again next year.——*A Lady.*—We have sent your letter to Mr. Roberts, and shall probably get an answer next week. We do not think you will find any of your seeds worth growing except Clitoria, Erythrina, and Nerium chartacea.——*Anon.*—Much obliged. Your letter is given to the Superintendent of Police, who has all the arrangements, and will no doubt take means to abate the evil you complain of.——*F. H. R.*—The Number you require to complete your set has been some time out of print.——*An old Subscriber.*—Fruiterers may show at Chiswick against Market Gardeners, but not against private growers.——*A Gallovidian.*—No plants, except lichens, will grow on the steep face of a granite rock, where soil cannot lodge. Unless some means are found of enabling earth to collect, it is impracticable to clothe the rock with vegetation.——*S. Andrews*—Cereus crenatus can only be obtained by Fellows of the Horticultural Society, until it shall have been propagated by the trade. We have not received any previous note. It was raised at Carclew, near Penrhyn.

SEEDLING FLORISTS' FLOWERS.

CALCEOLARIAS.—*J. E. Y.*—Your seedlings are not equal in size, colour, or marking, to the Calceolarias of the present time.*

CARNATIONS AND PICOTEES.—*B. C.*—The Editor will attend to the wishes of his correspondent as soon as the flowers are sent.*

GLADIOLI.—*A. P.*—Your specimen was so shrivelled that we can give you no opinion upon it. We doubt, however, whether it is of any value. Unless seedling Gladioli are very decidedly handsomer than the old ones they are not worth preserving.

PANSIES.—*L. H.*—Your Seedling is of no value; it is deficient in the qualities that constitute a good flower.*

PELARGONIUMS.—*W. D., jun.*—Your flowers were so badly packed that it was impossible to tell to which of the flowers the petals belonged; they were all shaken from their stalks, and mixed together; something soft should have been placed over them. Judging from the petals, they appear to be common sorts, deficient in fine form, substance, and colour.*——*Capt. E.*—Your seedling resembles very strongly a variety called Garth's Witch, with more colour in the top petals; its great fault is its thinness and want of substance.*——*Anon.*—No. 1, dark self, is a very good flower, well formed, but possessing no superiority above many already known. 2 is the most novel; the form is good, and the petals large and flat; it, however, wants size. 3 is rather thin, and too irregular in its marking.*——*E. L.*—Both your seedlings are common, and not equal to sorts of the same character that have been long in cultivation.*——*R. C.*—Your seedlings are very deficient in substance; they are also common in colour and character, and not equal to the cultivated varieties of the present day.*——*A Devonian.*—Such specimens as you have sent come under the denomination of good showy varieties; they are deficient in the higher qualities that constitute the first-rate flowers of the present day. No. 1 is decidedly the best—its white centre, and the substance and fine colour in the lower petals, will make it a favourite. 8 is fine in colour, but we fear the petals curl back. The petals of 6 are all broad, but the upper ones are too puckered and uneven. 4 is too much like many that are already known.*——*M. A. T.*—Your seedling very much resembles a variety named Garth's Witch; the petals are rather long, and any other colour in the top petals would have been an improvement; nevertheless, it is a showy variety.*——*G. L.*—There is one great drawback to your flower—it turns at the edges; it is very like Coronation, but brighter in colour.*——*I. R. P.*—Salamander is beautiful in colour, but wants form very much; the same fault occurs in Marianne, but there is good colour in the upper petals; Mrs. Figs is the best flower in form and substance, and it retains its form well.*——*R. and S.*—A. is a clear showy flower, but too fringed at the edges, and does not differ sufficiently from known varieties. B. is an improvement upon a known flower, named Lady Carlisle; it is a fine clear colour, and appears to keep its form well; the spot is distinct, but too small, as one of the top petals nearly obliterates the spot in the other.*——*I. K. L.*—As the same character runs through all your seedlings, it is useless to criticise them individually; they all want size, form, and substance, and the blotch in the upper petals is generally composed too much of feather. You cannot have saved your seed from the best flowers.*——*Ajax.*—No. 11 is decidedly your best seedling; the flower is clear, bright, and well-formed; in the other three there is a deficiency of form and substance, and they are very common in colour; 9 stands next in good qualities.*——*A Young Beginner.*—The upper petals of your seedling are an improvement upon Garth's Witch; the bottom petals are rather long and thin, and the flower, altogether, not so stout as the one mentioned.*——*H. T.*—Your flowers had unfortunately fallen to pieces, but the under petals are evidently too narrow for a well-formed flower; it is showy and novel, but the form is deficient.*

PETUNIAS.—*S. G.*—Some of your seedlings are very beautiful, and will prove very acceptable to the lovers of this class of flowers, as novel additions to their collections. 54, lavender, with veiny surface, and having a lighter spot in each division of the corolla. 56, similar to 54, but a deeper lavender. 53, lilac, with deep purple crimson veins; a bold and striking flower; centre very dark. 52, Peach-colour, with dark veins and intensely dark centre. 38, ground-colour a degree darker, and veins rather lighter than 52, with the darker colour more spread over the surface. 37 resembles 53, with the ground-colour lighter and the veins more distinct. 26, blue-purple veins upon a lilac ground. 51, purple veins upon almost a white ground. 39, 24, 55, and 56 are not sufficiently distinct.*

ROSES.—*Rosa.*—Your seedling, *Brier* (single) is most beautiful in colour, a rich orange-scarlet, decidedly worth propagating.*

*** As usual, many communications have been received too late

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

GREAT NATIONAL CATTLE SHOW.

THE SOCIETY'S THIRD GREAT AGRICULTURAL MEETING AND CATTLE SHOW, for the Exhibition of Breeding and Fat Stock, Horses, Sheep, Swine, Flax, Wool, Butter, Farming and Agricultural Implements, &c. &c., will be held at the COBOURG GARDENS, Harcourt-street, Dublin, on Wednesday and Thursday, the 14th and 15th days of August next, for the Province of Leinster.

Premiums to the Amount of One Thousand Pounds and upwards will be given on this occasion, for the encouragement of the different Breeds of Stock, including:—Short-horns, Devons, Ayrshires, Herefords, Long-horns, Polled Angus or Galloways, West Highland and Kerry Breeds; also, for fat and Extra Stock not included in the above classes; also, for Horses best adapted to Agricultural Purposes, Sheep, Swine, &c., open for General Competition.

Premiums to a considerable amount will be also given for the best specimens of Butter, Flax, Yarn, and Wool; and a considerable sum of money, besides the Medals of the Society, will be allowed for the introduction and encouragement of Agricultural Machinery and Farming Implements of every description, for which the most ample accommodation will be provided. A large sum of money will be also appropriated for the exhibition of Seeds, Grasses, and Agricultural preparations of every kind, for which a large covered Shed will be erected, capable of affording the fullest accommodation.

The whole area of the COBOURG GARDENS, containing upwards of Eight Acres in extent, will be entirely appropriated on this occasion, and fitted up with separate Stalls, in the most commodious manner, for the exhibition of the Stock, Horses, Sheep, &c., and the different other objects of the Show.

Full Particulars connected with the Show can be had on application to Edward Bullen, Esq., the Secretary of the Society, 37, Upper Sackville-street, Dublin; by whom Premium Sheets and Blank forms of Notices of Entry can now be forwarded, on application, to any parts of the kingdom. Every animal must have a separate Notice of Entry, and all the Notices must be lodged with the Secretary in Dublin, properly filled up, on or before Thursday, the 1st of August, previous to the Show, or else be excluded from competition. Persons desirous of exhibiting large collections of Agricultural implements are requested to send in full particulars to the Secretary, numerically arranged, on or before the 1st of August, in order that they may be published in full in the Catalogue.

The Agricultural Challenge Cup, value One Hundred Sovereigns, given by Peter Purcell, Esq., Honorary Secretary to the Society, for the Best Animal in the Neat Cattle Classes, possessing most merit of its kind, in the estimation of the Judges, and now held by George A. Grey, Esq., with his Short Horned Bull "Recruit," will be also challengeable on this occasion.

The different entertainments connected with the meeting will be conducted on the most extensive scale; and will be open to exhibitors and strangers visiting Dublin at the time of the Show, and every accommodation will be provided for the Exhibition of Stock and Implements in the Show Yard.

Signed by Order, EDWARD BULLEN, Secretary.

Society's Rooms, 37, Upper Sackville street, Dublin.

AGRICULTURAL SCHOOL.

MESSRS. NESBITS' ACADEMY, 38, Kennington-Lane, Lambeth, near London.

"From Chemistry alone further progress in Agriculture is to be expected."—LIEBIG.

In this School, in addition to the general routine studies, every facility is afforded for the acquisition of a sound knowledge of Chemistry. The Pupils are practically taught in the Laboratories the methods of analysing the various earths, soils, manures, &c.; and likewise the means of detecting the substances abstracted from the land by different crops. Land Surveying is also taught practically, as well as theoretically.

A copy of a Lecture on Agricultural Chemistry, delivered by Mr. J. C. NESBIT to the Maidstone Farmers' Club, and the Terms of the School, which vary from 40 gs. to 70 gs. per annum, may be had on application, either personally or by letter.

Mr. NESBIT'S Works on Land Surveying, Mensuration, Gauging, Arithmetic, English Parsing, Education, &c., may be had of all Booksellers.

SATURDAY, JUNE 22, 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, June 26	Agricultural Society of England.
THURSDAY, June 27	Agricultural Imp. Soc. of Ireland.
WEDNESDAY, July 3	Agricultural Society of England.
THURSDAY, July 4	Agricultural Imp. Soc. of Ireland.

FARMERS' CLUBS.

June 24	Chepstow. Wenlock. Fairford. W. Firle.	June 28	Stoke Ferry. Hadleigh. Wrentham. Debenham.
June 25	Bromsgrove. Framlingham. Rayleigh.	June 29	Cardiff. Gloucester.
June 27	Richmondshire. Grove Ferry.	July 1	W. Market.

SOME time ago we received from one of our readers the following communication, signed "C. L.," commenting upon our remarks on MOWING YOUNG WHEAT:—"On reading your Leading Article of the 18th May, on the subject of mowing young Wheat, it appeared to me that if such a method was really beneficial, all my previous notions, which I had obtained through the columns of your Paper, of the great importance of leaves to vegetation, were erroneous, and that leaves were rather prejudicial than otherwise, for in this instance you recommend them to be cut away, to benefit the stem. Such an impression, I think, is natural; but upon reflection, it strikes me that the plan of mowing young Wheat is only a remedy for an error committed in sowing Wheat too thick, and that if a sufficient space between the plants had been left, it would be better to allow the leaves to remain. If leaves are to be considered as so many chemical laboratories always at work in the day-time, preparing food for plants, it does appear an injurious practice to destroy them."

Now, it must be observed that our remarks on this subject were only applicable when the plants, owing to luxuriant soil, wet weather, or other circumstances, had become overgrown, and thus liable to be laid by rain and wind. It must have been a very extraordinary case indeed, that would have benefited by the operation this year, the weather having been so singularly opposed to over-growth of any kind.

We quite agree with "C. L." that drilling Wheat in rows sufficiently far apart, would in a great measure obviate the necessity for this operation; light would then obtain free access to all parts of the plants, unhindered by their luxuriant foliage, and all its beneficial effects would then be experienced without any artificial assistance. For this reason, too, one would think that wide drilling would be particularly suited to wet seasons and districts—that the width of the interval between the plants, from which the maximum benefit is derivable, would be proportioned in some manner to the wetness of the climate.

We mention this particularly now, because we have in process an experiment on a considerable scale, the result of which will enable us to determine, with reference to soils of a certain description, the width of intervals at which, under given circumstances, the farmer ought to drill his Wheat. In accordance with the suggestion of the Editor of the *Gardeners' Chronicle* (in the vol. for 1843), we have divided a 10-acre field into five different plots, in which the seed was drilled in rows, 6, 9, 12, 15, and 18 inches apart respectively. Notwithstanding the dry weather which we have experienced, which if ever thick sowing was advisable would cause it to be so this year, the thinnest sown Wheat, that which is drilled at intervals of 18 inches, is of a singularly luxuriant and vigorous growth compared with that sown at intervals of 6 inches alongside of it. The plants and ears on the thick-sown plot are individually very puny compared with those on the neighbouring thin-sown land; though how far their greater number on a given space will affect the experiment in reference to the produce per acre—this being of course the ultimate test by which the practice must be tried—remains to be seen. We shall report further on this experiment in the autumn, and, along with our own, we shall be happy then to report the experience of any of our readers, on the important subject to which it refers.

IN the year 1834, the Doncaster Agricultural Society published a Report of their Committee on the TURNIP-FLY, and on the means of preventing its ravages. This Report embodied the opinions and experience of 102 correspondents, and though it suggested but few satisfactory means of diminishing the ravages of the fly, yet it was influential in drawing the attention of Entomologists to an insect which had till then almost entirely escaped notice. Accordingly, we find from the paper by Mr. Curtis on this subject, in the 2d vol. of the English Agricultural Society's Journal, that the economy of this little beetle was shortly after that made known by the careful investigations of Mr. H. Le Keux.

We extract the following particulars from Mr. Curtis's communication to the Agricultural Society:—"The eggs of the common striped Turnip-fly are laid on the under side of the rough leaf of the Turnip, from April to September; they hatch in two days. The maggots live between the two skins or cuticles of the rough leaf, and arrive at maturity in sixteen days. The chrysalis is buried just beneath the surface of the earth, where it remains about a fortnight. The beetles live through the winter in a torpid state, and revive in the spring, when they destroy the two first leaves, called the cotyledons, or seed-leaves, of the young Turnip. There are five or six broods in a season. These insects are most to be feared in fine seasons. Heavy rains, cold springs, and long droughts, destroy them. Their scent is very perfect: the beetles fly against the wind, and are attracted from a distance. The rapid growth of the plant is the best security against them: to secure which, sow plenty of seed, all of the same age. Burning the surface of the land is beneficial by destroying the chrysalides. Sheep-folding must destroy the insects in every state. Deep ploughing is an excellent practice when the chrysalides are in the soil. Drilling is a far superior practice to sowing the seed broadcast. Long, raw manure harbours the beetles. The benefit derived from the application of lime and soot is very doubtful. Mangold Wurzel is not favourable to the beetles; and Swedes are probably less attractive than white Turnips. Mixing white Turnips with Swedes is not desirable, as the beetles may be attracted by the strong scent of the former. Early sowing is attended with disadvantages. Destroy Charlock—it affords support to the beetles before the Turnips come up." Hoeing and rolling, constant horse-hoeing, watering the crops, especially with weak brine, fumigation by burning stubble, &c., tend to destroy, harass, and keep off the beetles; and immense quantities may be caught and destroyed by the use of Paul's net, painted boards, &c., drawn over the young Turnip plants.

It is not, however, to these latter remedies that the farmer must look for security from the Turnip-fly; he must adopt preventive, not remedial measures, to insure the safety of his crops from its ravages. Watering plants which are attacked by it may destroy numbers of these insects, but it is an operation which no extensive farmer can undertake. This is evident from the consideration that one day's showers—say equal to an inch of rain—scatters over each acre a hundred tons of water: a quantity which a man, horse, and water-cart could not spread in a week.

The most probable means of destroying these insects are, frequent and deep cultivation during the growth of the plants, and at all other times; and the most probable means of evading their attacks lie in the adoption of such a mode of cultivation as shall cause a rapid germination of the Turnip-seed, and vigorous growth of the young plants through that stage of their existence in which they are most liable to injury from this cause.

AGRICULTURAL IMPROVEMENTS.

WITH reference to my improvements at Tiptree Hall (the expenditure of 6000*l.* on a farm of 130 acres, that only cost 3250*l.* as explained in my two former letters), I am so constantly told, in tones varying from doubt and pity to ridicule and censure, that "It can never pay"—"You will never see your money again"—"You are a bold man"—"It is impossible it can answer—the cost is too great," and so on, that I must endeavour to fill up the outline of my plan with details, and try to convince those whose comprehension of my success is impeded by prejudice. Most of my operations are approved of separately, but there is a dread of the sum total, as if what were individually right could be collectively wrong. I shall show, then,

1st. How the farm is to pay me, as landlord, an additional rent of 240*l.* per annum, with an increased benefit to the tenant, as compared with his former holding.

2d. The intended course of cropping, stocking, and management of the farm.

3d. I will remark on the weak points in the present state of land and system of farming.

4th. I shall submit a few general observations on the non-application of capital to land; and on the importance of agricultural improvements in an economical, social, and other points of view.

In making the following estimates, I have adhered strictly to matters of fact, which I am prepared to discuss and substantiate. I have expressly undervalued the benefits, because I know how suspiciously and sceptically my statement will be scrutinised by those whose minds are pre-occupied by doubts and prejudices, rather than by calculation.

STATEMENT OF ANNUAL GAIN OR SAVING.	£	s.	d.
200 trees removed—estimated to damage by their roots and by their shade, 1*s.* each	10	0	0
950 linear rods (5½ yards each) of removed banks and Fences (Ditches filled up), averaging two yards wide—estimated to damage by their roots, their shade, their encouragement of weeds and vermin, 6*d.* per rod	21	5	0
1-6th saved in horse labour and wear. (This, in the Agricultural Society's Journal, vol. iv. p. 336, is estimated at 1-4th)	21	0	0
1-8th ditto in manual labour	20	0	0
Seven acres gained in fences, &c., which produced nothing, but cost the tenant, rent, &c., 36*s.* per acre	12	12	0
Profit in cultivation of the above seven acres, at 15*s.* per acre	5	5	0
105 quarters of Wheat, thrashed by machine, gain in quantity 1-28th, or 2*s.* per quarter	10	10	0
150 ditto spring Corn, at 1*s.*	7	10	0
Saving in thatching, removing stacks and straw, waste by birds, &c.	5	0	0
Liquid manure tank—we only reckon upon 20,000 gallons, at 50*s.* per thousand, (each 1000 gallons being equal to 4 cwt. guano)	50	0	0
Improved quality of solid manure	10	0	0
Increased value of stock, by warmth, dryness, and diminished consumption of food	15	0	0
General increase on 90 acres of Corn and Clover crops, arising from *perfect* drainage, at 1*l.* per acre	90	0	0
Saving in quantity of seed sown	20	0	0
Twenty acres that used to be long fallowed, at an expense of 5*l.* per acre, now calculated to pay their expenses, if not a profit, by Bean or Root crops	100	0	0
A first-rate house to live in, with every comfort and convenience—the lower rooms eleven feet high, the bed rooms ten feet high, and convenient rooms for the bailiff. (The tenant could not reside in the old dilapidated hovel, which was damp, unhealthy, and caused several deaths by fever)	30	0	0
	£428	2	0

To sum up, whereas the former gross annual return of the farm was under 5*l.* per acre, we shall try to increase it to 10*l.* per acre.

To this might be added several contingent advantages, of considerable value, but not so easily reduced to figures.

1st. The being able to fat at least 100 to 150 sheep more than before, of a better quality, and earlier lambs. The tenant could breed, but never thoroughly fatten a lamb or sheep on the farm in its former cold, wet, and exposed state, with its homestead open to the cutting north-east winds, without gutters or drainage.

2d. The facility of cooking and steaming food, and the economy of several acres that were required for horse food, by growing Lucerne, Tares, &c.

3d. The very important benefit of early sowing and

harvesting. We reckon we shall gain at least a fortnight in both, as proved last year, with superiority of sample, and avoidance of wet weather in September.

4th. A perfect independence (by our efficient drainage) of a very wet season, which has often ruined the crops on this farm; witness 1842, when the Oats yielded but three quarters two bushels per acre, and an inferior sample.

Lastly, The agreeable feeling of having a complete farm, with good roads, comfortable homestead, and good crops, instead of the former dilapidated, beggarly, and poverty-struck land and premises.

The saving of horse and manual labour is considerably underrated, when you consider the ready communication with each part of the farm, the abolition of all short lands, the facility of ploughing or carting at almost any time with less power, the land being firm and mellow, instead of putty-and-paste-like;—no idle days in wet or cold weather, there being employment under cover for men and horses, grinding, chaff-cutting, or thrashing; the facility, at harvest, of drawing the loaded carts into the bays of our large barn, and at once depositing the sheaves;—the ease with which they are transferred from both barn and stacks to the threshing machine, the straw being delivered by the machine into a gallery over the very sheds, yards, and stables, where it is required; no time lost or accidents in leading horses or cattle to water, there being tanks in every yard, and a yard to every stable—all the tanks filled simultaneously from a single pump. There is another advantage of which no valuation is taken, I mean the farmer or bailiff's time; whilst writing up his accounts or arranging his plans, by stepping from one room to the other, he can at once see every man, boy, horse, or sheep, on *any* part of the farm excepting four acres. Any accident, neglect, maltreatment, or pilfering, is perceptible at a glance.

The course of cropping will be regulated by markets and circumstances. It may be stated generally, that on the heavy land Wheat will alternate with Beans and a little Clover and Tares; and on the light land Barley succeeded by Rye for feed, and then roots, so as to have one corn crop, one green crop, and one root crop in two years. Should Flax or Indian Corn be found profitable, we may grow them. It is intended to adopt Mr. Hewitt Davis's excellent practice (which is Jethro Tull's revived) of a small quantity of seed with wide intervals. For carrying out this, no instrument appears so well suited as Newberry's dibbling machine, which will deposit three pecks per acre of Wheat (and other corn in proportion) at intervals of six inches in the row, and the rows twelve inches from each other (Beans, Peas, and Roots we mean to place twenty-seven inches between the rows). By affording a sufficient space for frequent hoeing and cleaning, this will do away with long fallows, secure heavier crops (on drained land) and avoid that competition for support which produces, in luxuriant showery seasons like the last, ruinously laid crops, and lean miserable kernels, which diminish the value of the sample by ten pounds in every hundred. We have found Crosskill's clod-crusher roller of extraordinary benefit in pulverising our stiff land (disordered by drainage and carting), and shall use Hill's pulverising plough with Mason's knives: in fact, take every opportunity, by means of subsoiling, scarifying, &c., to obtain a fine and deep tilth free from weeds; nor shall we debar ourselves from purchasing guano or artificial manures, should such a course appear occasionally desirable. Our great object will be to grow the very utmost that the land can produce by forcing; bearing in mind, that in doing so, we virtually decrease the expense of rent, labour, seed, tithes, rates, and other charges, thereby increasing our profit, and improving the land for the future. We are now using one bushel of bone-dust, dissolved in forty pounds of pure sulphuric acid, to all our root-crops, in addition to other manure.

The stock will consist of twelve head of cattle fed in stalls or boxes (on the principle so ably stated and practised by Mr. John Warnes, jun.), with steamed or cooked linseed, clover, chaff, pulse, potatoes, &c. These cattle will be considered our manufacturers of manure, as the Lincolnshire farmers call them, and if they occasionally pay for their feed or profit, so much the better. As we shall grow annually thirty to forty acres of roots, we hope to be able hereafter to produce food enough for 200 to 300 sheep, to be folded on the land or fed in the yard, according to weather and circumstances, having an especial regard to the well-established fact (as proved by Professors Liebig, Playfair, and others) that with warmth and dryness, a little food fattens quicker than a great deal with cold and wet. All our straw will be cut into chaff for litter. There appear many advantages in this, such as the diminished space it occupies, the readiness with which it absorbs liquid manure, its more rapid fermentation, its avoidance of frequent turning, its portability, both as chaff and manure, and above all, the facility of commixing it intimately with the soil in preparation for root crops. In the tank we shall probably introduce a layer of earth or gypsum between each layer of manure, particularly in the summer season, so as to secure the ammonia. The liquid manure will be applied by a water-cart to the growing crops (the ammonia being first fixed by sulphuric acid) and as the green crops are mowed for consumption in the yard, the liquid manure will follow the scythe. We have also used much common salt, especially on the light land.—*I. J. Mechi*, 4, *Leadenhall-street, London*

(To be continued.)

ON BLACK HORSEPONDS.—No. VII.

IN concluding these papers, I have yet to mention one agent which acts as a vigorous poison when received into the constitution through the lungs during respiration, and which is elaborated in and eliminated by black horseponds; namely, sulphuretted hydrogen. It has long been known that this gas, when inspired, produces very injurious effects on health and life, even though largely diluted with atmospheric air. The experiments of Messrs. Thénard and Dupuytren have shown that birds are destroyed in an atmosphere containing only $\frac{1}{1500}$th part of this gas, and that air containing $\frac{1}{150}$th part will kill a horse in a short time. Sulphuretted hydrogen has long been suspected to play an active part in the production of malaria; producing in warm climates yellow fever, and in the more temperate regions fevers of a bilious and typhoid character, as well as ague. Until recently, scientific men have failed to demonstrate its existence in places known to be malarious; Professor Daniel, however, in 1841, succeeded in detecting quantities of this gas in some specimens of water submitted to his notice by the British Admiralty for analysis. These specimens were from the African rivers, Bonny, Sierra Leone, Monney, Congo, and the adjacent seas. Dr. Marcet found the same gas in the waters of the Yellow seas; and Mr. Gardner, of London, also found it in water from the Booney and Lagos. All these localities are reputed for their insalubrity, and we have recently had melancholy proof of the same in the late Niger expedition. The same causes which produce the yellow fever in the African rivers are in activity in our own country, producing malarious disease, modified by climate, such as the agues and bilious fevers of the Fens of Lincolnshire, the Isles of Ely, of Sheppey, and many other localities.

The active agents in the formation of sulphuretted hydrogen in these localities are, vegetable matter in a state of decomposition, sulphates, water, and heat. When vegetable matter, in a state of decay, is placed in contact with sulphates in solution, these latter undergo decomposition, oxygen is abstracted, and sulphurets are produced; the latter in their turn yield sulphuretted hydrogen with the first nascent hydrogen they encounter. The final compound of these bases is probably a carbonate. That sulphuretted hydrogen is thus produced is a matter of demonstration. Professor Daniel put decayed leaves together, with water containing sulphate of soda, in a jar, and subjected them to the action of summer heat; in three months sulphuretted hydrogen was abundantly given off, and the salts decomposed. If no sulphate be present either in the vegetable matter or water, the gas will not be given off.

Now in black horseponds we have all the circumstances necessary for the generation of this deleterious gas; we have vegetable matter in a state of decomposition, and also the sulphates in solution, such as sulphates of lime, soda, potash, and magnesia: these latter are contained in the saline matter of the urine, and when these ingredients are warmed by the sun, during the summer and autumn months, we have sulphuretted hydrogen generated in abundance; this gas constantly being evolved from the surface of such waters, renders the air above and around highly pestilential. That sulphuretted hydrogen does exist in and is evolved from the surface of black horseponds, we have only to use as a test a piece of pure silver. If a piece of pure silver be partly coated with grease or varnish, and be suspended for a few days above, or in the horsepond, or in any locality where the gas is disengaged, it will be found to have acquired a colour varying from the palest yellow to orange or brown on the part uncovered, while the varnished portion will retain its original brightness, showing by the contrast of colour any change in the exposed portion. This change of colour arises from the suphur combining with the silver, and forming a sulphuret of that metal. The same change occurs when a silver spoon has been used in eating an egg—the egg containing a portion of sulphur. The smell of rotten eggs is, in fact, sulphuretted hydrogen, given off by the decomposing animal matter of the eggs. The rapid tarnishing of silver or plated goods in towns arises also from the same cause, this gas being evolved from the sewers and drains in abundance.

Although the amount of this gas evolved from the black horsepond may not be sufficient to endanger the life of the animal, diluted, as it must be, by atmospheric air, yet, when so deadly a poison is mixed with the air we breathe, it must produce an injurious action on the animal economy, impairing the functions of every organ in the body, and interfering with that regular process of health, which it is the interest of every farmer to maintain in his feeding and fatting stock. To the existence of such causes, also, may perhaps be attributed those epidemic diseases which so often attack, and not unfrequently carry off much valuable stock, to say nothing of the fevers which may arise in his own or his neighbour's family from the same source.

The farmer may devote his time and attention to breeding and rearing the best cattle—providing the most nutritious food—feeding on the best principles—erecting the best-constructed sheds with regard to aspect and warmth, with all the *et ceteras* conducive to profit; yet, if he neglect to keep up vigorous health in his stock by supplying pure water, instead of water polluted with the excrements of his cattle, all his exertions will be in vain—his cattle will be longer in feeding, consuming much food, and will never arrive at that state of perfection which it is his object to attain.—*Alfred Gyde, Painswick.*

SKETCHES OF EAST LOTHIAN HUSBANDRY.

Management of Manures.—After the farmer has rendered his fields free from superfluous moisture, the next great object of his care is to enrich them with manures. Experience has taught every practical Agriculturist that, notwithstanding all his attention to complete drainage, minute pulverisation, thorough eradication of weeds, and strict adherence to alternate cropping—indispensable towards perfect husbandry as these unquestionably are—his land will certainly and speedily become deteriorated in condition, and his crops vastly diminished both in quantity and in quality, unless the productive powers of the soil be kept up by regular applications of enriching manures. Close and severe cropping being the leading feature of the agriculture on the strong fertile soils of East Lothian, frequent and liberal manuring obviously becomes indispensable. The collection and judicious application of manure are, therefore, matters of no trivial importance; for it is obvious that on the quantity he is able to accumulate, and the judgment displayed in its management, much of the productive capabilities of his land, and consequently of the extent of his own success, will ultimately depend.

The East Lothian practice of former times in the management of dung, appears to have been extremely defective. The great error consisted in giving too large a quantity at once, and at very long intervals. At one period the quantity of manure bestowed was very great—sometimes triple, and always double the bulk now applied—thereby surfeiting one field and starving others, or, to use the words of an old agricultural writer of this county, "The soil rioted in the midst of plenty for two or three years, and fasted or starved for several succeeding seasons. Hence the generality of fields were either too rich or too poor; either saturated with manure, or completely barren for the want of it." The practice of the old farmers was, in other respects, equally injudicious. Within the last 20 years, however, very considerable improvement has taken place in everything relating to the management of manure; indeed, it may be truly said that a great deal more anxiety and judgment are displayed in the collection and general management of manures by even the worst farmers of the present day, than what were shown by the very best some 30 years ago. But, notwithstanding the increased attention now everywhere paid to this valuable substance, it must be acknowledged that very ample room still exists for further improvement in the East Lothian mode of managing it. There are undoubtedly many substances, both of a solid and a liquid nature, either entirely lost, or allowed to remain in a state worse than useless, which might very easily be converted to the most useful purposes. Large sums of money are annually expended in this county in purchasing guano, nitrate of soda, and other foreign "fertilisers," whilst considerable quantities of equally valuable substances of home production are either altogether neglected or but partially employed. In point of soil, cultivation, and produce, East Lothian, it is freely conceded, ranks first in Scotland; and in some of these respects, particularly in its mode of tillage, it will at least bear a comparison with the most improved districts of England; but the greatest admirers of the system of farming here pursued acknowledge that, so far as relates to the general economy of manures, the practice of the East Lothian farmers is not deserving of similar commendation. It is to be hoped, however, from the general anxiety which now happily prevails amongst the farmers, to hear and, so far as practicable and profitable, to adopt the suggestions of men of science on this important subject, that in the management and application of manures, too, the spirited farmers of East Lothian will not long remain behind their neighbours. In my further remarks upon this subject, I shall restrict myself chiefly to details of the mode of managing farm-yard dung and other manures, now pursued by the best farmers in the county. The reader may then judge for himself, as to the merits or demerits of our practice in this department of rural economy.

Farm-yard Dung.—Until a comparatively recent period, muck, lime, and seaweed, were the chief, if not the only species of manures, used in this county. During the last twenty years, bone-dust and rape-dust have been extensively employed in Turnip culture; but these, though once highly prized, are in their turn likely to be superseded, at least for some time, by the various other fertilisers now so much in vogue. But, notwithstanding the comparative cheapness and efficacy of many of these new auxiliaries, it is still on the old "muck midden," or dung-hill, that the farmer's chief reliance is placed.

The practice universally adopted throughout the Lothians, of feeding cattle of all kinds and ages, except milch cows, in open fold-yards termed closes, with accompanying shelter-sheds, greatly facilitates the rotting of straw, and the accumulation of dung, fresh litter being constantly required to keep the yards dry and clean, and straw given unsparingly as fodder, the excrements of the cattle uniting with the straw, and all compressed together into one mass of animal and vegetable substances. Of course, the yards occupied by cattle fed on Turnips and Oil-cake, contain the best dung. In the majority of the newly-erected farm-steadings, the stable opens on one side upon some one of these yards, the dung and soiled litter from which are regularly scattered over the yards, when cleaning out the stable every morning.

When the dung has considerably accumulated in the yards, or has become pretty well rotten, it is carted out at convenient opportunities, to the fields to which it is afterwards to be applied, and there stored up in large heaps, here called middens. The carting of dung from the yards to the fields intended for green crops, proceeds during the winter, as suitable opportunities occur, or when the state of the weather prevents the other operations of the farm from being carried on. Hard, frosty weather is, for obvious reasons, always preferred; but the work is proceeded with at all times during the winter

and spring, when the ploughing is suspended by heavy falls of rain or snow. A convenient spot near to the entrance gate of the field is selected for the site of the dunghill, a few cart-loads of the roughest of the dung are first carried out, and the whole of the intended site filled with it, in order to prevent the cart-wheels from sinking into the soft land. The heaps, for the convenience of after turning, are seldom more than five or six feet high, and so wide as to allow the horses and carts to turn, when unloading, on the top. The fields being, generally speaking, rather large, and often of irregular surface, two heaps are commonly made of the dung to be applied, so situated as to economise, as much as possible, the after cartage. When taken out in winter, the horses and carts are allowed to go up and unload upon the heap, one end being left low for that purpose, and afterwards made up uniform with the rest; but the dung taken out to the fields during the spring, or shortly before being required for application to the land, is never carted or trodden upon. In this case the carts are backed up to the heap, and the dung thrown loosely together with a grape or fork. The heap not being consolidated by unloading upon it, the process of fermentation commences immediately after its formation. Double-horse turn-up, or as we call them coup-carts, are invariably used in conveying dung from the yards to the fields. All the yards, sheds, and houses are cleaned out generally about the middle or end of March, for the dung to be that year applied to Beans, Potatoes, and Turnips; what is collected from that period till June being reserved for the land (if any) to be summer-fallowed. The dung carted out in winter is, in most cases, completely turned over about three or four weeks before being applied to the land, in order to mix all the different parts minutely together, and to bring the entire mass into the requisite degree of decomposition; the heaps intended for Beans, Potatoes, Swedish Turnips, &c., being turned over in the order in which they are wanted for application. This operation is usually done by contract. In some parts of the county women are preferred to men for turning dung, the former being supposed to take smaller grapefuls, and mix the parts more intimately together, than the latter. The workmen invariably begin at that end of the dunghill on the lowest ground, and after marking off a strake or division, about one and a half or two yards wide, according to the depth, they turn it over into a mud heap, laying that which was originally uppermost underneath. The use of the dung-spade in cutting the dung perpendicularly greatly facilitates its lifting with the grapes. When arrived at the bottom of each division a portion of the earth is thrown over the top of the newly-turned dung. Another division of the heap is then marked off and turned in a similar manner, and so on until the whole is completed. Should the dung be very dry and but slowly decomposing, it is customary to saturate it perfectly with water, in the absence of rain, while turning it over, which considerably accelerates the fermentative process. Latterly a few farmers, while turning their manure heaps, have sprinkled them over with a little gypsum, in order to fix the ammonia evolved during the process of fermentation. Others are beginning to use diluted sulphuric acid for the same purpose.

After the whole has been turned, the sides and top are covered with earth for the purpose of protecting the dung from the effects of the sun and wind, and to absorb the volatile gases disengaged in the process of fermentation. Dung carted out during the spring and intended for Potatoes, is seldom turned over in the field, it being considered that this crop does not require the manure to be brought to the same degree of decomposition as for Turnips or other crops having small seeds. The dung intended for application to the fallows is usually turned over in the yard in which it has been collected a short time before being required for use. If very dry, as is generally the case at that period of the year, water is copiously added. Wet weather is always preferred, especially in summer, for performing this operation.—*T. Sullivan.*

ON MINERAL AND INORGANIC MANURES.

No. XIX.

By Professor Charles Sprengel.

(*Continued from page* 394.)

4. *Clay and Loam.*—Clay, as we know, is a very fine grained earth, which consists of a chemical compound of alumina and silica, with a great quantity of *free* silica and alumina, more or less oxide of iron and manganese, silicate of lime, potash, soda, magnesia, and iron. Most sorts of clays contain, moreover, a small quantity of gypsum, common salt, phosphate of alumina, phosphate of iron, or phosphate of lime. Notwithstanding, therefore, that the chief component parts of clay are silica, alumina, and oxide of iron, which have little value as manures, as most soils contain them in sufficient quantity, still it also contains a small proportion of those substances, which are essential for the nourishment of plants, and often wanting in several sorts of soil.

Loam differs from clay only in the coarseness of its grains, consisting mostly of quartz, but at times also of felspar, mica, silicates of potash, lime, &c. which are mixed more or less with the fine argillaceous parts. These must not be left unnoticed, if a correct idea of the action of both clay and loam is to be formed. Both improve the soil, not only mechanically, but also chemically, as they contain substances which really nourish plants.

Clay and loam have long been used in their natural state as well as roasted, in the manuring and improving of fields; and although some believe that the manuring with burnt clay is a discovery of recent date, it can be proved that it has been used in some countries for the last 150 years. In its natural state, clay is merely used for improving sandy, marshy, peaty and chalky soils; because, although matters essential to vegetable nourishment are thus added, the main object is to improve their texture. In a roasted state, however, clay is used on all sorts of soils, as it will not only improve most of them mechanically, but all in a chemical point of view. We shall speak first of the manuring with clay or loam in their natural state.

Both will decompose, but very slightly, the coal of humus or the vegetable matter in the soil, as they do not contain any powerful bases (as soda, lime, potash) either free or combined with carbonic acid. If, on the other hand, the bases which are contained in the clay or loam combined into silicates by silica, are to become useful to the plants, the soil must contain a substance which will decompose the latter. Such is humic acid, which combines with the lime, magnesia, soda, and potash of the silicates into salts, which being soluble in water, will pass into the plants. Humic acid is the more important as it has to dissolve such phosphates as may be contained in the clay, and to convey them to the plants; because, although the carbonic acid, which comes with the rain water into the soil, or which is formed by the humus, acts similarly to humic acid, yet its action is very slight.

The circumstance, that clay and loam always contain only small quantities of gypsum, common salt, and silicates of lime, magnesia, potash, and soda, as well as phosphates, compel the use of them in large quantities, if they are intended to improve the soil chemically, and to nourish plants. In sandy and marshy soils this is the more necessary, as they are also required to improve them physically.

I have analysed several sorts of loam which are employed with great effect for the improvement of sandy soils, and subjoin two such cases, as I shall thus be better able to explain their action; and they may serve as a guidance to those who may wish to manure their soils with loam.

a. 100,000 parts of a loam employed for the improvement of a sandy soil, rich in humus, contain:—

95,104	parts	silica and quartz sand	
2,520	,,	alumina, partly combined with silica	
1,460	,,	oxide of iron	ditto
0,048	,,	oxide of manganese	
0,336	,,	lime combined with silica	
0,125	,,	magnesia	ditto
0,072	,,	potash	ditto
0,180	,,	soda	ditto
0,072	,,	phosphate of lime	
0,048	,,	gypsum	
0,035	,,	common salt	
100,000	parts.		

Of this loam not less than 200,000 lbs. are to be put on one acre, to produce a good effect; the soil will then receive 5000 lbs. alumina, partly as clay, and partly in a free state, which will not only increase the powers of the soil for retaining water, but will in some degree decompose the humus; it will also receive 670 lbs. lime, which will become gradually available for plants, as the humic acid of the soil separates it from the silica; 250 lbs. magnesia, which will also reach the plants by means of the humic acid, and suffice for many crops; 150 lbs. potash, and 360 lbs. soda, which, like the lime and magnesia, will be separated from the silica; 150 lbs. phosphate of lime, which is soluble in carbonic and humic acid; and 96 lbs. gypsum, and 70 lbs. common salt, which the rain water will convey to the plants. The quantity of phosphates of lime contained in loam may be somewhat greater, but as one crop does not require of this substance, as has been stated above, more than 5 lbs. or 6lbs.; the quantity of it present will suffice for 30 crops; the same will be the case with gypsum and common salt. But it is not to be forgotten that part of the mineral substances conveyed to the plants reverts again to the soil as manure; while some portions may be altogether lost, as they are dissolved and carried away by the atmospheric water. If instead of 200,000 lbs., 300,000 lbs. of loam are conveyed on one acre of land, one-third more of all these mineral substances will reach the soil, and the effect will be then the greater; but it is the province of agricultural calculation to see whether the increased expense will be commensurate with the result to be obtained. If the texture of dry sandy soil be improved by loam, as it certainly will if the above quantity be used, it is also to be considered that the dung will afterwards be of more avail to the crops, as it will be less apt to volatilise, and to be extracted by the rain.

100,000 parts of a loam which was used for the improving of a sandy soil, which contained 2½ per cent. of humic acid, and was not entirely deficient in lime, magnesia, potash, soda, gypsum, &c., was composed of

95,365	parts	silica and quartz sand	
1,600	,,	alumina mostly combined with silica	
2,140	,,	oxide of iron	
0,200	,,	oxide of manganese	
0,135	,,	lime combined with silica	
0,040	,,	magnesia	ditto
0,087	,,	potash	ditto
0,090	,,	soda	ditto
0,260	,,	phosphate of lime	
0,065	,,	gypsum	
0,018	,,	common salt	
100,000	parts.		

By the application of 300,000 lbs. of this loam per acre. we therefore convey to the soil 4800 lbs. alumina, 405 lbs. lime, 120 lbs. magnesia, 26 lbs. potash, 270 lbs. soda, 780 lbs. phosphate of lime, 195 lbs. gypsum, 54 lbs. common salt, &c., all which substances will supply many crops with the necessary nourishment.

Clay always contains not only more alumina (at times 20 per ct.), but generally more gypsum, common salt, potash, soda, lime, and magnesia, on which account such large quantities of it as of loam, are not required. This, however, can only be decided with accuracy, by subjecting it to chemical analysis, as this is the only means to ascertain the amount of the manuring substances, which are thereby conveyed to the soil. It is not necessary to state in detail that clay and loam will never improve the soil as clayey marl does, and that they are only to be used when the latter is not at hand.

ON BONES AS MANURE.

The chief ingredients of which the bones of animals consist are gelatine (glue), and the phosphates of lime and magnesia. They contain about 34 parts of gelatine, and 57 parts of the phosphates of lime and magnesia; and, besides this, a small per centage of carbonate of lime (chalk), and fluoride of calcium (Derbyshire spar). The only ingredients of any importance to agriculturists are those which form the chief bulk of bones, viz., gelatine and the phosphates. Bones are employed in two forms, either unboiled or boiled. Let us consider what takes place when bones are boiled in water. The gelatine dissolves, and the earthy matter of the bones remains, retaining the form of unboiled bones. The question now is, What part does the gelatine play in the nutrition of plants? It has been proved that gelatine, as such, cannot be taken up by the roots of plants, and it is only by its conversion into carbonate of ammonia that it is able to benefit a crop. Gelatine contains all the ingredients necessary for this conversion, which, however, takes place but slowly. Carbonate of ammonia is taken up readily by the plant, and is expended in the formation of substances containing nitrogen. The chief objection to this salt is its volatility; it therefore becomes a question of practical importance to the farmer, whether it be not more profitable to make use of boiled bones, if they can be got cheaper, and to supply a safer and cheaper substitute for the gelatine, viz., a substance capable of yielding nitrogen to plants without much loss. It can be proved that a great loss takes place in unboiled bones in the soil during autumn and winter, by the volatile nature of carbonate of ammonia. Of the importance and use of boiled bones, those only will doubt who know nothing of the uses of phosphates in the economy of vegetable life, and who believe the effect of bones to be solely owing to their animal matter. The importance of phosphate of lime will be manifest, when we are informed by chemists that the ashes of the seeds of Wheat contain 44½, those of Barley 32, and of Peas 17½ per cent. of it. How could the bones of children and animals be formed, were they not contained in their food, which has been abstracted from the soil? We know that bones, by boiling, are only deprived of their gelatine; and they consist, after boiling, almost wholly of phosphate of lime. The price of boiled bones is less than half that of unboiled; and since most people will allow that the gelatine may be substituted, why not make use of a substance fitted for immediate use by the plant? Such substances are sulphate of ammonia, muriate of ammonia, nitrate of soda, and guano. Eight pounds of sulphate of ammonia to every cwt. of boiled bones would amply compensate for all the nitrogen which the same quantity of unboiled bones could yield, provided all its nitrogen were imbibed by the plant,—a case which never occurs. It may be urged, and truly, that unboiled bones are of longer duration than boiled bones. This is partially true, owing to the protective influence of the gelatine; but they have the disadvantage that, unless finely ground, they do not exercise much influence upon the plants in the first year, whilst boiled bones benefit the crops immediately. When the land is very deficient in phosphates, it will be very materially cheaper to the farmer to apply boiled bones, because with every cwt. of these he supplies one-third more phosphates at half the expense. The objection against the shorter duration of boiled bones is easily obviated by the application of a quantity rather more than sufficient for the supply of a rotation of crops, with phosphates, and in the manner recommended by Professor Liebig, viz., by dissolving them in acid. For this purpose, 1 cwt. of boiled bones will more than suffice for the supply of a statute acre of land, with the necessary quantity of phosphates required by the ordinary rotation of five crops. It is better to add more than a sufficiency, as by these means the land is gradually improved without unnecessary outlay of money. In order to effect the solution, proceed as follows:—1 cwt. of the ground boiled bones are to be placed in a wooden tub, and 3 cwt. of water to be poured upon them; 70 lbs. weight of sulphuric acid (oil of vitriol of commerce) are now to be poured into the tub, and the mixture to be well and frequently stirred. Effervescence takes place, owing to the decomposition of the carbonate of lime, contained in small quantity in the bones, and the expulsion of carbonic acid, for which reason the tub must only be two-thirds filled. In this process the following decomposition takes place:—The sulphuric acid, combining with the lime and magnesia of the bones, forms sulphate of lime and sulphate of magnesia (gypsum and Epsom salts), and renders the phosphoric acid soluble, which, together with the sulphate of magnesia, is dissolved in the water. Allow the liquid, &c., to stand over night, and mix it upon the following day with dry charcoal, sawdust, and soil, until all the liquor is absorbed, and the whole forms a stiff mass. Take it out

of the tub, spread it out, and dry it in the sun, or in a warm place, and apply it by the drill. If it is to be used on pasture land, the best time will be the end of March.

Let me here remind the farmer that in buying unboiled bones, he should recollect that the younger the animals have been from which the bones have been taken, the greater will be the quantity of gelatine contained therein, and *nice versâ*. Old farmers have observed that the bones of horses (which are only killed when old and unfit for use) are preferable, and of longer duration than those of any other animal. This is evidently owing to the large amount of phosphates which they contain, varying from 70 to 85 per cent., thus confirming the view I take on the subject of boiled bones. The agriculturist will find it of more advantage to use the gelatine of unboiled bones, for nourishing his pigs, than for applying to his land. It will well remunerate him to buy fresh bones for the purpose of boiling them together with other messes for nourishing his pigs.

If the farmer does not wish to dissolve his bones after the efficient manner proposed by Liebig, it is better to use bone-dust. He must not, however, imagine that bones are a substitute for guano or farm-yard manure. If the land is only wanting in phosphates, with nothing either better or cheaper can they be supplied than by means of bones. They are often found to produce no effect, and in every such case which has come under my notice, I have found that the land either contained a sufficiency of phosphates, or demanded a supply of alkalies. Bones are almost as much misapplied as lime. All that can be answered for certain to the inquiry, When should bones be applied? is, that pasture lands, on which cattle have been continually fed and brought up, without any substitute for the substances the earth has furnished, with the exception of the manure of these cattle, must ultimately fail, unless the bones of these cattle be restored. By means of analysis a certain answer may be given.

We now come to the adulteration of bones. Unboiled bones can only be adulterated when finely ground: there are then often found mixed up with them carbonate of lime (chalk, oystershells), lime, sulphate of lime (gypsum), and sulphate of barytes. The most common adulteration is the first, the detection of which lies in every one's power. Take a weighed sample of bone-dust and place it in a small Florence flask, the weight of which is known and noted down; as much muriatic acid (spirits of salt), diluted with its own weight of water, as there is bone-dust is to be poured into the flask upon the bones; violent effervescence takes place if adulterated with chalk, whereas only slight effervescence if unadulterated. Bone-dust contains naturally about 3 per cent. of carbonate of lime. After all effervescence has ceased for some time, weigh the flask open; the loss in weight will show the amount of carbonic acid, from which the quantity of chalk contained in the bone-dust may be estimated, remembering that every 45 parts of carbonic acid corresponds to 100 of chalk. An adulteration with lime may be proved, firstly, by an alkaline taste; and, secondly, by washing a small portion of the bone-dust with water, filtering and adding a clear solution of carbonate of soda or oxalate of potash to the filtered liquid. In both cases, a white precipitate indicates the certain presence of lime. If an adulteration with sulphate of lime, or sulphate of barytes be suspected, (this is found out by the increased weight,) the quantity may be thus detected:—Take a dried and weighed sample of bone-dust, put it into a Berlin porcelain evaporating basin, and pour a quantity of slightly diluted muriatic acid, sufficient to dissolve it. Heat it and filter through filtering paper, and wash the residuum, if any appreciable quantity there be, with clean water. Dry the filtrum, separate the powder, and weigh it; the weight indicates the amount of adulteration. Should you wish to know whether it be gypsum or sulphate of barytes, pour a little water on the powder, and filter it; add a small portion of a solution of chloride of barium to the filtered liquid; a white precipitate would prove the adulteration to be gypsum, no precipitate (sulphate of barytes is insoluble) would indicate sulphate of barytes. If the experimenter in testing for chalk should find none, he may add a small quantity of fresh acid, and heat the flask over a spirit-lamp until nothing more dissolves; an appreciable residuum would indicate an adulteration.

The only adulteration of which whole boiled bones is capable is water. This may amount to 30 per cent. Any one who has seen a dry bone will not be taken in. I only mention this adulteration, because I have met with farmers who told me that they preferred the boiled bones, just as they are taken from the boilers.—*Albert J., Bernays, London.*

THE ROT IN SHEEP.

THE first symptoms attending this disease are by no means strongly marked; there is no loss of condition, but rather apparently the contrary; indeed, sheep intended for the butcher have been purposely cothed or rotted in order to increase their fattening properties for a few weeks, a practice which was adopted by the celebrated Bakeley. A want of liveliness, and paleness of the membranes, generally may be considered as the first symptoms of the disease, to which may be added a yellowness of the caruncle at the corner of the eye. Dr. Harrison observes, "When in warm sultry and rainy weather, sheep that are grazing on low and moist lands feed rapidly, and some of them die suddenly, there is fear that they have contracted the rot." This suspicion will be further increased if a few weeks afterwards the sheep begin to shrink, and become flaccid about the loins. By pressure about the hips at this time a crackling is perceptible now or soon afterwards, the countenance looks pale, and upon parting the fleece the skin is found to have changed its vermilion tint for a pale red, and the wool is easily separated from the pelt; and as the disorder advances the skin becomes dappled with yellow or black spots. To these symptoms succeed increased dulness, loss of condition, greater paleness of the mucous membranes, the eyelids becoming almost white, and afterwards yellow. This yellowness extends to other parts of the body, and a watery fluid appears under the skin, which becomes loose and flabby, the wool coming off readily. The symptoms of dropsy often extend over the body, and sometimes the sheep becomes chockered, as it is termed—a large swelling forms under the jaw—which, from the appearance of the fluid it contains, is in some places called the watery poke. The duration of the disease is uncertain; the animal occasionally dies shortly after becoming affected, but more frequently it extends to from three to six months, the sheep gradually losing flesh and pining away, particularly if, as is frequently the case, an obstinate purging supervenes.

With regard to our remedial measures, little satisfactory matter can be offered. There are few drugs which the laboratory can supply but what have been tried and found wanting; and though salt has appeared to have had more effect on it than anything else, it must be confessed that hitherto medicine has offered no remedy for this formidable and destructive disease. Prevention must be our chief aim, and it is satisfactory to know that much can be done by means of extensive and general draining; and it is hoped that before long, by the aid of the legislature and the conjoint energy and capital of both owners and occupiers of land, the system will be adopted almost universally, by which alone this disease is likely to be controlled or eradicated; and at the same time increased labour employed on the land, and more abundant crops obtained from the bounty of Nature.

It appears that, whether as a preventive or as a cure, salt has a more powerful influence over this disease than any other remedy. Its presence preserves even wet pastures from the disposition to give the rot, for it is well known that salt marshes are free from danger. In what manner salt thus operates it is difficult to explain. The blood in this disease is in a state of unnatural dilution—it is deficient in its fibrous and colouring principles: now, whether salt, which is a combination of chlorine and soda, acts by restoring some portion of those salts of which the blood is deficient, or whether it is prejudicial to the vitality of the flukes and the eggs, or whether it acts by the antiseptic power which belongs to chlorine, we cannot tell, though its influence over the disease is generally acknowledged.

Our own advice as to remedial treatment may be summed up in a small compass. The sheep should be removed from the unsound pasture as soon as possible, either to a salt marsh or the driest pasture that can be found; as much salt may be given as the animals will take with their food; to this the sulphate of iron may be joined. Half a drachm daily for each sheep, with the same quantity of ginger, may be given in nourishing gruel. An aperient should be given once or twice during the treatment, and may consist of one or two ounces of sulphate of magnesia, or a large table-spoonful of common salt dissolved in warm gruel or water. Food should be given in as nutritious a form as possible; and a pint of Beans daily will be an excellent diet with good Hay on sound pasture.

Though Turnips cannot be considered as a cause of rot, yet from the superabundance of water they contain, they are highly prejudicial to sheep that are affected with the disease, particularly if taken whilst a hoar-frost is on them. Calomel has been strongly advised, but the recommendation, as far as I am aware, has not been backed by any successful cases. If tried by way of experiment, about five grains daily, with four of opium, suspended in thick gruel, may be repeated once a day for the space of a week at a time.—*Extracted, by permission, from Mr. Spooner's forthcoming work on the Sheep.*

Home Correspondence.

The Tussac Grass.—We are indebted to the kindness of Sir William Hooker for the opportunity of publishing the following extracts from a letter addressed to him by the Governor of the Falkland Islands:—"*Feb.* 1, 1844.—If you take this valuable production of Nature in hand, and make it known in England, there will be no doubt of its being both valued as it ought to be, and extensively grown in the parts of the country best adapted for it. I can now further add, that the experiment of sowing seed in common garden mould in a spot not under the immediate influence of the spray of the sea answers perfectly, as also transplanting the young plants from the natural habitat to other and totally different sites and soils; both these I have proved to my utmost satisfaction, and I have also tried it in garden ground richly manured. In fact, I am inclined to think that the Grass will answer anywhere, and in any soil. To be on the safe side, not to mislead people, I have only mentioned in my despatches the sites natural to it, and have said it may be cut twice in the year, but I think it may be gone over four times. It grows rapidly, and improves much by cutting, but is decidedly injured by grazing, at all events, for the first three or four years. It is my intention to plant out a large field at Port William, the site of the new town, planting it in rows; and as I think there is every probability of Oats and Barley answering well, I shall be able to keep my horses in the stable, foddering them with bundles of Tussac instead of hay; and keep my cows and sheep about the premises by throwing them down bundles of Tussac at night. It must be recollected that this Tussac grows, and can be cut, winter and summer alike. You will probably agree with me that it ought to be immediately tried at the Orkneys and Shetlands. It would be a wise thing in the gentlemen of these Islands to subscribe, and send an agent here to collect seed and study the habits of the Grass; he should arrive at the latter end of October, and start again after three months' residence, bringing with him a small portable house (in preference to a tent) from Manning, the builder, of Stepney and Holborn. The house should be the *fac simile* of one he has lately sent me, by order of Government, for the Survey Department. It is 10 feet square, fitting in pannels, with a hipped roof and two glass doors (so as always to have one to open to leeward). The expense is about 20*l.* or 25*l.*, and would sell when he went away for 30*l.*, or more. It puts up and takes to pieces in a few hours. He should also bring about 200 bricks, a small barrel of lime, and a ton or two of coals, with biscuit, tea, and sugar. You see I am practical in my ideas, and descend to details. Experience makes every person practical. The expense of sending such an agent would be far more than repaid by the abundance of seed he could collect, and the care he would take of it on the passage home. I have sent some seed to you inclosed in a box, with much more to Lord Stanley. A settler here sends, by the same opportunity, a quantity on speculation for sale. I hope every summer to be able to collect some from "Hooker's Islet," at the sea-board, at the east end of Jackson's harbour; your son knows the place. Mind the birds when the seed-vessels are ripening on the Grass. I was robbed of all mine from the patch in the garden in one morning. On the Tussac Islands, when the seed is ripe, our Falkland sparrows are in myriads, filling the air with their chirpings of delight. I must stop about the Tussac, or you will think I ride my hobby to death. Who, however, can help being enthusiastic when, filled with gratitude to a bountiful Providence, he contemplates this valuable production, and yearns with earnestness for it to be appreciated as it ought to be, clothing hereafter the wild sea-beaten regions of the North with its rich vegetation? My heart is always full when I think upon it. Your son will be pleased to hear that a patch of Barley, the seed being brought from so warm a latitude as the Rio Negro (lat. 39 deg.), is now in ear, as is also a patch of Oats; the latter being exceedingly vigorous and strong, not even in the very slightest degree affected by the wind. It will be a patriotic act to send us some Scotch Oats, Rye, Barley and Wheat, Clover-seed and Rye-Grass. The Elder-trees are high and strong, as are the Gooseberries and Sweet Briar, Broom, &c. Roses from St. Helena are doing extremely well. Many of the "Antarctic" trees in the grave-yard are doing well, chiefly the Beeches."—*R. C. Moody.*

Adulteration of Manures.—I am grieved to say that I have had full confirmation of the truth of your Leading Article in last week's Paper. I purchased 5 quarters of what is called bone-dust of a neighbour, intending to have all I wanted of him this season; I put 4 bushels in a tub, and mixed it with acid; I soon discovered that it was not all bones, but a mixture of lime-plaster with other rubbish. I found a bushel weighed exactly 70 lbs., when a bushel from Messrs. Porter, of Bristol, weighs 46 lbs.; I therefore conclude that not more than 40 or 50 per cent. is bone. As soon as I discovered this infamous cheat, I sent a parcel to Mr. Phillips, of Craig's Court, to be analysed, and until that is done it will not be proper to give names; and therefore, while you may make what use you please of this, do not mention where it comes from. When the truth is ascertained, I feel it will be my duty, however much against my inclination, to make the fraud public. I know of no less than ten persons who have had this stuff to mix with acid, and of course the trial must fail, and the blame will be laid upon me. [*From a known correspondent.*]

Rats.—As a Mr. Meyer is making a secret of a poison for rats, I publish a cheap and efficacious one, recommended by the late Sir Humphrey Davy, as being tasteless, odourless, and impalpable (carbonate of barytes, 2 oz., mixed with 1 lb. of grease.) It produces great thirst, and death immediately after drinking, thus preventing the animals going back to their holes. To prevent accidents to dogs, cats, and poultry, it should be spread on the inside of an iron or tin vessel hung with wire, bottom upwards, over a beam, just high enough for a rat to pass under easily. I have proved the efficacy of this poison during many years, and have added many strong-smelling substances, without increasing my success.—*S.*

Potatoes.—Reading so many opinions in your invaluable journal on the cultivation of Potatoes, I was induced to try a method recommended a few weeks back, which was to set large whole Potatoes a yard apart; and in order, as I thought, to be sure of having a crop, each alternate row I planted large cut sets; the rows were 30 inches wide, and that it should not be said that the manure rotted the sets, I planted them without any. The result is, that I have fine strong plants from the whole sets, and more than one-third of the cut ones have rotted. A few of the last rows planted were smaller sets, and they have failed altogether; and I am obliged to plant them over again, and you may depend upon it I shall plant whole ones in their place. The soil is light and sandy. I have raked the soil nearly flat, and top-dressed with guano whilst we had the fine showers last week. I am now using the hoe to kill the weeds, which will cause the guano to drop amongst the roots, and shall then plough them up; the result of the experiment, if worth

your insertion, shall be forwarded in due course. The experiment is tried on an acre of ground.—*F. N.*

Ox-eyed Daisy.—In many parts of Surrey the meadows are quite overrun with this weed, and it communicates a most rank taste to the butter made from the milk of cows fed in the pastures where it abounds. There is too much of it to attempt to extirpate it successfully by hand-weeding, as many fields are quite white with the flowers, which expand about the same time at which the Grass crops become ripe. It is never, therefore, allowed to ripen its seed, and I cannot account for its having become so exceedingly prevalent in many districts where I have observed it. I have tried pasturing, draining, and manuring the meadows where it is abundant, but without materially weakening it. Perhaps some of your correspondents, who are unfortunate enough to be acquainted with this pest of meadow land, may have discovered some remedy for it, and there may be some manure, the application of which would tend to destroy it. Possibly lime might have a beneficial effect, but if any of your readers could suggest a method of destroying it, of which they have themselves proved the efficacy, it would confer a great benefit to make it generally known through the columns of the *Agricultural Gazette.—A Constant Subscriber.* [This weed appears to be unusually rank this year. Probably the only way of destroying it, except breaking up the pastures, is by keeping the Grass closely eaten down by cattle and sheep for a series of years. This would certainly weaken it, if it did not ultimately destroy it.]

Manures.—The desire to promote the science of Agriculture, is one of the "Lions" of the day. The steam is up, and some of us are fairly off on the search after new discoveries in this *terra incognita.* But others of us remain behind, and while our friends are gone on their voyage, let us do the best we may in their absence, and show them, on their return, that with the same soil, and with manures better arranged, and with materials found at home, we can compete with them, in our common object—production. We shall avoid the uncertain speculations in guano, nitrates, sulphates, &c., for these learned things, or rather names, mislead and perplex uneducated farmers; and the statements written respecting them tend to induce the belief that substantial or farm-yard manure is unnecessary. And then, as most of us have no knowledge of chemistry, we may spend our money for adulterated and useless matters, sold under specious names, to which they have really no claim. Even common salt, sold under the name of Agricultural Salt, is often anything but chloride of sodium, and the soot which is swept from our chimneys becomes, somehow or other, a mixture of soot and calcined sawdust before it is sold to the farmer. Good productive farming does not depend upon these things, so much as upon draining, deep and frequent ploughing, clearing the land from all other plants but those you desire to grow, early seeding, and last, but not least, preserving every decayed vegetable matter that can be found, either on or off the farm, and mixing it judiciously with the excrement of a well-selected stock of animals adapted to the character of the soil, preserving the mixtures in properly constructed yards and tanks. But, although I advise the farmer not to be led away by uncertain and delusive schemes, yet he should keep his eye open to the discoveries of wiser, because better educated men. You have repeatedly referred to the waste of some of our best manures, which could be arrested by timely care, and I shall close my note with a practical illustration of the saving of something to a profitable purpose, which is commonly overlooked and lost. The compost described below, I have seen extraordinary effects from in Turnip cultivation, but no doubt it can be applied to other plants with equal advantage. I shall describe a quantity applicable to one acre, either sowed broadcast or drilled in with the seed:—Put 8 bushels of crushed bones into a dry shed, and add from time to time, as they come to hand from the farm-house, or as they can be procured elsewhere, 24 bushels of ashes (wood are the best), and empty upon the mass, from day to day, the contents of the chamber utensils; to be stirred and mixed occasionally. At least 6 or 8 acres may be thus manured at a farm consisting of as many persons. Some of your chemical correspondents will, perhaps, explain the chemical changes which occur under these circumstances, and tell us what new compounds are formed.—*H. D., Witham.*

Tares.—I consider Tares to be as valuable a crop as the farmer can have, for, if grown properly, they are ready at a season of the year when an artificial green crop is most wanted. The land I have to grow them on is good Wheat soil, but still will not bring them at the time when most needed. Having sown some immediately after harvest in 1843, I found they did not make much progress, and therefore bethought myself of applying some kind of manure as a top-dressing, and on the 25th March, 1844, I sowed soot and salt broadcast in the proportions mentioned by C. Johnson, Esq., in his valuable publication on Fertilizers, viz., 30 bushels of soot and 8 of salt per acre, thinking that if beneficial for Wheat, it would most likely be equally so for Tares; but to my great disappointment, owing no doubt in a great measure to the unfavourable dry weather which followed in this part of the country, half the crop was destroyed, and it is now in a very poor plight indeed. Some self-sown Wheat, which happened to be left in the soil from the preceding crop, is growing very luxuriantly. The plan I intend adopting next season will be very different, and as follows:—Get the land ready as soon as possible after harvest, and drill the Tares in with some manure, which will help to force the crop; keep hoeing and watering with a liquid-manure cart in dry weather, if necessary, and by this means, the weather proving favourable, I hope to insure a good crop. Although mine was an unsuccessful experiment, it might answer on different land; but I would caution your readers to be careful as to the use of salt, and only try a small portion of ground at once; as many know, and I have found out by experience, what a deleterious substance it is when applied in too large quantities to the soil.—*Titus Oats, Nottingham.*

Yew.—On extensive pasture lands, near the summit of Birling-hill, two miles north of Town-Malling, Kent, are a great many old and several young Yew-trees. The cattle, sheep, and horses kept there have never suffered any ill effects from eating the green branches. About 18 years ago, a large tree was cut down in the winter season; the trunk and large branches were removed, and a few of the smaller ones used to fill up a gap in one of the hedges. A few days afterwards several bullocks and horses died, and on opening their stomachs a small quantity of the sere bark and leaves was found in each. The cattle seldom or never browse them when other green food can be found; indeed, during the spring and summer the farmers are careless about removing the trees or branches that may be blown down by the wind, as they never see that the sheep or stock will then touch them.—*W. P. Keane, Leybourne Grange.* [Another correspondent, "H. T.," states that the apparent want of agreement amongst the witnesses on this subject is owing to one party describing consequences which have followed when cattle have eaten Yew on a full stomach, while the instances recorded by the other party have occurred when Yew has been taken on an empty stomach.]

Rabbits.—Under the initial "C." I some time back made inquiry about the destruction of rabbits. For numerous replies from public and private correspondents I beg to return my best thanks. I have used many of the plans recommended. No information has been so conclusive as that from an "Old Poacher;" he recommends to get three or four dozen either polecats, martens, or young kittens just fit to take from the old cats, and turn them out in different quarters. Nothing will be more likely to destroy all the rabbits, game, or the rest of the gamekeepers.—*C.*

Rooks.—I must say one word in favour of this misunderstood bird and valuable farmers' friend. It is true they do sometimes attack the Corn, when it first appears above ground, but I believe they do not eat it before it begins to vegetate; and they amply repay the farmer for the damage they do to the sprouting crops, by the destruction of the larvæ of insects, which, were it not for the rooks, would do ten times as much injury. Many years ago I was drilling a field with Beans; the rooks were very numerous and busy, chiefly on the freshly-drilled ground. My ploughman was much annoyed to see them so actively employed, and insisted that they were devouring the Beans. Happening to have my gun upon my arm, I shot one to convince him of his mistake; on opening it, the crop was found full of the larvæ of the cockchafer, but not one Bean was to be seen in it! I would recommend your correspondent "Facile" to read the article on the Rook in Yarrell's "British Birds;" he would not then consider them useless to the farmer, because they do not destroy the Turnip-fly.—*Lusor.*

Nitrate of Soda.—Some time since I dressed three or four acres of old and new Grass with nitrate of soda, at the rate of 1 cwt. to the acre, as recommended by Mr. Grey, of Dilston. Notwithstanding the dry, harsh, and ungenial weather, the present appearance of the Grass, especially the new Grass, is very luxuriant, so much as to attract the attention of passers-by; and the experiment promises well. A neighbour of mine, an old farmer, however tells me that he tried the same experiment, and had a very good crop; but at the expense of his aftermath and subsequent crop. He therefore denounced nitrate of soda as impoverishing to the soil. Now, I am neither farmer nor chemist enough to argue the point with him, or to decide the matter for myself. It seems to me, however, that the argument is fallacious, for every good crop exhausts the soil, and the better the crop, the more complete the process of exhaustion. A farmer might as well lament having a good crop of Wheat or Turnips on the ground, because they were impoverishing his land. It seems to me that the proper way of meeting the difficulty is not to abstain from using that which will give a good crop, but to restore to the land the constituent elements of which the good crop complained of may have deprived it; and suppose this is a correct idea, my desire is to learn what is the best and most desirable mode of proceeding with land that is to be ploughed next spring for Oats, and which is now, thanks to nitrate of soda, bearing an exhausting crop of new Grass.—*S. L. B.* [The ploughing in of the Clover-root is generally sufficient surety for the succeeding Oat-crop.]

Steeping Seeds.—When I last wrote to you from Dorsetshire I promised to send you the analysis of Campbell's solution, or steep for Wheat. I distrusted my own skill in assaying, and submitted to Mr. Morson, in Southampton-row, a sample of the mixture. He writes—"This salt consists almost entirely of muriate and sulphate of ammonia, with a small quantity of iron and silica; but as all impure salts of this class are contaminated with iron, it may be regarded as a mixture of them in an impure state, in the following proportions:—

Muriate of ammonia	23 parts.
Sulphate of ,, ...	75 ,,
Iron, silica, and loss	2 ,,
	100 parts.

These salts being imperfectly mixed, it is probable some variation would be found in different samples." My own experiments prove that a solution of the nitrates of soda and of potash, sulphate of ammonia, and superphosphate of lime, in equal parts—1 lb. of the mixture dissolved in 1¼ gallons of water, acts more quickly, *i. e.*, produces a more rapid and darker vegetation than Mr. Campbell's.—*A. Huxtable.*

Swedish Turnips.—Knowing the value of Turnips at this season of the year, and particularly in the present year, when the Grass is still very short, I beg to say that I have Swede Turnips at the present moment (on which my cattle are feeding) perfectly sound, and I have nearly sufficient for another month. They have been kept by placing wattled hurdles at a cart's breadth apart, and sloping outwards at a gentle inclination, not lined with straw, which prevents a free circulation of air to permeate the heap, and carry off the damp vapours; the Turnips are then piled up as high as they will stand, and brought to an edge, and thatched after the heat has in great measure evaporated, placing only some loose straw on the top to keep out the heaviest rains. My heap was 40 yards long without a single unsound root. Mangold Wurzel I keep in the same way. I find great benefit at this time of the year when they are dry, from allowing the cut Turnips to stand for an hour or two in water, before being given to the cattle, as they imbibe a large portion of moisture.—*J. L. T.* [We can state from experience that this is a very excellent plan of housing roots, having this year had about 1200 tons of roots, Turnips, Mangold Wurzel, and Carrots, under this sort of cover, which preserved them well. We shall refer particularly to this subject at the proper season.]

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House, in Hanover square, on Wednesday last, the 19th of June; present—the Right Hon. Earl Spencer, President, in the chair; Duke of Richmond, Earl of Ilchester, Earl Beauchamp, Earl of Burlington, Earl of Lovelace, Lord Bridport, Hon. Colonel D. Pennant, M.P.; Hon. Capt. Spencer, Hon. G. H. Cavendish, M.P.; T. Alcock, Esq., M.P.; R. Archbold, Esq., M.P.; T. Baines, Esq.; D. Barclay, Esq, M.P.; T. R. Barker, Esq.; J. R. Barker, Esq.; J. Benett, Esq., M.P.; H. Blanshard, Esq.; Sir A. de C. Broke, Bart.; F. Burke, Esq.; Dr. Calvert; Col. Challoner; H. Colman, Esq.; J. Dean, Esq.; J. E. Denison, Esq., M.P.; B. Forrester, Esq.; A. E. Fuller, Esq., M.P.; B. Gibbs, Esq.; J. B. Glegg, Esq.; W. F. Hobbs, Esq.; Sir H. Hoskyns, Bart.; Sir J. Johnstone, Bart., M.P.; Col. Le Couteur; Sir C. Lemon, Bart., M.P.; Col. M'Douall; J. L. Naper, Esq.; Sir J. Ogilvie, Bart.; A. Ogilvie, Esq.; J. Parkes, Esq., C.E.; E. Parkins, Esq.; E. W. Pendarves, Esq., M.P.; Sir R. Price, Bart.; H. Price, Esq.; J. Roddam, Esq.; E. A. Sanford, Esq.; Prof. Sewell; J. V. Shelley, Esq.; R. A. Slaney, Esq.; R. Spooner, Esq.; E. Thomas, Esq.; T. Tweed, Esq.; and J. L. White, Esq.

The following new members were elected:—

Knight, J., Southampton
Gatrell, W., Lymington, Hants
Thoume, J., Guernsey
Edwards, R., Roby Hall, Liverpool
Parsons, G., Bursledon, Southampton
Martin, J., Evershot, Dorchester, Dors.
Raphael, L., Bushill Park, Edmonton
Buchan, H., Southampton
Hall, E. C. L., Emlyn Cottage, Newcastle-Emlyn, S. W.
Phillips, J., Lordship-lane, Tottenham
Betts, W., Leicester

The names of 23 candidates for election at the next meeting were then read.

The attention of the Council was called by Viscount Howick, through Mr. Shelly, to the best mode of collecting and publishing the numerous details connected with draining, and the cheap production of the most efficient tiles for that purpose; by Mr. Parkes, to the improvements effecting in the Benenden Pipe-tile Machine of Mr. Law Hodges, at the manufactory of Messrs. Cottam and Hallen; and by Messrs. Barrett, Exall, and Andrews, of Reading, to their invention of a new and cheap machine for the production of pipe-tiles.—Dr. Playfair, Consulting-Chemist to the Society, announced to the members the extensive arrangements he had made at Manchester, for analyses of soils at rates of one-half the amount of those he had formerly transmitted to the secretary for their reference.—Mr. Pellatt presented a new glass milk-pan, with an inner circular groove for the reception of the milk last left in the pan, agreeably with the suggestion of Sir John Lubbock; and announced his engagement in perfecting glass syphons for dairy use.—Mr. Frere, C.E., Bitton Rectory, near Bristol, presented a small supply of Neapolitan skinless Barley he had received by the last Mediterranean mail from a friend in Malta.—The Imperial Agricultural Society of Vienna, and the Royal Society of Agriculture at Caen, each presented to the Library of the Society a set of their respective volumes of Transactions.—The Royal Agricultural Improvement Society of Ireland transmitted copies of the prize sheets for their ensuing Show in Dublin; and Mr. Mechi, of Leadenhall-street, copies of the last report on his agricultural improvements in Essex.—Mr. Slaney presented Mr. Ford's new junction-tiles, made agreeably with a suggestion of Mr. Pusey. For all which communications and presents, the Council ordered their best thanks.

The Council then adjourned to Wednesday next, the 26th of June.

FARMERS' CLUBS.

Braintree and Bocking.—At a late meeting of this Society, Mr. F. Hobbs being in the chair, Mr. Smith, of Deanston, delivered a lecture on draining. After some general remarks arising from the occasion, he stated, that in the "Gentleman's Magazine," 150 years ago, there was a paper on the subject of draining in Essex, which described the work as parallel drains filled up with elm twigs, and which when opened fifty years afterwards were found to be sound. These drains were three feet deep and sixteen feet from each other. I think (said Mr. S.), draining was first introduced in Essex. I do not claim the invention, but I consider the merit to which I am entitled consists in directing the work to be done in a safer and more judicious manner. I first attended to the subject in Stirlingshire, where draining in the low lands had been introduced from Ireland. The character of this soil was alluvial, and of a very unproductive quality, and the drains were filled with turf and stones. I soon had opportunities of extending the practice to the upper lands, and of persuading my neighbours to adopt better plans of carrying out the work. I was subsequently examined by a committee of the House of Commons on thorough draining and subsoil ploughing, and perhaps I cannot better illustrate my views of these two important operations than by explaining a diagram which is intended to represent the soil of the field above the drains. The upper division is the soil affected by the common plough; the second division is the soil moved by the subsoil plough; and the lower, the soil undisturbed by either operation. Now in the old system of draining, to catch the surface water, the drains were cut across the hill; to point out the imperfections of this plan is one of the objects of my lecture. In an undrained state the cracks in the soil receive as much water as they will contain, but in heavy rains they are soon filled, and the superabundant water runs over the surface and retards early sowing in the spring, which is essential to productive farming, and it also unfits the soil for the safe reception of the seed. The purpose of thorough draining is, therefore, to get rid of the water rapidly, and to accomplish this, the distances of the drains, as well as their depth, must vary, according to the nature of the soil. Experience has pointed out that in impervious soils 18 feet is a good working distance, and it will be found that in extreme stiff clay, drains do not seem sufficiently to dry the land when first put down; the improvement in these cases is gradual, and may take several years, but the result is certain. Drains in these soils should be two feet and a half deep. In working strong soils it has been the common practice to work the ridges into a round form, in order that the water may escape from the surface, and run off in the furrows; by draining it is intended that the water should pass through the land, and this, I have no doubt, can be accomplished with certainty. If subsoiled and thoroughly drained, the clay cracks in the immediate neighbourhood of the drains —for clay contracts a sixth part of its bulk—which leaves openings for the water to pass down; you may trace these cracks in the intermediate spaces between and down to the drains; in dry weather for a long continuance these cracks are so extensive that the land becomes like a sponge. The admission of air carries on the process by its chemical action, and divides the soil into minute particles. In thorough-drained and subsoil-ploughed land, therefore, of whatever texture, the water readily finds its way through the furrow-slice into the subsoil, and from thence into the drains, and no longer passes over the surface. This may be called theory, but it is fact drawn from observation. I have examined the soil most carefully by a magnifying glass, to test the truth of this statement. But I must observe, that clay land when first drained is not like land of a more open texture, and caution is necessary in opening the subsoil. At Castle Howard some land of this description was subsoil-ploughed at the same time that it was drained, and the result was injurious; but when the subsoil plough was used from two to four years after draining, it was successful. In recent drains the water carries with it into the drains sediment, but in a short time it percolates through the soil into the drains in a pure state, leaving behind all matter held previously in solution. It has been thought by some that in strong adhesive clays the drains should not be more than from 18 to 20 inches deep. I say they should be deeper, or the water will be too near the surface. It is requisite to good farming that land should be worked early, and therefore the exit of water should be speedy. The feet of the horses do great damage to land that is charged with water near the surface; and therefore the deeper the water lies the less injury will accrue from this source. Air acts speedily upon the surface; as the water recedes into the soil, the air takes its place, and thus land deep drained is easily worked. The absorption of water by the atmosphere is much more rapid at one time than another, which one may witness by the rapid or tardy disappearance of vapour from the chimney of a steam-engine. Many suppose that on filling up a drain, the soil should not be put in close or firm, as it would prevent the water getting through it; this is contradicted by the practice of plug-draining. I say it is better to put in the stiff clay upon the pipe or tile than looser soil. The cracking of this stiff clay, if put directly upon the drains, facilitates the passing of the water into it; looser stuff will melt down, pass into the drains, and choke them. The clay should be put in a wet state over the drains. I have found two inches of sediment in the bottom of drains. The drains may be placed at greater distances if the land be subsoiled than otherwise. In the very adhesive clays, the stiffest I have ever known, the distance may be from 15 to 21 feet. There may be stronger clays in this county than I have seen elsewhere. Time is necessary to establish the full benefit of draining stiff soils: you must wait for two or three years for the full effect. I have known in Stirlingshire a progressive effect for 20 years in the conversion of strong lands into Turnip soil. In regard to the expense of draining, you have all a practical knowledge. In the strong clays of Scotland, the plough has been employed to 18 inches deep; even 30 inches have been opened by the plough with twelve horses and six men, which enables 36 yards to be taken out for 2d. upon a large scale; no spade is here used. Materials used for preserving the openings of the drains vary in different places. Stones are the best if small, but they require greater care, and often fail from mud getting in. Clay should be put over the stones, then straw put in on the wet clay as a close cover, and then filled up with common soil. Tiles, with or without soles, or pipes, are now extensively used; they should not be small, and great care should be exercised that they are sufficiently burnt. Circular tiles, with a sole somewhat concave, are preferred by some. I think them the safest. The water with such a bottom will clear itself better. Over the tile or pipe put stones, if you can get them, so as to prevent mud getting in. In the clay embankments of railroads the water gets into the cracks, and breaks down the embankment by dividing the clay. If the drain be kept open it is not of much importance whether tiles or pipes are used; if well burnt they are indestructible, and in all cases cover the drain with strong clay. Levelling is of great importance—in many cases absolutely necessary to safety. A very small fall will do; even one to four inches per mile is safe, (?) but have more if you can get it. After land is thoroughly drained it should be worked flat, without furrows. The margin of the furrow is always defective in produce. Experience teaches us this—that it should be flat, as you are sure to have equal benefit or injury from rain; and as water takes nourishment from the atmosphere which descends with the rain, it is thus distributed in equal proportions. And land is more easily worked flat, especially with a turn-wrest plough, and no injury occurs by the use of this instrument from the treading of the horses on the ploughed soil, which in all cases should be avoided. No stiff lands should be worked wet. With the turn-wrest plough you also get a quarter of an acre more ploughed per day.—After a long discussion Mr. Pattison moved a vote of thanks to Mr. Smith, which was seconded by the Rev. C. Blair Warren, and carried with great cheering. —*Chelmsford Chronicle.*

Darlington.—This Club held their monthly meeting on Monday last. The subject under discussion was the Best Method of Fallowing the Strong Clay Lands of the District, and whether it is desirable to break the Pan or Old Sole of such Lands in Fallowing. Mr. Walton, the Vice-Chairman, on introducing the subject, read to the meeting a very interesting paper, written and presented to the Club by Mr. George Davidson, now of Darlington, when a very spirited discussion followed. At the close of the discussion, it was unanimously resolved:—That it is better not to break the pan or sole to any great extent, either by subsoiling or otherwise, unless the land be first effectually thorough-drained, in order to carry off the water; but at the same time, deep ploughing, on the majority of strong clays, is considered highly advantageous, and is strongly recommended; bearing in mind always, that the first ploughing should be given in the autumn, or the beginning of winter, so that such parts of the pan or subsoil as may be turned up by that ploughing may be exposed to the frost; the land also to be thoroughly water-furrowed and gripped, and afterwards well cleaned and cultivated during the succeeding summer's fallowing. A vote of thanks was then awarded to Mr. Davidson for the valuable information which he has, from time to time, presented to the Club: and the subject fixed for discussion at the next monthly meeting, was fixed to be the Comparative Advantages of Stall and Pasture Feeding during Summer, for Draught Horses and other Cattle, with the best and most profitable Green Fodder for Stall Feeding.

Ardrossan.—After the Annual Cattle Show of this Society, a number of the members of the Society dined together at Irvine, Capt. Montgomerie, of Giffen in the chair. In the course of the evening the chairman stated it would be in the recollection of the members present, that, when making some remarks on the quality of rennet, at the meeting of the Society in November last, he had observed in the Transactions of the Highland Society, attached to the first Number of the new series of the "Journal of Agriculture," among some experiments on milk by Professor Traill, that he found sulphuric acid produced a much larger proportion of curd than rennet; and that, though late in the season, he (the chairman) would try the experiment on a larger scale, communicate the results, and submit the produce to be tested by the Society, which he now did, placing upon the table two small cheeses—the one made with sulphuric acid, the other with rennet. These cheeses, he stated, were made under his own inspection, of equal quantities of milk, and on the morning of two following days the curd was produced by the acid about seven minutes sooner than by the rennet, and that of the former much more solid than the latter. The proportion of acid used was that pointed out by Professor Traill, viz., 40 drops to a teaspoonful of rennet; but the result he had not found the same: on the 28th of December there was a difference in the weight of 11 oz. in favour of the cheese made by the rennet, and the same difference existed when weighed previous to sitting down to dinner. The rennet he could not a judge. He then cut up both cheeses, when that made by the acid was found to have a very unpleasant taste, in the opinion of some of the gentlemen, to an extent that must preclude the use of it; though a few were of a different opinion.

North Walsham.—At the Annual Meeting of this Society lately held, Mr. Gower, the Secretary, read the Report for 1844, from which we make the following extracts:—"The highly important discussion on the nature of soils was exceedingly interesting, being most ably introduced by Mr. Mann. The following is a brief analysis of the subject. The fertility of soils depends upon a due admixture of its various ingredients, a coarse gravel, a fine sand, and a powdery mass, consisting of various earths, and mouldering material, in the state of finest division; the relative proportions of these ingredients may be duly ascertained. Let 400 grains of dry soil be exposed to the heat of a spirit lamp in an earthen vessel, until a chip of wood is rendered black by charring, and its loss in weight will indicate the amount of moisture that had been united in an insensible state. Bruise the soil gently in a mortar and pass it through a sieve that will retain a Mustard seed; what remains in the sieve when weighed gives the proportion of coarse gravel and undecomposed vegetable fibre. Boil the powder for five minutes in a porcelain vessel with pure water, pour it into a narrow glass vessel, and in two minutes the sand will settle at the bottom, and the rest may be poured off diffused in the water. The sand dried in a porcelain vessel over the spirit lamp may be weighed to ascertain its proportion. Ascertain the weight of a paper filter. Place in it a glass funnel, and pour the solution in fine powder in; when the fluid has passed through, dry the filter, and having deducted its weight, the result is the proportion of the powdery mass; this is the most important ingredient, and contains the principal materials of nourishment for the plants. Rich clays consist merely of this fine powdery ingredient, with water, and an excess of aluminous earth. Fertile heavy soils should consist of at least one-fourth of this nourishing material, two-fourths of fine sand, one-fourth of coarse gravel and moisture. The amount of lime present may be ascertained by dissolving 50 grains of the fine powder in half a drachm of muriatic acid, and a drachm and a half of water, adding another ounce of water after three hours, then pass it through a filter and dry it, having deducted the weight of the filter; the loss of weight is the amount of carbonate of lime which was present, but now remains dissolved in the diluted acid, and the principle on the filter is aluminous earth. The proportion of animal and vegetable matter may be ascertained by exposing any known weight in a crucible to a red heat, the loss in weight will be the amount of organic matter which has been dissipated" . . . . "On the cultivation and manufacture of Flax, it was stated that from an acre of land, which produced four coombs of seed, 53 st. 8 lbs. of fibre had been scutched, and 7*s.* 6*d.* a stone had been offered for it. It was considered that had this Flax been pulled earlier, it would have been worth more per stone than it then was, would have produced more weight per acre, exhausted the land much less, and would have been off the land in time to sow Turnips for sheep-feeding." . . . . "In detailing the method which had produced the greatest weight of Swedes per acre recorded by the Club, the most striking peculiarity in the management of the crop was hand-weeding, or thinning the plants previous to their being hoed: when thus separated the plants take stronger hold of the ground; the best plants are easier selected by the hoers when cut across the drills. This crop having been grown on ridges at 27 in. distance, led to remarks on ridging and drilling on flat work; the latter system was supported only by few. It is evident, since this question was first discussed at the Club, there are many converts to the ridge system." —*Abridged from the Norfolk Chronicle.*

Maidstone.—At the late monthly meeting of this Society, the subject of discussion was the Cultivation of the Hop. The question, whether it was advisable to summer dig or nidget deeply, first came under consideration, and it was believed that deep and frequent cultivation was in all cases preferable. An interesting conversation followed on the nature and causes of mould, in which an almost ridiculous uncertainty as to the relations of cause and effect was observable. Almost every planter present adduced some instance where the mould had followed particular circumstances, but in almost every one of such instances, some other planter recollected where nearly similar circumstances had produced quite opposite effects. The members, after discussing the subject for a considerable time, unanimously coincided with the opinion which was quoted of a very old planter, namely that "he had lived a great many years and made a great many inquiries into the nature of the mould in Hops, and had only been able to arrive at certainty on one point, namely that he knew nothing about it." In the course of the evening several valuable hints were thrown out as to Hop Cultivation, amongst which were:—That stripping is not considered desirable, that bine should never be pulled from weak hills, but that such hills should always have a little extra manure given to them in the summer. That where a dead hill occurs it may be effectually supplied by training a bine in a trench underground to its poles from each of the neighbouring hills, which plan will give Hops on that hill the same year, and the runners being severed in the winter, the hill is filled up for the next. The following resolution was unanimously adopted:—"That deep culture and consequent pulverization of the soil is essential to the rapid growth of the hop, and although instances have been stated in which the neglect

of these has succeeded, yet they must be taken as the exceptions rather than the rule. That mould having been witnessed under all systems of management and after all sorts of manure, and the same systems having, in the same seasons, escaped, upon the same soils, no determination as to the causes can be come to, excepting upon some very strong instances given of its resulting after the use of rags. That many of the artificial manures recently introduced appear to have a stimulating effect upon the hop, but that the Club require further experiments to be made ere they can recommend their general adoption." It was then determined that the subject of discussion for the next monthly meeting should be—The best Mode of Employing, and Improving the condition of the Agricultural Labourer (of course apart from all political considerations,) and the best Mode of Breeding the Domestic Animals.—*Kentish Courier.*

We are much gratified to hear that these excellent societies are progressing in the county of Monmouth. On June 1st, a Farmers' Club was established at Usk, with upwards of thirty members—W. A. Williams, Esq., Chairman; T. Reece, Esq, Vice-Chairman; H. Phillips, Esq., Treasurer, and J. Knapp, Esq., Hon. Sec. At Abergavenny, on June 2nd, a large meeting of landowners and farmers met, Hanbury Williams, Esq., in the Chair, supported by W. H. Little, Esq., W. Williams, Esq., &c. The excellent Chairman, after briefly stating the importance to agriculture of farmers' clubs, proposed that a club should be established at Abergavenny; this being carried by acclamation, upwards of 60 members enrolled their names, and elected Hanbury Williams, Esq., Chairman; W. H. Little, Esq. Vice-Chairman; W. Williams, Esq., Treasurer, and W. H. Walbridge, Esq. Hon. Sec.

Miscellaneous.

Diseases of Wheat.—On the Bunt, Smut-balls, or Pepper-brand.—The fungus which occasions this well-known and much dreaded disease has hitherto been met with only in the grains of Wheat. Its presence is readily recognised by the peculiarly disgusting odour of the infected ear. It may be detected in the young seed, even in the very earliest states of the flower-bud; and when fully ripe it most frequently occupies the whole interior of the grain, but without bursting the skin, so that the Wheat seed retains very nearly the same size and shape that it would have assumed had it been perfectly sound. When examined under the microscope, the Bunt-fungus is seen to consist of vast numbers of extremely minute globules, of a dark-colour, and which are at first attached to a mass of matted thread-like matter, analogous to what is termed the spawn in Mushrooms, and other Agarics—and which in those plants spreads underground, and frequently occasions the remarkable appearances called fairy-rings. It is not easy to see this spawn of the bunt-fungus, but the little dark globules called spores, may readily be detected. They may be considered analogous to the seed-vessels of flowering plants, and each of them contains a mass of almost inconceivably minute sporules, by means of which the plant is propagated. The reproductive powers of fungi are quite beyond our comprehension. Fries, one of our greatest authorities, has calculated that a particular fungus may contain 10,000,000 sporidia.* Mr. Bauer has accurately measured the spores of the present species, and finds their diameter is not more than $\frac{1}{1800}$ of an inch. A single grain of Wheat (estimated at less than the $\frac{1}{1000}$ of a cubic inch) would therefore contain more than 4,000,000 such spores; but it is hardly possible to conjecture how many sporules each spore contains, since they are scarcely distinguishable under very high powers of the microscope, and then appear only as a faint cloud or vapour, whilst they are escaping from the ruptured spores. A reference to Mr. Bauer's plate and account of this fungus, in the "Penny Magazine" for 1833, p. 126, will furnish the inquirer with very accurate details of its structure and peculiarities. When this disease prevails, it greatly deteriorates the value of the sample; imparting its disgusting odour to the flour, it makes it less fit for bread; but I understand that ready purchasers are to be found among the venders of gingerbread, who have discovered that the treacle, and whatever else they mix up with it, effectually disguises the odour of the fungus; if this in itself is really innoxious, there can be no objection to such a mode of employing the tainted flour; but some are of opinion that it is to a certain extent deleterious. Although the bunt-fungus confines its attacks to the young seed, it seems to be a condition essential to its propagation, that it should be introduced into the plant during the early stages of its growth, and that its sporules are most readily absorbed by the root during the germination of the seed from which the plant has sprung. It has been clearly proved that Wheat-plants may be easily infected and the disease thus propagated, by simply rubbing the seeds before they are sown, with the black powder, or spores, of the fungus. It is also as clearly ascertained, that if seeds thus tainted be thoroughly cleansed, the plants raised from them will not be infected. This fact is now so well established, that the practice of washing or steeping seed Wheat in certain solutions, almost universally prevails. Upon simply immersing the grain in water, the infected seeds float, and on the water being poured off nothing but the sound ones remain in the vessel. This simple process, however, is never perfectly effective, because, in threshing the Wheat, many of the infected grains (smut-balls) are crushed, and the spores are dispersed in the form of a fine powder, which adheres with considerable obstinacy to the surface of the sound grains, by means of an oily or greasy matter found in the fungi. In order to detach them thoroughly, it has been considered useful to add some alkaline ley to the water in which they are washed; because oil and alkali unite and form a soapy substance, and then the spores will no longer adhere to the surface of the grains of Wheat. Lime, possessing alkaline qualities, has been long employed for the purpose. Common potash, and substances containing ammonia, as the liquid portion of stable manure, have also been used. But, as some persons employ brine, sulphate of copper, arsenic, and a variety of other materials which do not possess alkaline properties, it is supposed that all these solutions act rather by destroying the vegetative properties of the fungi than as a means of removing them from the surface of the grains. It may therefore be worth while to institute a set of experiments to determine which supposition is really correct. Perhaps some portion of the effect may be owing to the increased specific gravity of the liquid; or perhaps some portion of the solution may be imbibed by the steeped Corn, sufficient to prevent the sporules of the fungus from germinating within the substance of the plant; just as corrosive sublimate, essential oils, and Russia-leather prevent the formation of mouldiness. I may also add that the temperature at which the solutions are applied may be of some importance. *On the Smut or Dust-brand.*—This disease is produced by another fungus, which is often confounded with the last. The smut-fungus, indeed, resembles the bunt-fungus in colour and shape, but its spores are not half so large, and it possesses none of that disgusting odour which characterises the latter. Although this fungus is generally supposed to attack the grain much in the same way as the bunt-fungus, only that it more thoroughly destroys it, this is not the case. M. Ad. Brongniart has shown, in the "Annales des Sciences," vol. xx. p. 121, that the smut-fungus destroys the ear, by first occasioning the innermost parts of the flower to become abortive, whilst the little stalks (*pedicels*) on which these are seated swell, and become very fleshy. The fungus then consumes the whole of this fleshy mass, and at length appears between the chaff-scales in the form of a black soot-like powder. It is stated, however, by others, that it does not confine its attack to the ear; and though I have not myself witnessed its effects on other parts, it is described as infecting both chaff, straw, and leaves. The spores, when ripe, burst through the epidermis, and disperse in the form of a black powder, resembling charcoal. Mr. Bauer has given figures, and an account of this fungus also, in the "Penny Magazine" for 1833, p. 180. He there gives the dimensions of the fungus, by which it appears that the diameter of a spore is not more than the $\frac{1}{2800}$ of an inch. This disease is not so much dreaded as bunt, for two reasons: the spores have generally been dispersed before the Corn is cut; and even when present in the flour, they have no disagreeable odour. It is sometimes, however, very injurious, by diminishing the produce. It is comparatively rare in Wheat, but very common in Barley, and even more so in Oats; Rye does not appear to be subject to it. It has been observed in several Grasses, and I have this year noticed it in the common Oat-like Grass. (*Arrhenatherum avenaceum*). Like the bunt-fungus, so also may the smut-fungus be kept in check by carefully steeping the infected grain; but this process does not here appear to be so thoroughly effective as in the former case. Probably the earlier ripening of the spores causes the sporules to disperse in the fields, and so keeps up a greater out-door supply of them. If of two evils we might choose the least, it would certainly be more desirable that the Corn should be attacked by smut than bunt. I know not how an idea has originated, which I find prevalent among farmers, that a little smut in the Barley crop is a good sign; I can only suppose they mean to say the less the better. It seems to be most likely that both bunted and smutted Corn cannot be very noxious, as fowls which have been fed with them receive no injury. At the same time it is asserted that the straw of Corn infested with the smut-fungus is distasteful to cattle; but I am not aware that any experiments have hitherto been made with a view of ascertaining whether it is actually injurious to their health. *On the Precautions to be taken against Bunt and Smut.*—Whatever some persons may hope when they suggest the possibility of our effectually exterminating the bunt-fungus, provided a system of carefully steeping all seed Wheat were universally to prevail, the most sanguine calculations could never count upon the extermination of the smut-fungus with any prospect of success. Since the smut-fungus does not confine its attacks to Corn, but is also found in the Grasses which grow in pastures and by the road-side, a plentiful supply of sporules will always be kept up to warrant our believing that we shall never expunge this species from the British Flora. Still we may feel assured that precautionary measures may materially lessen an evil which cannot be wholly avoided. Since the sporules of the two fungi which produce bunt and smut enter the plants they attack by absorption at the roots, and since they are buried with those seeds to whose surface they have attached themselves, it is evident that too great care cannot be bestowed in procuring clean seed, or in purifying such as may accidentally be infected. From a variety of considerations, it has always appeared to me strange that practical agriculturists are accustomed to pay so little attention to the raising of pure seed-crops. There may be reasons, which I do not properly appreciate, that would render it inexpedient to cultivate a seed-crop apart from the rest of a produce raised on a farm; but I should have thought that it was always worth while for every farmer to set aside some portion of ground to be more carefully tended than the rest, for the purpose of securing good and perfectly clean seed. Among other reasons for such a practice, he would then be able to weed his crop from every plant infected with bunt or smut, before the fungi ripened. The benefit of steeping Wheat in some mixture or other, being thoroughly established, but it being still uncertain to what cause the success of this practice should be attributed, a few experiments might be undertaken, with a view to determine this point. These would tend to point out which of the numerous substances now in use were most likely to be really serviceable, and which of them might advantageously be dispensed with. I shall therefore venture to suggest, in the following sketch, the kind of experiments that may be called for; and they may readily be added to, or improved upon, by those who are willing to interest themselves in this inquiry. A parcel of thoroughly bunted or smutted seed should be divided into a number of small packets, each of the same weight; or if very small, each containing the same number of grains. When any of these packets are steeped or washed, the floated grains, and the fungi which rise to the surface, may be kept apart for separate experiments, being carefully labelled "F. 1," "F. 2," &c., to show that they were obtained from the packets of seeds, "No. 1," "No. 2," &c. by this process.

No. 1. Seeds unwashed, to serve as a comparative experiment.
— 2. Washed in cold water only—(2*) in scalding water.
— 3. Washed in water with lime, the proportions specified.
— 4. Washed in water and brine.
(a) Mixed in the proportion of 2 water to 1 saturated brine.
(b) " " " 1 " 1 "
(c) " " " 1 " 2 "
(d) Saturated brine.
— 5. Washed in sulphate of copper.
— 6. Sprinkled, but not washed, with lime.

Another set of experiments may be prepared with clean Corn, to be infected with the floated fungi obtained in washing the above.

No. 7. Rubbed with—
(a) F. 2, to serve as a comparative experiment.
(b) F. 3.
(c) F. 4.
(d) F. 5.

Another set may be prepared with clean Corn, which should first be steeped in different solutions, and then rubbed with the fungi obtained by simply washing in water (No. 2).

No. 8. Steeped in lime, and rubbed with F. 2.
— 9. " brine and do.
— 10. " sulphate of copper and do.

These last may be repeated by washing the seeds clean after they have been steeped, to remove any of the mixture that may adhere to the surface.

No. 11. Prepared as No. 8.
— 12. " " 9.
— 13. " " 10., &c.

—*Professor Henslow's Report, 2nd vol. of the English Agricultural Society's Journal.*

Fodder for Horses.—According to a five years' average of foddering horses, from the year 1825 to 1829, the following quantities are required to a head:—

	Oats.		Hay.	Mixture of 5 Hay & 3 Straw, cut into Chaff.		Worth of whole in Hay.
	Wt.	Worth in Hay.	Wt.	Wt.	Worth in Hay.	
Work-horse for a heavy train	10 lbs.	20 lbs.	12 lbs.	4 lbs.	3¼ lbs.	35¼ lbs.
Ditto for a light train	7·5	15	10	4	3¼	28¼
Stallion	6·5	13	10	4	3¼	26¼
Chaise-horses	6·5	13	10	4	3¼	26¼
3—4 years old	4·5	9	10	4	3¼	22¼
2—3 years old	3·75	7·5	8	3	2½	18
1—2 years old	2·5	5	7	3	2½	14½
½—1 year old	2	4	5	2·5	2	11

The lb. here is that of Bavaria, 5-6ths of the English lb.
—*Burger's Economy of the Farm.*

Effects of Manures on Turnips.—I prepared for Turnips a piece of five acres, of poor stiff clay, which would otherwise have in the usual round lain fallow, with 5 different manures of nearly equal value, and put on, on the same day and under exactly the same circumstances. The results are placed in the following tabular form:—

Acres.	Manure.	Produce.
1st	Ninety cart-loads of dung	300 bush.
2nd	Eight cwt. guano, at 12*s.* 6*d.*	640 "
3rd	One ton of rape, cost 5*l.* 5*s.*	460 "
4th	One ton of urate prepared by the London Company, which cost 5*l.* in London, being more than double the quantity they recommend per acre.	380 "
5th	Forty bushels ground bones, cost 5*l.* at Maidstone	480 "

Mr. Barnes, at the Maidstone Farmers' Club.—Maidstone Gazette.

The Turnip-Fly.—I ascertained, by accident, that the fly prefers other food to the Swede, and that the reason why it is more difficult to obtain a plant of Swedes than common Turnips is from being sown before other species, at a season of the year when commonly less rain falls than at a later period, and being slower in growth, and less able to withstand the attack of the fly. Over-feeding, whether from genial weather, excess of manure, or thick seeding, will commonly insure a plant: but sowing other seeds, as a decoy, is the most convenient, certain, and economical mode. The Turnip-fly abounds in woods, fences, and pastures. This, and some other facts relating to their nature and habits, I learned from the Rev. Mr. Kirby; and, acting on this information, I drilled thick rows of common Turnips as a decoy to catch them off, as practised by Mr. Paul, of

* The terms *sporæ*, *sporulæ*, *sporidia*, &c., have either been applied synonymously or vaguely by different authors. The most correct practice appears to be, to use *sporulæ* for the ultimate grains as analogous to seeds; *sporidia* for the cases or vessels containing them; and *sporæ* for an additional covering, which sometimes includes several *sporidia*.

Starston, some 35 years since. Catching the flies I found to be an endless job; besides, my land being bounded by woods on two sides, the flies so abounded that they destroyed the plants after being hoed out; but on leaving the thickly drilled decoy to feed the flies, I found they did not leave to feed on the newly-sown Turnips; and, in two instances, it appeared evident that the decoys I had sown, and left, saved the crop from injury, if not from destruction by the larvæ of the saw-fly—the black caterpillar. The decoys swarmed with both flies and caterpillars during the summer.—*Charles Poppy, in the Mark Lane Express.*

Experiments on the Cultivation of Turnips.—Perhaps it may not be yet too late to present our readers with the following report of some experiments instituted last year, by Mr. Peacock, at Popple, near Haddington, for the purpose of testing the comparative influence of certain manures and their combinations on the growth of Turnips, and which he has kindly allowed us to publish. The quantity of land allotted to each experiment varied from a rood to half an acre; but the following table has been calculated for the imperial acre. The tops and roots are not included in the results here given. The variety sown was the White Globe; it was sown in all the cases on the 10th of July, on a strong, tenacious clay soil, thorough-drained.

Manure per Acre.					Expense per acre.	Results per imperial acre.
Farm-yard dung, at 5s. per ton.	Guano, at 11s. 6d. per cwt.	Bone-dust at 2s. 4d. per cwt.	Rape-dust at 5s. 6d. per bushel.	Gypsum at 3s. per cwt.		
					£ s.	tons. cwt.
—	3½	—	—	—	2 0	13 5
—	1¾	8	—	—	1 18	13 16
—	1¾	—	—	2	1 6	15 15
—	—	—	—	4½	0 13	12 14
—	1	5	2½	—	1 16	12 2
10	—	—	—	—	2 10	9 12

The above statement is by no means submitted to the public as examples of extraordinary, or even average produce, the entire crop—from being too late sown, and other causes—having been a very deficient one; but merely for the purpose of illustrating the comparative efficacy of the manures and combinations employed, so far as may be inferred from the results of these experiments. The first five lots were ready for thinning a week at least before the other Turnips sown in the same field, on the same day, and manured with the usual allowance of well-fermented farm-yard dung. The tops presented from the first a very dark-green colour, visible from a considerable distance, maintaining throughout superior luxuriance, and, when cut from the bulb, were at least double in quantity compared with those on the other Turnips. It may be worth mentioning, that the bulbs produced by the "fertilisers" weighed very considerably heavier in proportion to their size than those grown with the dung. It may also be useful to observe that the land experimented upon has, during Mr. Peacock's 14 years' occupying of it, always failed in growing Clover—a circumstance which may, in some measure, account for the comparatively large produce of lot No. 4, manured with gypsum (sulphate of lime), and has induced the present spirited and intelligent tenant to give it a further application of gypsum as a top-dressing to the Barley now growing, with the view of promoting the growth of that most invaluable plant, Clover.—*Berwick and Kelso Warder.*

Jamaica.—At the monthly meeting of the Agricultural Society, you were appointed corresponding Member of the Society. You will be pleased to learn that the Queen has been graciously pleased to signify her consent to become its patroness, and to command that it be in future called "The Royal Agricultural Society of Jamaica." Lord Stanley, too, has become a life member; and the happy manner in which all this was communicated to the meeting by Lord Elgin, with his intention of following so good an example, induced our worthy Bishop to come forward, and declare his desire also to become a life member; and at the same time he exhorted the clergy, many of whom were present, to support by all means in their power a Society calculated to work so much good. This brought Admiral Sir Charles Adam on his legs, who announced his intention to become a subscriber also, and he was subsequently elected a Vice-President of the Society. I am sure you will agree with me, that this Society, so honoured by the distinguished mark of her Majesty's Royal favour, is calculated to be of immense advantage, not only to Jamaica, but the West India Colonies generally; and I therefore hope you will lose no opportunity of bringing it before the public, and of urging, as much as lies in your power, proprietors and others, connected with Jamaica property, to support it by their subscriptions. The proprietors in England of Jamaica estates are doing very wrong in throwing them up, as they are doing to an alarming extent; it would be much wiser in them to rent them out, even at a peppercorn rent, to practical men in the island, in order to keep up the cultivation to some extent until the crisis has passed; for, as you know, an estate once abandoned can only be brought back into cultivation at a very heavy charge. We who are resident in the island, with our good governor at the head, have determined to use every effort to restore prosperity by the introduction of new and improved systems of Agriculture, and there cannot be a doubt of our success when it shall please the Almighty to visit us with rains.—*Simmonds' Colonial Magazine.*

The Benenden New Tile Machine.—In a recent Number we mentioned a new tile-making machine, for which the agricultural world are indebted to T. Law Hodges, Esq., at Benenden, assisted by Mr. K. Hatcher, a self-taught potter and tile-maker, of considerable scientific qualifications and practical knowledge. We have since had the gratification of inspecting this machine at work; and as it possesses many points of improvement over any other which we are acquainted with, a slight notice of it will not perhaps be unacceptable to our agricultural and scientific readers. The more recent tile-making machines are all constructed on the principle of forcing the clay, in a properly tempered state, through a die fixed in an iron box, so that it may come out, if the expression may be allowed, in a continuous stream of pipe, which is then cut off to the proper length for forming separate tiles. The clay must, of course, be completely mixed and amalgamated in a pug-mill; and when, as in Mr. Etheridge's, the die was fixed to the bottom of the pug-mill, the operation appeared reduced to the greatest degree of simplicity of which it is susceptible. The machine constructed by Mr. Reid is also exceedingly simple: but this, like Mr. Etheridge's, is stationary, which is found in practice to be comparatively disadvantageous. The tiles having to be dried by exposure to the air for some days before they are burnt, must be taken by the hand from the stationary machine, placed on barrows, wheeled to the shed, and again taken from the barrows and placed in piles. As the sheds under which these piles of raw tiles are placed are upwards of 100 ft. long, in order to transfer the raw tile at one motion from the machine to the rows of piled tiles, the machine must of course move along the rows from one end to the other. This is done by the Benenden machine, which we will now describe. This implement has the appearance of a form about 18 inches wide and 10 ft. long, standing between two upright battens near to one end. On the form, and between these two uprights, is a square iron box, in one side of which are placed the dies from which the stream of pipe rolls out on to the form. Fitted into the top of this iron box is an iron cylinder, having a close iron grating or sieve to intercept small stones or grit at the bottom of it. This cylinder, being charged with tempered clay, is placed on the iron box. A piston, worked by a toothed rack and pinion and common winch, presses the plastic clay down from the top through the dies, three continuous lengths of pipe, 1¼ inch bore, emerging thus at one time. This pipe is too soft to admit of being pushed along the form, so it is assisted by an endless web, on which it falls from the dies, and the pace of which is regulated by the supplying power of the machine. As the rolls of pipe progress along the form, portions of the end of it are continually cut off, of the proper length to form one-foot tiles. The instrument by which this is done consists of a small round staff, which is inserted into the orifice of the pipe, and on which the tile is carried away after being cut off by a piece of fine wire, ingeniously attached to the staff. The shed in which the machine works is about 108 feet long, and of sufficient width to admit of the machine being wheeled along in the centre, and of a boy to work on each side of it, in removing the tiles from the machine, and placing them in a row along under each side of the shed. The *modus operandi* is this: A stout lad brings a cylinder charged with prepared clay, and having received a cylinder, and emptied and cleaned all the grit from its grating, proceeds to fill that in the same way. A man turns the winch with his right hand, assisting the pipe as it issues from the die with his left. If a piece of grit, or a "nub" of rather harder clay affects the shape of the emerging pipe, the piece is severed and carried away into a basket by the endless web, and a new issue of perfect pipe proceeds from the die. During the issue, the two removing boys are kept in full activity. It is estimated that a man and three boys will thus make 5000 tiles per day, and that the price at which they can be sold will not exceed 15*s.* per thousand for those of 2 inches bore, and 14*s.* for those of 1¼ inch bore. The greatest advantage of the plan probably consists in the readiness by which the machine and the pug-mill may be transferred from place to place. Both together may hereafter be purchased for about 24*l.*, and any considerable farmer or landlord will doubtless find it cheaper to make his own drain-tiles than to buy them, as the cost of carriage has hitherto been a serious item. This improvement must prove of incalculable advantage to the Weald, the clay of which, after lying long in clods in the sun, rings like stone or earthenware when struck with a hard substance, and is exceedingly stiff and retentive of moisture. —*Maidstone Gazette.*

The Alpaca of Peru.—We observed in a late Number of a periodical, that there was some expectation of introducing the Alpaca into this country on a large scale, for the purpose of wool-gathering; but an objection was raised, because, besides other adverse circumstances, the climate of Great Britain and Ireland was unsuitable. We beg to disabuse the public mind on this subject, as there can be no doubt as to the climate being suitable, the difficulty not being in the climate, but in the meantime to get these animals into this country in a healthy state. They continue very healthy, we are informed, until they reach the Cape of Good Hope, but after being a very little longer at sea (either from being so long at sea, or some defect of physical strength) they droop and die—at least to the extent of two-thirds. Some method might be adopted whereby they could be put on shore for a time at the Cape, and re-embarked into a succeeding vessel. But be this managed as it may, we have seen a male and female of the Alpaca species at Craigbarnet, Lennoxtown, Stirlingshire, which have been there for the last eight months, and they have stood the severe winter without injury, and we are assured are more hardy than our native sheep: they require less food, and could exist where sheep would die. There seems hardly to be any kind of food they will not eat; they eat Turnips, Hay, Oats, and Beans; they are more partial to meadow than Rye-grass Hay. These animals are now in the highest order, and in the most perfect health; they are jet black, and follow their keeper like a dog, and are very elegant and interesting. The weight of the fleeces of last year was 17½ lbs. Their worthy owner, to use his own words, "anticipates, when the navigation between us and South America is diminished as to the length of time, which steam will most assuredly accomplish, thousands of Alpaca will be brought over—our hills will be covered with them, and they will become a source of great wealth to the proprietors and farmers of the Highland districts, for these animals will thrive upon that kind of coarse bent, which neither horse, nor cow, nor sheep, will look at or touch."—*Edinburgh Witness.*

Experiments with Nitrogenous Manures.—At a meeting of the Chemical Society, a paper was lately read, containing a report of some experiments with saline manures containing nitrogen, conducted on the Manor Farm, Havering-atte-Bower, Essex, in the occupation of C. Hall, Esq., communicated by W. M. F. Chatterley, Esq. The experiments were suggested by the prevailing opinion, that the fertilising power of some animal manures, and of the salts, nitre, (nitrate of potash,) nitrate of soda, and sulphate of ammonia, depend upon the proportion of nitrogen they contain. * * * A field of Wheat was chosen, which, in the latter end of April, 1842, presented a thin plant; the salts were top-dressed over the land by hand, on the 12th of May, and the crop mowed on the 10th of August. The soil was rather poor, consisting of a heavy clay upon a subsoil of the London clay. 1. No manure; corn per acre 1413 lbs. 2. With 28 lbs. of sulphate of ammonia; corn, 1612 lbs. 3. With 140 lbs. of the same salt; corn, 1999 lbs. 4. With 112 lbs. of nitrate of soda; corn, 1905 lbs. 5. With 112 lbs. of nitre; corn, 1890 lbs. The increase in the Straw was also considerable in all cases, except with the small proportion of sulphate of ammonia. The total increase in the four manured crops was per cent,. in the order in which they were enumerated,—14.1, 41.5, 34, and 33.5. The cost of the manure for the three last did not greatly differ, being 21*s.* 9*d.*, 24*s.* 6*d.*, 27*s.* 6*d.*; and the profit on the outlay was, with the small dose of sulphate of ammonia, 294 per cent.; with the large dose, 212 per cent.; with the nitrate of soda, 138 per cent.; and with the nitrate of potash 92 per cent. The principal conclusions drawn by the author are, that the increase of nitrogen in the crop is greater than is accounted for by the nitrogen of the manures, showing that these manures have a stimulating effect, or enable the plants to draw additional nitrogenised food from the soil and atmosphere; the considerable superiority of sulphate of ammonia over the other salts, and the greater proportional efficiency of a small, than of a large dose of that salt.—*Smith's Productive Farming.*

The best Comparison of the Old and New Scottish Systems that we know of, is that of Mr. Oliver, of Lochend, near Edinburgh, who has the reputation of being one of the best practical farmers in the realm. The acre he speaks of is the Scotch acre, about 1¼ acre English. A Scotch boll of Wheat is nearly 4 bushels, and of Barley nearly 6 bushels. "The mode of cropping at the former period (1723) was—first, Peas; second, Wheat; third, Barley; fourth, Oats; the produce being about three seeds, but to prevent all cavil, say four seeds. This, taking the seed for each acre at one boll, over a farm of 100 acres, is 400 bolls. The quantity of straw for each boll of such a crop could not exceed 15 stones; which, on 400 bolls, gives 6000 stones, or 42 tons, 15¼ cwts. of straw to be consumed by the stock, and returned to the land in the shape of manure. But, upon a farm of 100 acres, cultivated as at present, viz., a fourth Turnips, a fourth Wheat or Barley, a fourth Clover or Rye-Grass, pastured or made into hay, and consumed on the spot, and a fourth Oats or Wheat, the account would stand thus:—50 acres of Wheat, Barley, and Oats, at eight bolls an acre, which is not above the average of the crops of the best district of East Lothian, and such only was cultivated when Lord Belhaven wrote; this, allowing, as before, 15 stones of straw for each boll, gives 120 stones per acre, which, over 50 acres, makes in all 6000 stones of straw, being equal to the quantity produced by the whole 100 acres under the old system. Now, suppose that the 25 acres of Clover and Rye-grass are made into hay, which, however, is not the best mode, nor that usually followed, and that each acre yields 200 stones, the total quantity will be 5000 stones, or 35 tons, 14 1-10th cwts., and add to this 500 tons Turnip, being the produce of 25 acres at 20 tons per acre, which is by no means above a fair average crop. Upon these data, the weight of the materials produced annually as food for cattle and manure, under the old and new systems, will be as follows:—

Old System,	Straw	6,000st.	or 42	tons.
New System,	Straw	6,000	,, 42	,,
	Hay	5,000	,, 35	,,
	Turnips	70,000	,, 500	,,

Thus making the weight of materials for food and manure under the new system, in round numbers, 577 tons; while, under the old system, the quantity is only 42 tons, leaving a balance in favour of the new of 535 tons per annum, being more than twelve times the whole quantity produced under the old! Nothing more is necessary to show the superiority of the new system, in so far as keeping up the fertility of the soil is concerned, and upon this depends the progress of Agriculture. As

to the question of comparative profit, it would be easy to show, from unquestionable data, that the new system is as superior to the old in this respect as it is in the supply of manure; but this must be abundantly obvious to every one who contrasts the almost imperceptible advances made in Agriculture, and in the accumulation of agricultural capital, for many centuries, with the extraordinary progress during the last 50 or 60 years, or since the new system began to be introduced."—*Kentish Courier.*

Notices to Correspondents.

AMMONIA.—*T. R.*—The usual mode of obtaining ammonia from animal matter is by destructive distillation. *E.*

BRAN.—*H. Lawson.*—Can any one inform our correspondent where an analysis of Bran is to be found?

COATES'S HERD-BOOK.—*W. Sadler.*—Can any one inform our Correspondent the terms of admission of Cattle into "Coates's Herd-book?"

DRAINAGE.—*Subscriber.*—It is well to place soles the whole of the way under the draining-tiles.

DRILLING CORN.—*Querist.*—The advantages of this practice lie in the capability which it confers on you of cleaning the land during the growth of the crop. The plants would necessarily grow better were the seed sown at equidistant intervals in every direction; but the necessity for hoeing and cleaning the land requires that the intervals be widened in one direction; and therefore, that the quantity of seed sown may be sufficient, it also requires that the intervals be diminished in the other direction: hence the *rationale* of drilling. You must keep your land clean; but for this, hoeing is an injury in this hot weather.

DANIELL'S MANURE.—*J. Wharton.*—Please to give us your address.

GUANO.—*T. Wade.*—The quantity you applied should have secured you a crop the second year, and, had it not been such weather, probably would have done so.

LAWNS.—*R. A.*—There is a machine for mowing lawns which goes under the name of Budding's Mowing-machine.

MANURES.—*B. L.*—If no ammonia is given off on boiling any substance in a caustic alkaline solution, it is plain that no salts of ammonia are present in it. There is usually a quantity of ammonia in wool, chiefly derived from the perspiration of the animals; this ammonia would be lost by boiling the wool with alkali. Ammonia is generated when animal matters decay, or are decomposed in any manner; by boiling wool with alkali, it would be more or less decomposed, a portion of ammonia would be formed, and lost in consequence of its volatility under those circumstances. *E.*——*Wm. B.*—The sum of 15*s.*, charged by Mr. Karkeek as expenses connected with the use of town manure, includes not only the spreading of it on the land, but the mixing, turning, &c., which it received previous to spreading.

NOTICE TO QUIT.—*Ox-noble.*—The case of our correspondent is a hard one: but (assuming that the notice to quit is correct in point of form, and as to the parties by whom it is given) there can be no doubt but that he must give up the land at the expiration of the six months. He is of course aware that a notice to quit, to put an end to a tenancy from year to year, must expire at the same time as the current year of the tenancy; *e.g.*, if the tenancy commenced at Michaelmas, the notice must be given to quit at Michaelmas, and not at any other period of the year. *W.*

PULVERISING CHALK.—*R. T.*—Will the notice in last week's paper answer your purpose?

RATS.—*Several* inquiries have been addressed to us about Mr. Meyer's mode of destroying rats, his terms, &c. Perhaps this notice may result in eliciting the required information.

SMALL FARM.—*A Lady* had better sow half an acre to Mangold Wurzel, half an acre to Carrots, half an acre to Wheat with Clover, half an acre to Wheat without Clover, the stubble of which may be broken up and sown to Vetches, which may be mown for the cows in spring, the land being planted to Potatoes; and a quarter of an acre to Cabbage, Potatoes, &c. Litter and food will thus be provided for two cows.

THISTLES.—*G. L.*—Persevere in pulling them, cutting them off, &c.; and ultimate success in extirpating them is inevitable.

MISCELLANEOUS.—*W. P. T.*—We have sent your letter to Professor Henslow. Have patience, and you will not be disappointed.

***As usual, many communications have been received too late.

Markets.

SMITHFIELD, MONDAY, June 17.—Per stone of 8 lbs.

Best Scots, Herefords, &c.	3s	8 to 3s	10	Best Downs & Half-breds	3s	8 to 4s	0
Best Short Horns	3	4	3	8	Best Long-wools	3	6	3	10
Second quality Beasts	2	10	3	2	Ewes and second quality	3	0	3	6
Calves	3	8	4	2	Lambs	4	4	5	0
Pigs	3	4	4	0					

Beasts, 2752; Sheep and Lambs, 24,150; Calves, 204; Pigs, 361.

Our supply of Beef to-day is somewhat smaller than last week; still, there is a large quantity, and it is difficult to get a l sold. The demand, however, has improved, and our top quotations are more freely given; the best Scots readily make 3s 10d, and Short-horns 3s 8d per 8 lbs. Middling qualities are a heavy trade, and there is no advance in the price of that description. Sheep are also in less quantity, and the demand rather increased; still it is difficult to obtain an advance in price, and our highest quotations are not generally supported, many of the best Downs, &c., being sold at 3s 10d, and the best Longwools at 3s 8d; Half-meated Sheep are heavy on hand, the buyers of that description being, for the most part, kept out of the market by the continued dry weather. Lamb is a steady trade, rather more in demand. Veal-trade is remarkably heavy—many very good Calves make no more than 4s. Pork-trade is heavy.

FRIDAY, June 21.

Fresh Beasts are not very plentiful to-day, and trade is rather brisker. Our top quotations of Monday are well supported, and in some few instances there is a little advance; the few refreshing showers since Monday, and a shorter supply to the dead market, have improved our trade for both Beef and Mutton. Although there is a fair supply of Sheep, there is more demand, and the best Downs, &c. of moderate size, readily make 4s, and Longwools, not too large, 3s 10d per 8 lbs—the weather being warm; big fat Sheep are very unsaleable, and make no more than from 3s 6d to 3s 8d per 8 lbs. Lamb is about the same as on Monday. Veal is a shade better, some of the best Calves making about 4s 4d per 8 lbs. The warm weather makes Pork-trade heavy—very neat Porkers barely make 4s per 8 lbs.

Beasts, 517; Sheep and Lambs, 11,970; Calves, 448; Pigs, 333.

41, West Smithfield.

POTATOES.—SOUTHWARK WATERSIDE, June 17.

THE weather continues very dry, and during the past week sultry hot, the wind being generally south-west, without any appearance of rain. This market has been supplied since our last from the northern districts, also from Devonshire and the Channel Islands; but in consequence of the drought, a further advance was obtained on the Late Devon Reds, and also on some of the best samples of the York Reds; but the dry-rot being apparent in several samples of the Perth Reds, our last quotations have not been fully maintained. Foreign Whites are still selling from 55s to 70s.

York Reds	-	-	-	90s	to 110s	Essex and Sussex Blues	—s to —s
Perth	-	-	-	80	90	Wisbeach Kidneys	— —
Early Devons	-	-	-	—	—	— Blues	— —
Late Devons	-	-	-	95	105	— Whites	— —
Cornwall	-	-	-	—	—	Jersey and Guernsey Blues	75 80
Sussex Whites	-	-	-	—	—	Prince Regents	— —
Kent and Essex Kidneys				—	—	York Shaws	— —

WOOL.—BRITISH, FRIDAY, June 21.

Our market continues steady; an average amount of business, for the season of the year, is being done. The Staplers complain much that the high prices the Farmers at present demand for the new Wools prevents their buying any large quantity.

	per lb.				per lb.

Southdown Fleeces	11½	1 0				

JAMES PERRIN, Wool Broker.

HOPS, FRIDAY, June 21.

THE accounts from the Hop plantations have continued to come worse during the week, speaking of a general increase of vermin throughout Sussex, Weald of Kent, and Worcester; Midd. Kent as yet is only partially attacked with fly, but mould has already shown itself in several places; the market, in consequence, has advanced 2s to 4s on last week's prices

PATTENDEN & SMITH, Hop-Factors.

MARK-LANE, MONDAY, June 17.

THERE was a short supply of English Wheat at this morning's market, and the trade ruled exceedingly heavy; sales were effected with much difficulty, on about the same terms as last Monday. Foreign met a moderate demand at our quotations. Low heavy descriptions of Bonded met a slight inquiry at 34*s.* to 35*s.* per qr., for export to France.—Barley must be noted 1*s.* higher, and Foreign f. o. b. continues to find buyers at rather improving rates.—Beans sell freely, at last week's Prices.—Peas, both White and Grey, are 1*s.* dearer.—The Oat-trade is good, and fine qualities command an advance of 6*d.* to 1*s.* per qr.

FRIDAY, June 21.

The arrivals of Wheat, both English and Foreign, since Monday, have been good; although the quantity offering on sale is moderate, the trade has ruled dull, and sales were limited at that day's quotations. The weather, having been showery throughout the country, appears to have affected the demand for Spring Corn, in which there is little doing to day; but we observe no alteration in the value of Barley, Beans, or Peas.—The Oat-trade is heavy, and Monday's advance barely maintained.

KINGSFORD AND LAY.

COVENT GARDEN, JUNE 22.—The market has been well supplied with Fruit during the week. Pine Apples are both good and plentiful. Among them were some excellent specimens of Providence and Queens. Grapes are also good in quality, and have been abundantly supplied. Peaches and Nectarines are considerably reduced in price since our last Report, as are also Melons, the best specimens of which are offered at about 7*s.* each. Cherries, both from Standards and from the wall are abundant. Strawberries are very good and plentiful, and they are becoming cheaper. The market is now well supplied with Gooseberries, many of which are now getting ripe; Currants are less abundant, Vegetables are, generally speaking, still inferior, owing to the long dry weather. Spinach is scarcer and dearer, in consequence. Carrots and Turnips are also affected by the drought; Cauliflowers, however, are large and fine, and Asparagus is good and sufficient to meet the demand. Rhubarb has not altered in price since our last Report. French Beans are a little reduced in price. Peas are supplied in large quantities at last week's prices. Lettuces and almost all kinds of Salading are abundant. Cut Flowers chiefly consist of Heaths, Pelargoniums, Gardenias, Pinks, Lily of the Valley, Sweet Peas, Fuchsias, Verbenas, Cacti, Moss, Provins and other Roses.

FRUITS.

Pine Apple, per lb., 4*s* to 10*s*
Grapes, Spanish, per lb., 1*s* to 1*s* 6*d*
Hothouse Grapes, per lb., 3*s* to 7*s*

LIQUID MANURE.

ENGLAND INDEPENDENT OF THE WORLD FOR CORN.

THE attention of the Agricultural Interest, at this momentous crisis, is requested to the great importance of LIQUID MANURE, and the ease with which it may be appropriated, by the use of FOWLER'S PUMPS, made expressly for the purpose, either portable or fixed; Garden, Ship, and Barge Pumps; also, those for Distillers, Brewers, Soap-boilers, and Tanners, for hot and cold liquor. Pumps kept for hire, for Excavations and Wells. Buildings heated by Hot Water, for Horticulture, and every variety of manufacturing purposes.

The Trade supplied on advantageous terms, by BENJAMIN FOWLER, Engineer, &c., 63, Dorset-street, Fleet-street, London

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5*l.* to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—EDWARD PURSER, Secretary, 40, New-bridge-street.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

HAYMAKING SEASON.—Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and all Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

KEENE'S PATENT MARBLE CEMENT.—This CEMENT is particularly adapted for the Walls and Floors of Conservatories and Greenhouses, being calculated, from its extreme hardness, to resist the wear incident to ordinary Plastering. For Floors it has a threefold advantage over Stone-paving. 1st, in its lightness; one inch in thickness of KEENE'S CEMENT sufficing where 2 to 3-inch flagging would be employed. Next, in its appearance, combining, as it does, the hardness of stone with a uniform colour and even surface free from joints; and lastly, in economy, being one-third the price of Portland paving.

The most conclusive evidence can be given of the utility of KEENE'S CEMENT for these purposes by the Patentees and Manufacturers.—JOHN BAZLEY WHITE and Sons, Milbank-street, Westminster.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

DR. HALLETT'S LIQUID FERTILISER.—The beauty of Flowers, with their power of perfecting their Seeds, and the flavour and size of Fruits and Vegetables, must ever depend upon the food supplied to the plants producing them, and these a very extensive series of trials on various soils has shown, may be secured by the use of Dr. HALLETT'S CONCENTRATED LIQUID FERTILISER, which contains all the essential ingredients of the best foreign Guano, with others equally so, but not to be found by Sea Fowl, in the Atlantic Ocean. Sold at Mr. G. HALLETT'S Factory, Broad Wall, Blackfriars; Messrs. WINSTANLEY'S, Chemists, 7, Poultry; Messrs. WARNER'S, 28, Cornhill; Messrs. HURST and M'MULLEN'S, 6, Leadenhall-street; and every respectable Chemist's and Seedsman's, with directions, in stone quarts, at 1*s.* 6*d.* each, and in bottles, six times the size, at 7*s.* 6*d.* The quart requires 32 gallons of water to reduce it for use, for watering soils and growing bulbs

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. LAWES' Factory, Deptford Creek, price 7*s.* per cwt. Phosphate of Potash, 15*s.* per cwt.
" Soda 12*s.* "
" Magnesia 9*s.* "
" Ammonia 1*s.* per lb.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to JAMES CLARK, 24, Billiter-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

WM. NORTHCOTT, 13, Rood-lane, Fenchurch-street.

GLASS SUPERSEDED FOR HORTICULTURAL PURPOSES BY

WHITNEY'S CHEMICAL, TRANSPARENT, WATERPROOF COMPOSITION, for rendering Muslin, Calico, or Linen, for the Frames of Greenhouses, Pine, Melon, or Cucumber Stoves, &c., impervious to Rain or Moisture, admitting light equal to Glass, the *burning* rays of the *sun alone* being obstructed. Houses or pits covered with Calico, &c., prepared with this Composition, embrace important advantages over Glass. The light being equally diffused in every part of the house, plants placed on the floor have as much light as those close to the covering, consequently they are not drawn up as under Glass, while they continue much longer in *bloom*, and preserve their *delicate tints unfaded* till the *blossom falls*.

Whitney's Substitute for Glass.—I have had screens of calico rendered transparent with Mr. Whitney's invaluable varnish, and used them last winter, with a success far exceeding my most sanguine expectations, though my anticipations had been considerably excited. Indeed I consider Mr. Whitney's discovery as an invaluable boon to the horticulturist, one that will bear competition with any invention connected with the art and mystery of Horticulture in modern times. My screens were about 9 feet long each, and were inclined to the wall separated about 12 inches below, and as my object was to ascertain the value of the screens, in reference to *radiation*, they were *left open at each end*. Suffice it to say, the Fuchsia, Pomegranate, Passion-flower, Japan Honeysuckle, and others still more delicate and susceptible, were effectually preserved, and that without the slightest check to their growth, or any injury whatever. I am of opinion that in this *new aspect*, it possesses a protecting influence *infinitely superior to glass*, because the effects of radiation, a most powerful source of cold, are *not intercepted by glass*, which so materially counteracts the artificial temperature within; I cannot, therefore, but conclude, that for the protection, not merely of the early blossom, but the maturation of the fruits as in the case of the Peach, Nectarine, Apricot, and Grape, these transparent screens, thus prepared, are invaluable, and their triumphant success certain. Add to this, for Cucumber and Melon frames, their superiority over glass is undoubted for preventing flagging of the foliage (sometimes being scorched) by day, and the chilling effects of radiation by night. Screens prepared with Whitney's Transparent Varnish should be also used as shades in the intensity of a summer's sun, and for protection against radiation in winter, for the stove, greenhouse and conservatory. Even in the *economy of fuel* the value of such screens is demonstrable, as less will be required to maintain an equable warmth, its escape by radiation being thus effectually checked.—J. M., 16*th April*, 1844.

Prepared by GEORGE WHITNEY, Chemist, Shrewsbury; and sold in Bottles, 2*s.* 6*d.* and 4*s.* 6*d.*, with ample directions for use; and, as a protection to the public, the signature of the inventor is on each bottle. Sold by the principal Seedsmen in London and throughout the kingdom. Merchants, Seedsmen, and Florists supplied by Mr. Bailey, North-street, Wolverhampton.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost."—*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester: Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

HORTICULTURAL SOCIETY OF LONDON.—LIST OF PRIZES

OFFERED AT THE EXHIBITIONS IN THE GARDENS, IN 1844.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; viz.:

	value—	£	*s.*	*d.*
C. The Certificate		0	10	0
SB. Silver Banksian Medal		1	0	0
SK. Silver Knightian Do.		1	5	0
LS. Large Silver Do.		1	15	0
SG. Large Silver Gilt Do.		4	0	0
GB. Gold Banksian Do.		7	0	0
GK. Gold Knightian Do.		10	0	0
LG. Large Gold Do.		20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in *CC*, *DD*, and *EE*.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in *B* cannot also exhibit in *C*.

C. Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

D. Rhododendrons, in pots; not fewer than 6 plants, in 6 varieties. LS—SK—SB.

E. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—B—C.

N.B. No one who exhibits in this letter can also compete for the following.

H. Other Roses, exhibited as in the letter *F*, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in *I* will be allowed to exhibit also in *K*.

L. Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

M. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

N. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

O. Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

P. Stove or Greenhouse Plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceæ, Cacti, and Pelargoniums, to be excluded from *P*, *Q*, and *R*.

Q. Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in *P* not to compete in *Q* also.

R. Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in *P* or *Q* will not be allowed to compete in *R* also.

S. Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

T. Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

U. Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

V. Exotic Orchidaceæ, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot show in more than one of the classes, *V*, *W*, and *X*.

W. Exotic Orchidaceæ, in collections of not fewer than 6 species. —GK—GB—SG.

X. Exotic Orchidaceæ in single specimens. SG—LS—SK.

Y. Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

Z. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

AA. Fuchsias in collections of 12 distinct varieties. LS—SK.

BB. Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

CC. Single specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. *Nothing will be regarded as new which has been exhibited in the Gardens in a previous season.*

DD. Miscellaneous subjects. SK—SB—C.

N.B. Cockscombs, Heartsease, Hydrangeas, and cut flowers, are altogether excluded from exhibition. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

EE. Seedling Florists' flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby *entitled* to a pass ticket.

IN ADDITION to any medals assigned to the classes *I*, *P*, *Q*, and *W*, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT, for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All Fruit must be FULLY ripe and WELL-COLOURED; if the contrary it will be disqualified.

FF. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine-apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in dishes of six specimens. SK—SB.

KK. Other kinds of Fruit. SK—SB—C.

JUDGES.—The Judges have the power of *increasing* or *diminishing* the number and value of the silver medals offered by the Society for particular objects, and also of *conferring* Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2*s.* cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY;
Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2*s.*

THE HAND-BOOK OF AGRICULTURE;
Chiefly for the use of those interested in the Allotment System. Price 1*s.* 3*d.*

THE HAND-BOOK OF COOKERY;
Intended for the use of the Middle Classes. Price 2*s.* cloth.

THE HAND-BOOK OF THE TOILETTE;
Having in view the union of Bodily Health with Beauty of Person. Price 2*s.* cloth.

THE HAND-BOOK OF THE LAUNDRY,
Expressly intended for those who "wash at home." Price 1*s.* 9*d.*

THE HAND-BOOK OF MEDICINE;
Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2*s.* cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.
Price 1*s.* 9*d.*

In one small volume, price 15*s.*,

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

One Volume, price 7*s.* 6*d.*

THE LIFE AND TIMES OF RIENZI.

Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man, who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: WHITTAKER and Co

In 8vo, boards, with very numerous woodcuts, price 10*s.* 6*d.*,

LINDLEY'S ELEMENTS OF BOTANY,

STRUCTURAL, PHYSIOLOGICAL, SYSTEMATICAL, AND MEDICAL.

Being a Fourth Edition of the "Outline of the First Principles of Botany."

Contents of the Work—I. STRUCTURAL and PHYSIOLOGICAL BOTANY:—1, Elementary Organs; 2, Compound Organs; 3, Root; 4, Stem; 5, Leaf-buds; 6, Leaves; 7, Food and Secretions; 8, Flower-buds: 9, Inflorescence; 10, Floral Envelopes; 11, Male Organs; 12, Disk; 13, Female Organs; 14, Ovule; 15, Impregnation; 16, Fruit; 17, Seed; 18, Acrogens, or Flowerless Plants.

II. SYSTEMATICAL BOTANY:—1, Linnean Sexual System; 2, Analytical Method; 3, Natural System; 4, Natural System of De Candolle (*this Part illustrated with Numerous Figures of the details of the more important Natural Orders*); 5, the Alliances of Plants; 6, Sketch of a New Distribution of the Vegetable Kingdom.

III. MEDICAL BOTANY; consisting of a Classified List of the Principal Medical Plants that are known in a living state in Europe; with an Explanation of the Purposes to which they are applied Medicinally.

TAYLOR and WALTON, and all Booksellers.

IRRIGATION.

FIVE ORIGINAL COLOURED PLANS OF IRRIGATED MEADOWS, ILLUSTRATIVE OF MR. J. HARDING'S SYSTEM OF IRRIGATION, with Descriptions to each, appear in *The Farmer's Magazine* for June; which contains upwards of thirty articles on Practical Farming and Grazing by the most experienced agriculturists of the day. A Higly finished Steel Engraving of PIGS EXHIBITED BY HIS ROYAL HIGHNESS PRINCE ALBERT, at the Smithfield Cattle Show; with Horticultural Calendar and a Review of the Corn Trade, &c. &c.

The Agricultural Tour of Mr. Colman, (from the United States) is continued, and embraces the following subjects:—English Capital, Appearance of the Country, Hedges and Enclosures, Iron and Sunken Fences, English Parks, Ornamental Shrubs and Flowers, Climate of England, Agricultural Population.—OFFICE, 24, NORFOLK STREET.

CURTIS'S BUDDING KNIFE.—"This is the neatest Budding-knife we have seen. The ivory handle is shaped like the blade of a curved penknife, sharp, and turned up at the point, and is evidently extremely well contrived for the purpose it is intended."—Opinion of Professor LINDLEY, in the *Gardeners' Chronicle*, July 29, 1843.

GEORGE PLUM, Surgical Instrument Maker and Cutler, No. 262, Strand, London, and at No. 3, Dolphin-street, Bristol, begs to call the attention of the public to the above new and desirable article, manufactured solely by him. Sent free to any part of the kingdom, on receipt of 38 penny postage stamps, or a post-office order for 3*s.* 2*d.*

PRINTED FOR

TAYLOR AND WALTON,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE

UPPER GOWER-STREET.

DARLEY'S SCIENTIFIC LIBRARY,

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now in the Press,*

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

A SYSTEM OF POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

SURPRISING EFFICACY of "PARR'S LIFE PILLS."

Testimonial just received by the Hibernia from America.—Dr. C. STEANE, 184, Fulton-street, sole agent for Brooklyn, L.I.—An instance of the singular efficacy of PARR'S LIFE PILLS, which merits particular notice, occurred in the person of a lady, residing at Brooklyn, of consumptive make, who had been afflicted for upwards of six years with very great and general debility, headache, flatulence, faintings, and all the effects originating in an impaired constitution. Country air was tried, but to little advantage. She complained of weariness and pain on the least motion; her bowels were sometimes constipated, and at other times lax, and never regular. At this period, she was recommended to try PARR'S LIFE'S PILLS, when, no less astonishing than true, before she had finished two boxes, an entire and perfect cure was the result. To such, nothing can equal this antidote, as it imparts tone and strength to the stomach, and operates so mildly, that the most delicate of either sex can take them with the greatest safety.—Yours truly,

To T. Roberts & Co., April, 1844. C. STEANE.

These and hundreds of other cases of decided cures, attested on the highest authority, and already published, occupy upwards of 150 pages of letterpress. These Testimonials are published periodically, and may be had on application at any respectable medicine vendor's. The cures in many instances were effected after all other means had failed, and they thus establish the claims of PARR'S LIFE PILLS in being considered the best medicine in the world.

CAUTION TO THE PUBLIC.—Beware of spurious imitations of the above Medicine. None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, engraved in the Government Stamp, pasted round each box; also the fac-simile of the signature of the proprietors, "T. ROBERTS & Co., Crane-court, Fleet-street, London," on the directions.

GLASS CHANDELIERS FOR DRAWING-ROOMS.—APSLEY PELLATT (late Pellatt and Green), Falcon Glass Works, Holland-street, Blackfriars, has recently constructed a NEW CHANDELIER (Registered), which surpasses in brilliant and refractive effects all former efforts, to which he invites inspection. Renaissance and other Glass Chandeliers as usual at low prices, which, when lighted, have a far more resplendent effect than buhl. TABLE CUT AND ENGRAVED GLASS at the Printed List of Prices, subject to an extra discount for Cash. The manufactory and steam-cutting works may be seen any Tuesday, Wednesday, or Thursday. Merchants' orders and outfits for Glass and China on the very lowest terms. No connexion with any house in the City.

Handsomely bound in cloth, with Ninety-three Wood Engravings, Price 6*s* 6*d*.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

BOGUE, Fleet-street.

Price 7*s.*, Illustrated with Wood-cuts of Birds, Cages, &c.

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact rivals the beauty of the Annuals."—*Weekly Dispatch.*

"A very delightful book of its kind. . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

London: W. S. ORR and Co.; and W. R. CHAMBERS, Edinburgh.

Just Published, in One small vol., 12mo,

RURAL CHEMISTRY.

By EDWARD SOLLY, ESQ., F.R.S.

Experimental Chemist to the Horticultural Society of London.

London: 5, Charles street, Covent-Garden.

Just published, in One Volume 8vo., price 3*s.* 6*d.*, to Fellows of the Society, and 5*s.* to others, (or post free, upon reception of a Post-office order, price 5*s.* to Fellows of the Society, or 6*s.* 6*d.* to others,)

A CATALOGUE OF THE FRUITS CULTIVATED in the GARDEN of the HORTICULTURAL SOCIETY OF LONDON. (Third Edition.) Containing the Names, Synonyms, Colour, Size, Form, Quality, Use, Time of Ripening, and many other particulars concerning all the most important varieties of Hardy Fruit cultivated in this country.

Sold at the House of the Society, 21, Regent-street, and also by LONGMAN and Co., Paternoster row; J. HATCHARD, Piccadilly; RIDGWAY, Piccadilly; RIVINGTONS, Waterloo-place; and by the principal Booksellers in all parts of the Empire.

A few Copies of the Second Edition of this Catalogue may be had at the reduced price of 1*s.* 6*d.* each.

EVERY SATURDAY IS PUBLISHED, PRICE SIXPENCE, STAMPED TO GO FREE BY POST,

The Railway Chronicle.

JOURNAL OF ENGINEERING IMPROVEMENTS, MECHANICAL INVENTIONS, PUBLIC WORKS, &c.

THERE HAS BEEN CREATED within the last ten years a PRODUCTIVE PROPERTY IN RAILWAYS amounting to more than SIXTY MILLIONS sterling, with a REVENUE of nearly SIX MILLIONS PER ANNUM. This addition to the wealth and resources of England has been produced by the Investment of the funds of nearly Fifty Thousand Individuals, who form the Railway Constituency of Great Britain. It affords employment to a great body of our Workmen, tends to the development of our industrial Capabilities, and is a boon to the whole travelling Population.

It is strongly felt that Railway property, involving interests so extensive, should not be exposed to the injurious effects which the want of sound information and the circulation of erroneous statements for party purposes so constantly produce; and it has appeared, to those most capable of judging, that the mutual interests of the Proprietary, the Managers, and the Railway Executive, and the Public interests with which they are identified, have as yet found *no* organ in which they can be fairly discussed and satisfactorily adjusted. The RAILWAY CHRONICLE has been projected to supply this deficiency, by THE ESTABLISHMENT OF AN AUTHENTIC AND IMPARTIAL MEDIUM OF COMMUNICATION BETWEEN ALL THE MEMBERS OF THE GREAT RAILWAY COMMUNITY; having especially in view the free communication of useful information, the promotion of the common interests and the general circulation of sound intelligence in all that relates to Railway property.

The Conductors of the RAILWAY CHRONICLE will use their anxious endeavours to advance the great interests of Railway property, avoiding all indulgence of personal feeling, the expression of party prejudice, or the advancement of exclusive interests;—they desire, in short, to furnish an unbiassed Chronicle of facts, and a fair arena for the discussion of important opinions and principles.

The RAILWAY CHRONICLE *contains the earliest and most authentic information on the following subjects:—*

THE CONDITION AND PROSPECTS OF RAILWAYS NOW IN USE.
POSITION, PROGRESS, AND VALUE OF FOREIGN RAILWAYS.
PROGRESS OF RAILWAYS IN EXECUTION.
PROJECTED NEW RAILWAYS.
THE TRAFFIC AND REVENUE OF RAILWAYS.
THE ECONOMY OF WORKING AND EXPENDITURE.
THE VALUE OF SHARES.
PAYMENT OF CALLS, DIVIDENDS, AND DEBENTURES.
THE PROCEEDINGS AT RAILWAY MEETINGS, WITH THE DOCUMENTS LAID BEFORE SUCH MEETINGS.
WEEKLY REPORTS ON THE MONEY AND SHARE MARKETS.
THE PROCEEDINGS OF THE BOARD OF TRADE AND OTHER PUBLIC OR MUNICIPAL BODIES, SO FAR AS THEY AFFECT THE INTERESTS OF RAILWAY PROPERTY.
PARLIAMENTARY RAILWAY PROCEEDINGS.
RAILWAY LEGAL INFORMATION.
CONTRACTS FOR EXECUTION OF WORK.
STATE OF THE IRON TRADE.
ENGINEERING WORKS OF MERIT ON RAILWAYS AT HOME AND ABROAD.
ENGINEERING IMPROVEMENTS ON RAILWAYS AT HOME AND ABROAD.
MECHANICAL INVENTIONS RELATING TO RAILWAYS AT HOME AND ABROAD, ILLUSTRATED BY WOOD-CUTS.
LOCOMOTIVE IMPROVEMENTS AND INVENTIONS AT HOME AND ABROAD.
REPORTS OF THE SCIENTIFIC SOCIETIES, WHENEVER ANY SUBJECTS AFFECTING RAILWAYS ARE DISCUSSED.
RAILWAY LITERATURE.
RAILWAY PATENTS.

Arrangements have been made for the purpose of supplying in the RAILWAY CHRONICLE the earliest information concerning the FRENCH RAILWAYS (*the figures being in English money*), in which so much British capital is now invested, and the other Railways on the Continent which are in progress or in prospect.

Weekly Reports from the London, Liverpool, Manchester, and Northern Share Markets will afford the Capitalist the means of judging of the condition of Railway investments.

Another peculiar feature of the RAILWAY CHRONICLE is to consist in a series of papers on each of the Great British Railways—in which the Past History, Present Condition, and Future Prospects of every Railway will be concisely developed. It is hardly to be presumed, that the great number of persons who have of late years begun to interest themselves in Railway Property, can have had the leisure and opportunity necessary to understand the peculiar circumstances and character of each individual Railway, so as to estimate properly the relative value and prospective profit of these investments. This information will be given in the successive Numbers of the RAILWAY CHRONICLE. For those who are now for the first time becoming subscribers to a Railway Paper, this feature is important, as it will enable them rapidly to obtain an acquaintance with the whole of the existing lines.

To CAPITALISTS, BANKERS, SOLICITORS, STOCK-BROKERS, INSURANCE COMPANIES, and all who hold Money for investment, the RAILWAY CHRONICLE will furnish such sound unprejudiced information as shall enable them at once to make a judicious choice for the investment of funds at their disposal.

To ENGINEERS, the RAILWAY CHRONICLE will afford information on all points of Practical Engineering that may tend to the advancement of the profession, and to the perfection of that Railway communication which their talents have placed in its present admirable condition, and which it remains for their skill to render more available to the Public, and therefore more beneficial to the Shareholder. Through this channel of intercommunication every intelligent person will have an opportunity of contributing to the common stock of knowledge, and consequently to the general welfare.

To CONTRACTORS, MANUFACTURERS, INVENTORS, and PRACTICAL ENGINEERS and MECHANICS, the RAILWAY CHRONICLE will afford the means of bringing before the Influential Part of the Railway Proprietary, such Inventions, Discoveries, Practical Works, Mechanical Improvements and Articles of Manufacture, as they may desire to introduce into Railway employment; and it will afford the means of ascertaining where their practical assistance can be required either on lines projected or in execution. Thus the columns of the RAILWAY CHRONICLE will open a market for the labour of the Contractor, the inventions of the Mechanist, and the commodities of the Manufacturing Engineer.

The Railway Chronicle

Is published EVERY SATURDAY, in time for the Morning Mails.

ELKINGTON'S SYSTEM OF DRAINING.

Lately published, a Third Edition of

A SYSTEMATIC TREATISE ON THE THEORY AND PRACTICE OF DRAINING LAND, adapted to the various situations and soils of England and Scotland, as drawn up by appointment of the Board of Agriculture, from the communications of Joseph Elkington. To which is added, a Treatise on Embankments and the Formation of Artificial Pieces of Water, &c. &c. By JOHN JOHNSTONE, Land Surveyor. In One Volume, illustrated by numerous Plans and Sections. Price 10s. 6*d.*

"The great success which attended Elkington's practice attracted the attention of the Government of the day, and a Parliamentary grant of 1000*l.* was voted to him on consideration that he should impart his secret, as it was then considered, to certain individuals appointed by the Board of Agriculture. This was done; and the result, published by Johnstone, one of the persons appointed, displays one of the most beautiful and important applications of scientific principles to practical purposes within the whole range of human knowledge."—*Report of Proc. of Royal Institution, May 24, 1844.*

WM. BLACKWOOD & SONS, Edinburgh and London.

This Day is Published, Price One Shilling,

A LECTURE ON INSTITUTIONS FOR THE BETTER EDUCATION OF THE FARMING CLASSES, especially with reference to the proposed Agricultural College near Cirencester, with some remarks on Experimental Farms, and on the class of inquiries for which they are more particularly designed, delivered at the Botanic Garden, Oxford, on Tuesday, May 14, 1844. By CHARLES DAUBENY, M.D., F.R.S., &c. Honorary Member of the Royal Agricultural Society of England, and Professor of Rural Economy at the University of Oxford.

Oxford: Printed by THOMAS COMBE, Printer to the University. Sold by JOHN HENRY PARKER; and JOHN MURRAY, Albemarle-street, London. 1844.

KNIGHT'S WEEKLY VOLUME FOR ALL READERS—A SHILLING.

The Publication will commence on SATURDAY, JUNE 29, 1844. The Works to be issued from the commencement, to SATURDAY, SEPT. 28, will be as follows:—

8. CAPITAL AND LABOUR: a new Edition, including "The Results of Machinery." By Charles Knight. 1 Vol.
9. DIALOGUES ON INSTINCT. By Henry Lord Brougham. F.R.S. A new Edition (reprinted from "Dissertations on Subjects of Science and Natural Theology"). 1 Vol.
10. BIRD ARCHITECTURE. By James Rennie, A.M. A new Edition. . . . . 1 Vol.

*** The preceding 10 Works, forming 14 Volumes, will furnish some notion, although not a complete one, of the range of subjects that will be embraced in KNIGHT'S WEEKLY VOLUME. No. 1 belongs to the class of HISTORY and BIOGRAPHY; Nos. 2, 4, and 7, to GENERAL LITERATURE, including Poetry and Fiction; Nos. 3 and 6 to GEOGRAPHY, including Voyages and Travels; No. 5 to ARTS and MANUFACTURES; No. 8 to PUBLIC ECONOMY; No. 9 to SCIENCE; No. 10 to NATURAL HISTORY.

London: CHARLES KNIGHT and Co., 22, Ludgate-street. Sold by all Booksellers.

On the 1st of July, in demy 8vo, price 6s.,

THE NEW QUARTERLY REVIEW, and HOME, FOREIGN, and COLONIAL JOURNAL, being the Seventh Number of the FOREIGN AND COLONIAL QUARTERLY REVIEW.

In announcing the Seventh Number of the "FOREIGN AND COLONIAL QUARTERLY REVIEW," the Proprietors have to apprise their readers of the reasons that have induced them to adopt a partial change in the Title. Their original scheme, as the Prospectus stated, contemplated the intermingling of British and Foreign subjects. But from the similarity of the Title with existing Foreign Reviews, considerable practical inconvenience has been experienced by their Subscribers. They have, therefore decided upon a more General Title, "THE NEW QUARTERLY REVIEW," by which, while maintaining their own distinctiveness, they disclaim any intention of rivalry with existing Reviews beyond that of upholding the noblest principles, and producing the best arguments in their support. Were they called upon to add further reasons for this measure, they might state, that in all directions they have been urged to assume in name, as well as fact, their true position. Their career in Foreign Literature is already before the Public; and they purpose not only the continuation, but even the augmentation of the Foreign Correspondence and Intelligence; and in British subjects, they are justified in stating, that the aid they have hitherto received from some of our leading Statesmen will still be continued.

London: SMITH, ELDER, and Co., 65, Cornhill; Edinburgh: BELL and BRADFUTE; Dublin: J. CUMMING.

8vo, sewed, price 2s. 6*d.*; by post 3s.,

A DESCRIPTION of the BAR-AND-FRAME HIVE, invented by W. AUGUSTUS MUNN, Esq., with an Abstract of WILDMAN'S Complete Guide for the Management of Bees throughout the Year.

Detailed Prospectuses may be obtained at the office, or will be forwarded, post free, upon application.

The usual commission to Solicitors.

Agents are appointed in all the Principal Towns in the Kingdom.

W. SHAW, Managing Director.

News of the Week.

THE excitement which prevailed in political circles throughout Saturday and Sunday, in consequence of the defeat of Ministers on the Sugar Duties on Friday night, (the second defeat they had sustained within a week,) has scarcely yet subsided. On Saturday it was currently rumoured that Sir R. Peel had tendered his resignation, and that Her Majesty had not only accepted it, but had opened communications with the Duke of Richmond as the head of a new Cabinet. These rumours acquired fresh strength from the meeting of Conservative Members, convened on Monday at the Carlton, to express unlimited confidence in Sir R. Peel, and from the long sittings of two Cabinet Councils, which were held on Saturday and Monday. After the sitting on Monday, however, it was known that Ministers had determined neither to resign, nor to renew the present Sugar Duties for another year, but to call upon the House of Commons to rescind their vote of Friday night, under the threat of resignation if the Cabinet were again defeated. This decision produced the same result as the similar threat on Lord Ashley's Bill, and accordingly the Government proposition which was negatived on Friday by a majority of 20, was virtually affirmed on Monday by a majority of 22. For this result the Cabinet was indebted to the support of eleven free-trade members, who on other occasions have voted for a diminution of duties, and to that of four Conservative members who had voted against Ministers on Friday, and now supported them in opposition to their former votes. For the opinion entertained by independent members of all parties on this second instance of the House reversing its decisions at the desire of the Ministry, we must refer to our Parliamentary Report. On Thursday, the Sugar Bill was again brought forward, and after an animated discussion on some of its details, it passed through Committee without modification, and the Report was received last night, on a division, by a majority of 118. On Wednesday, Mr. Strafford O'Brien brought forward his Bill for abolishing the practice of holding Vestries in Churches. After an angry discussion, arising out of the equivocal support given by Government to the measure, the House decided in its favour by so small a majority, that the Bill would have probably been lost on a third division, if Mr. O'Brien had not rescued it by obtaining the adjournment of the House. On the same evening the mayor and aldermen of Dublin appeared at the bar of the House to present a petition from the Corporation of that city, on the subject of the recent trial and imprisonment of Mr. O'Connell and the other traversers. An address on the same subject had been previously presented by the deputation to the Queen upon the throne, and Her Majesty had declared in reply, that any errors in the late proceedings would be rectified by the Supreme Court of Appeal, and that she was resolved to respect the decisions of her Courts of Law. In connection with Ireland we may notice the statement of Sir Robert Peel on Thursday night, that Earl de Grey is contemplating a resignation of the Lord-Lieutenancy of Ireland, solely on the ground of ill health, and that an early change will probably take place.

From France we have news of some importance, confirming the statement of Lord Aberdeen last week on the improbability of war between France and Morocco. It appears by advices from Algiers that the collision between the contending troops, noticed in our last, has convinced the Emperor of the hopelessness of any struggle with the French Army, and that he has consequently recalled his forces. The French Government, however, have sent the Prince de Joinville, with a squadron, to the coast of Morocco, and it is said to be their intention to demand the expulsion of Abd-el-Kader from the Moorish territory, as the condition on which alone they will suspend hostilities. —The Bill on Secondary Instruction, which was for so many weeks under discussion in the Chamber of Peers, has been brought forward in the Deputies this week, the Ministry having determined to carry it into a law during the present session. The first step, however, the selection of the committee on the Bill, has proved a serious check both to the Government and the Church, seven out of the nine members chosen being hostile to the Bill and friends of the University. An angry discussion is consequently looked for, and the Bill will probably be modified in its most important features.

Home News.

COURT.—The Queen left Buckingham Palace on Friday morning for Claremont, where Her Majesty was joined, at a later period of the day, by Prince Albert and the King of Saxony, who visited Richmond and Hampton Court on their way. On Saturday the Prince and the King of Saxony proceeded from Claremont to Chiswick, to view the Exhibition of the Horticultural Society, after which they returned to Buckingham Palace. The Queen also left Claremont on Saturday morning, for town. On Sunday Her Majesty and the Prince attended divine service in the Chapel Royal of Buckingham Palace. On Monday Her Majesty and Prince Albert took their daily walk in the Palace gardens, and the Prince afterwards rode out on horseback. On Tuesday the Queen and Prince Albert took their usual walk, and in the evening His Royal Highness dined with the Duke of Wellington, at the Waterloo Banquet, at Apsley House. On Wednesday the Queen held a Court for the reception of an Address to the Throne from the Corporation of Dublin, the particulars of which are given in another column. Previous to the reception of the Address, Her Majesty held a Privy Council, which was attended by all the Ministers. On Thursday, Prince Albert left town for Eton College to lay the foundation of a new range of buildings. In the evening the Queen and Prince honoured the Italian Opera with their presence. Thursday being the anniversary of her Majesty's Accession, the day was observed with the usual honours. The Hon. Miss Devereux has succeeded Lady Caroline Cocks, as one of the Maids of Honour in Waiting on Her Majesty.

THE KING OF SAXONY.—On Friday his Majesty, accompanied by Prince Albert, paid a visit to Hampton Court, and inspected the palace and gardens. On Saturday, his Majesty and Prince Albert honoured the Horticultural Society by attending their meeting at Chiswick. The Royal party, on their arrival at the gardens, were received by Dr. Lindley, and conducted to the conservatory and the marquees containing the flowers and fruits. The King and Prince remained in the gardens until 1 o'clock, and then took their departure for Buckingham palace. In the afternoon his Majesty, attended by his suite, honoured the establishment of Messrs. Hunt and Roskell with a visit, and remained nearly an hour, inspecting the plate and jewellery. A deputation from the Royal Society, consisting of the Marquess of Northampton President; Dr. Roget and Mr. Christie, Secretaries; Mr. Weld, Assistant Secretary; and Messrs. Murchison, Lee, Graham, and Dollond, afterwards had the honour of waiting upon his Majesty at Buckingham Palace, when his Majesty, having been elected a Fellow of the Society, inscribed his name in the charter book. In the evening the King honoured Sir Robert and Lady Peel with his company at dinner, at their residence in Whitehall Gardens. The company invited to meet his Majesty partook rather of a literary and scientific meeting, than of a fashionable dinner, and included the Marquess of Northampton, Earl of Aberdeen, Earl and Countess of Wilton, Earl and Countess Delawarr, Bishop of Norwich, Sir George Murray, Dr. Buckland, Rev. Sydney Smith, Mr. Hallam, Professor Owen, Mr. Samuel Rogers, Mr. Brown, the botanist, and the King's suite. In the evening Sir R. Peel gave a conversazione, at which several of the nobility and foreign ministers were present, with the following gentlemen distinguished in literature and science:—Mr. Murchison, Sir I. Brunel, Mr. Brunel, Sir R. Westmacott, Sir M. A. Shee, Sir B. Brodie, Sir J. Herschell, Sir H. Ellis, Mr. Wyon, Mr. Eastlake, Mr. Yarrel, Mr. Cockerell, Professor Faraday, Mr. Forbes, Sir H. Delabeche, Dr. Paris, Professor Whewell, Mr. Hamilton, Sir W. Hooker, Dr. Mantell, Sir W. Symonds, Mr. Walker, Dr. Lindley, Dr. Bunbury, Mr. C. Fielding, Mr. E. Landseer, &c. On Sunday morning the King attended divine service at the Roman Catholic chapel in Warwick-street. On Sunday night his Majesty honoured the *Times* printing-office with a visit. His Majesty arrived in Printinghouse-square a few minutes before twelve o'clock, attended by Baron Gersdoff, his suite, and the Hon. C. A. Murray. His Majesty was conducted over the whole establishment, and manifested great interest in the operations of the compositors and the construction of the machines. His questions displayed great intelligence, and an anxious desire to become acquainted with the several processes by which the "matter" is prepared for the press, and ultimately printed off. Having remained for nearly three-quarters of an hour, his Majesty took his departure, expressing, as he was about to leave, his pleasure and satisfaction at all he had witnessed. His Majesty seemed much pleased when informed that the inventor of the *Times* printing machine, which particularly attracted his attention, was a native of his own dominions, and that one similar in principle, although less elaborate and of inferior power, had been erected by that person at Leipzic. On Monday his Majesty visited Woolwich, to inspect the Royal Arsenal, where he was received by all the officers attached to that establishment. After visiting the foundry, the laboratory department, the model rooms, the steam machinery and storehouses, his Majesty proceeded to the garrison, and visited the Mess-room. His Majesty having visited the royal repository grounds and Rotunda, and the various descriptions of arms and models of dockyards and fortifications, and other objects of interest, proceeded to Greenwich Hospital, where he was conducted over the whole of the establishment by Admiral Sir R. Stopford, governor of the hospital, and by the heads of the various departments. The King then proceeded to Chelsea Hospital, and after inspecting that institution and the Military Asylum, His Majesty returned to Buckingham Palace, and accompanied the Queen to the Italian Opera in the evening. On Tuesday morning His Majesty surprised the porters at St. Paul's by an early visit, and ascended the Cathedral at 5 A.M., to have a panoramic view of London before the fires are lighted. The morning, however, was not favourable, being too cloudy to give effect to the view. From St. Paul's His Majesty went to Smithfield, thence to Billingsgate, and afterwards to Covent-garden-market. His Majesty was on foot, and was attended by the gentlemen of his suite. His Majesty after breakfast inspected Pentonville Prison. His Majesty was received by the Duke of Richmond and Major Jebb, two of the Commissioners for the government of the Prison, by the governor, chaplain, and the officers of the prison, and after minutely inspecting the whole establishment, was pleased to express his approbation. The King next paid a visit of inspection to the General Post-office, and afterwards honoured the Lord Mayor with his company at the Mansion-house. After his arrival His Majesty proceeded to the Central Criminal Court, where a criminal trial was proceeding. His Majesty took his seat on the bench, and remained until the trial had concluded, a period exceeding an hour and a half. The King then returned to the Mansion-house, accompanied by the Lord Mayor and Sheriffs, where a *dejeúner* was served to the King and a select party. After the *dejeúner* His Majesty attended by the Lord Mayor and the civic authorities, went on foot to witness the inauguration of the statue of the Duke of Wellington. His Majesty also inspected the Royal Exchange, and then returned to the Mansion-house. After remaining some time, the King, accompanied by the Lord Mayor and Sheriffs, drove to the Temple, where his Majesty and suite were received by the Solicitor-General, who conducted the King over the Temple Church. After visiting that edifice, his Majesty visited the halls of the Middle and Inner Temples. His Majesty then took leave of the Lord Mayor and Sheriffs, and drove to the Gallery of Painters in Water Colours, in Pall-mall East, where his Majesty and suite alighted, and viewed the exhibition. The King then proceeded to the British Institution, in Pall-mall, and, after inspecting the collection of pictures, returned to Buckingham Palace. On Wednesday his Majesty visited the National Gallery and the Exhibition of the Royal Academy, where he was conducted by the keeper

through the different schools of the Exhibition. His Majesty remained two hours inspecting the numerous works of art in the galleries, and then proceeded to honour Lord Francis Egerton with a visit, at his residence in Belgrave-square. The King returned to Buckingham Palace, and lunched with the Queen and Prince Albert, after which he paid visits to the Duchess of Gloucester, the Duke and Duchess of Cambridge, the Duke of Wellington, the Duke of Devonshire, the Earl and Countess Delawarr, the Earl of Wilton, the Countess of Mansfield, the Earl of Aberdeen, and Sir Robert and Lady Peel, to take leave previous to his departure from town. H.R.H. the Duke of Cambridge visited the King on his Majesty's return to Buckingham Palace. On Thursday morning his Majesty took leave of the Queen and Prince Albert, and left town for Hatfield House, Herts, to honour the Marquess of Salisbury with a visit; after which it is his Majesty's intention to make a tour in Wales and Scotland.

THE CROWN PRINCE OF DENMARK.—His Royal Highness arrived at Inverness on Wednesday week, by the Glasgow steamer, unexpected even to his own officers and suite, who did not look for his appearance till the next week. No preparations were therefore made for his reception; but as soon as it was known that his Royal Highness was in the town, Provost Sutherland waited upon Count Reventlow, and the Captain of the Danish frigate, now at Cromarty, and ascertained that, although the Prince had arranged to embark on Thursday for the Faroe Isles, he was still most anxious, if possible, to visit the field of the Battle of Culloden. It was therefore arranged that the magistrates should accompany his Royal Highness and suite to Culloden Moor on Thursday forenoon, which they did with a respectable cavalcade, which was joined on the ground by Mr. Forbes, of Culloden, and Mr. M'Intosh, of Raigmore, the proprietors of the soil. Culloden's piper was also in attendance, and pointed out the positions of the contending armies on the 16th April, 1746; while on the moor, Mr. Forbes, of Culloden, presented his Royal Highness with some relics of the field, consisting of a cannon ball, and a finely-ornamented barrel of a pistol, with which the Prince expressed himself highly gratified. After minutely inspecting the graves of those who fell, and the disposition of the battle, his Royal Highness inspected the sepulchral and religious monuments of Clava (whether Danish or Druidical is uncertain), under the guidance of Mr. Anderson, secretary of the Northern Institution for the promotion of Science and Literature. In these remains his Royal Highness expressed himself peculiarly interested, especially from their resemblance to similar antiquities in his own country; and he was also much delighted with the magnificent panorama of the Highland mountains of Inverness and Ross-shire, presented from the elevated ridge above Culloden. The Prince then embarked for the Faroe Islands, and Count Reventlow, the Danish Minister, returned to town. During his Royal Highness's stay in Glasgow, it was resolved by four of the Baptist churches in the city, to present a respectful memorial to the Prince, soliciting his influence on behalf of their brethren in Denmark, who are at present suffering persecution, and some of them imprisoment, for their religious opinions. The petition was written in French and English, and transmitted to the Prince by the Lord Provost.

The Deputation from Dublin.—On Wednesday, the Right Hon. H. O'Brien, Lord Mayor of Dublin, accompanied by his chaplain, the Very Rev. Dr. O'Connell, Aldermen Egan, Keshan, Butler, and Gardiner; Town Councillors J. Dunn, Michael Staunton, John Reilley, John M'Gloin, C. P. Gaven, R. White, M. Tobin, J. L. Arabin, W. Fitzpatrick, Esqrs.; with the lord mayor's secretary, high constable, mace-bearer, city marshal, and sword-bearer, composing a deputation of the Corporation of Dublin, presented an address to the Queen, at Buckingham Palace, on the subject of Mr. O'Connell's imprisonment. The substance of this address was very nearly the same as the petition presented on the same day to the House of Commons, the heads of which are given in our Parliamentary Report. The Queen was attended by the Duke of Wellington, Sir R. Peel, Lord Stanley, Sir J. Graham, all the principal Officers of State, and of the Household. The deputation having been conducted to the foot of the throne, the Lord Mayor read the address; his Lordship then advanced, and kneeling before the Queen, presented it to her Majesty. The Queen returned the following answer to the address:—"I thank you for your renewed assurances of loyalty to my person and crown. I have announced to you my fixed determination to uphold the law, and to respect the decisions of my courts, to which the administration of justice is confided. If errors have occurred in the proceedings of the courts, they are open to review, and will be rectified by the supreme tribunal of appeal. The faithful execution of the law is regarded by me as the surest safeguard of the rights and liberties of my people." The seconder of the address had then the honour of being presented to her Majesty, and the senior alderman had also the honour to kiss hands. The Lord Mayor and the deputation then retired from the presence of the Sovereign, and proceeded to the House of Commons, where they presented their petition to that branch of the Legislature.

Official Appointments.—The Queen has been pleased to appoint George Tradescant Lay, Esq., to be Her Majesty's Consul at Amoy, in China; Rutherford Alcock, Esq., to be Her Majesty's Consul at Foo-chow-foo, in China; Charles Edward Keith Kortwright, Esq., to be Her Majesty's Consul at Carthagena, in the Republic of New Granada; and John William Perry Farren, Esq., to be Her Majesty's Consul to the Philippine Islands.

Mr. Serjeant Goulburn has been appointed a Commissioner of the Court of Bankruptcy, in the room of the late J. H. Merivale, Esq.

Ecclesiastical Commission.—Several orders in Council have been published, which were passed on the 23d ult., on the representation of the Ecclesiastical Commissioners, constituting separate districts for spiritual purposes, in the following places:—Stockport, Ashton-under-Lyne, Bolton-le-Moor, and Bury, Lancashire; Burslem, Shelton, and Wednesbury, Staffordshire; Whitford, Flintshire; St. Mary, Pembroke; in Bethnal Green (six); All Saints, Newcastle; Camborne and Illogan, Cornwall; Charles the Martyr, Plymouth, Devon; Halstead, Essex; St. John, Horselydown, Surrey; Birstal, Keighley, and St. George, Barnsley, Silkstone, Yorkshire; and St. Philip and Jacob, Bristol.

Foreign.

FRANCE.—Our accounts from Paris announce the arrival at Marseilles last week of the Charlemagne packet from Algiers, which port she left on the 10th, bringing a confirmation of the affair with the troops of Morocco, with the addition that the Emperor, on hearing the check his troops had met with, disavowed the conduct of their commander, and that at Algiers this affair was considered settled. Marshal Bugeaud had arrived at Oran, on his way to the camp of General Lamoriciere. The Prince de Joinville left Paris on Monday, to take the command of his squadron, having been unexpectedly delayed in accordance with orders from the Government. This delay had given rise to many conjectures, among which it was rumoured that a quarrel had taken place between the Prince and the Ministry, in consequence of H.R.H. refusing to take the command if tied up by instructions, and that the Ministry at length had yielded to his wishes and given him unconditional authority. The *Journal des Débats* contains an article upon the quarrel between France and Morocco, which is attributed to the pen of M. Guizot. This article states that "France has no idea of territorial aggrandisement, no thought of conquest," and that, if forced to take possession of Morocco, "she would have no wish to retain it." It also states that "the space in Africa which she occupies, and will always occupy, is sufficient for her, and that she does not wish to add an inch to her possessions."—An address to Mr. O'Connell from the Catholics of France, written by M. de Montalembert, has been got up in Paris, expressing sympathy with him in his imprisonment. The Ministerial *Débats* disapproves of this proceeding, and publishes extracts from Mr. O'Connell's speeches in November and January last, in which he said that Louis-Philippe had broken his promise to the French nation to give them the three points of the the charter—liberty of education, liberty of the press, and trial by jury; and declared that if Henry V. would only promise to give a charter, there would be an Irish brigade ready to assist him in 24 hours. The *Débats* says:—"All comment is unnecessary, until such time as Mr. O'Connell comes with his Irish brigade to re-establish the Duke of Bordeaux on the throne, and to drive away the *monsters* who now compose the University of France. It is but right that the brigade of French Catholics should go, with M. de Montalembert at their head, to felicitate Mr. O'Connell in his prison."—On Monday an animated discussion took place in the bureaux of the Chamber of Deputies on the subject of the Secondary Instruction Bill, the Ministry having determined, contrary to general expectation, to carry it into a law during the present session. The bureaux accordingly met to elect the members of the committee on the Bill, and the result has been a serious check both to the Government and the Church. Of nine members chosen upon the committee, two only are in favour of the Ministerial Bill. The other seven are all opposed to the Bill, as passed by the Chamber of Peers, and in favour of the University privileges. All the members of the committee are members of the Opposition, with the exception of two, and even these belong rather to the party of M. Molé. It is expected that M. Thiers will be the member entrusted with the drawing up of the report of the committee, which, in that case, may be expected to be very hostile to the Ministry.—The Chamber has commenced the debate on the Railway Bills. It is thought probable that all the Bills will ultimately be adopted as proposed by Government, but not without opposition. If this expectation be correct, all the railways will be given to companies, with the exception of that from Paris to the Belgian frontier, which is to be executed by the state. It is not expected that the Chamber will pass more than three of the Bills during the present session.—A stirring topic with the journals is a quarrel between Baron Seguier, President of the Cour Royale of Paris, and the members of the bar. The baron having made some remarks in court which the *avocats* deemed offensive to their profession, the latter assembled under the presidency of their batonnier and council, and unanimously addressed the president in a letter, demanding a public retractation of his remarks. Several conferences have taken place between the Procureur-General, the Judges of the Cour Royale, and the Batonnier of the Order of Advocates, with the hope of bringing about a reconciliation, but at present without effect.—The King, Queen, and Royal Family, dressed in deep mourning for the Duc d'Angoulême, arrived at the Tuileries from Neuilly on Monday. His Majesty, after transacting business with some of his ministers, proceeded to the Champs Elysees, and visited for the sixth time the products of the national industry.—The arrival of the Danae, French frigate, at Brest, puts an end to an idle story which is reported in a Barbadoes paper, received last week, that the Dublin, of 50 guns, Captain Tucker, had been sunk, with her colours flying, by three French frigates, for having given protection to Queen Pomaré, who had taken refuge on board her. The Danae was one of the frigates at Tahiti, and she mentions nothing of such an event. The French garrison at the Marquesas was in distress for clothes and money, having had no pay for fifteen months, and nothing but salt provisions.

SPAIN.—Our accounts from Madrid are of the 10th inst. M. Viluma having entered on the functions of Minister for Foreign Affairs since the 6th, a Royal decree bearing that date relieved M. Mon from the temporary direction of that department. The conferences between the Government creditors and the Committee of Finance still continued, but had as yet been productive of no definitive result. The former consented to receive the Three per Cent. Stock offered to them in payment of their claims; but the Minister wished to issue it at 40, whilst they refused to accept it above 30. A letter from Ceuta of the 1st inst. states that the Pachas and military chiefs of Morocco were actively engaged in making warlike preparations, but that the population of Tetuan, Angora, and Tangiers were greatly opposed to war. Ceuta had assumed an imposing attitude since the arrival of the new Commander General, and the Spanish squadron, consisting of a frigate, a corvette, two brigs, a steamer and two packets were before Tangiers. Letters from Barcelona state that with the exception of the scorbutic affection under which Queen Isabella suffers, her general health is good. The dropsical tendency which alarmed her Majesty's physicians has disappeared at Barcelona; but her hands, forehead, and chin, have become covered with decided tetters. The body is also covered with eruptions which are attributed to the heat and change of climate. Her Majesty sleeps well and is stout. The two Queens were still at Barcelona on the 8th, but an early day was expected to be fixed for their departure to Caldas, where certain alterations and preparations have been made in the bathing materials of that place.

GERMANY.—Accounts from Berlin state that serious disturbances have taken place among the workmen in the mines and manufactories of Silesia. The *Prussian Gazette* states that they are completely put down; but later accounts assert that similar disturbances, and more serious in character, had broken out at Breslau. The disorders are in no way connected with politics, being a mere quarrel between the workmen and their masters on the subject of wages. The disorders broke out in Altfriedland in the circle of Waldenburg on the 7th inst. Troops of labourers attacked the house of one of the partners in a manufactory that had been destroyed at Peterwalden. They pillaged and destroyed everything; they carried off money, goods, and machinery. However, the authorities succeeded in restoring order without having recourse to the Military force. At Leutmandorff in Schweidnitz, there was also a turn-out, but the mob was dispersed by the civil authorities.—The Emperor of Russia arrived at Munster on the 12th, and after changing horses, continued his journey for Brunswick.

ITALY.—A Paris paper contains the remarkable announcement that the treasure of the sanctuary of Loreto has been stolen, and that the event has thrown the Court of Rome into consternation. At the time the French conquered Italy, the Pontifical Government removed to Rome the Madonna's rich coffer, in order to shelter it from the covetousness of the conquerors. Since the restoration it has been conveyed back to Loreto, and new offerings had increased its richness. Count Rocchi, Receiver-General of the province of Ancona, to whose custody the coffer of Loreto was entrusted, has embarked in an Austrian steamer proceeding to Trieste, and carried off the contents of all the coffers, the keys of which he had in his possession.

TURKEY & SYRIA.—We have advices from Constantinople of the 27th ult., announcing that a firman had been obtained by the British Ambassador to permit the building of the Protestant church at Jerusalem. Sir Baldwin Walker left Constantinople on the 24th ult. for England, without having effected any arrangement of the question pending between him and the Porte. The Sultan quitted the capital on the morning of the 26th, accompanied by the heir apparent, Abdul Azis, brother of his Highness. He was about to proceed to Broussa and the Dardanelles. The Montenegrins have again committed great excesses against their Turkish neighbours, attacking a caravan of Turkish merchants from the Herzowina, returning from Rajura; they murdered part of the merchants, and carried off all their goods. They sent the heads of the murdered persons as trophies to the Vladika, who, however, immediately sent back the heads, and ordered the goods to be restored. The plunder was dispersed in all directions, but search was making for it, and the Vladika had sent to the Turkish Pacha assurances that satisfaction should be given.

BRAZILS.—By the Swift packet from Rio, we learn that the marriage of the Princess Januaria with the Neapolitan Prince, the Conde d'Aquila, took place on the 28th of April. It was believed that a portion of the revenues of the empire was mortgaged to the Prince as security for the payment of her dower. The Princess cannot leave the country until Don Pedro has a child, that is to say, as long as she is heir-apparent. A report was prevalent, and credited for some time, that the Empress was pregnant, but it was afterwards contradicted.

Parliament.

HOUSE OF LORDS.

Friday.—After the discussion on the distressed state of the Scotch Schoolmasters, which we noticed in our last, the Bishop of

EXETER moved the second reading of his Suppression of Brothels Bill.—Earl FITZHARDINGE seconded the motion, and excited much laughter by an attack on the Dean and Chapter of Westminster, for refusing to admit Thorwaldsen's statue of Lord Byron into Westminster Abbey, while they derived a profit from the character and occupations of the residents in a certain part of the property of the Dean and Chapter of Westminster, situated at no remote distance from the Abbey.—The Bishop of GLOUCESTER defended the Dean and Chapter, and said that they had bought the lease of the property and had destroyed it some time ago; and Lord BROUGHAM blamed them for continuing to exclude the statue of Byron.—The Bishop of LONDON justified the Dean and Chapter for excluding the statue, and hoped they would never admit any memorial of Lord Byron into the House of God.—Some conversation followed, during which the Bishop of EXETER suggested a national gallery for monuments to public men, instead of placing them in churches. The Bill was ultimately read a second time.

Monday.—The Earl of RADNOR moved for a return of the number of warrants issued by the present Secretary of State, for the detention and opening of letters by the general Post-office, specifying the dates and names of the parties, and giving the forms of the warrants. The noble Earl brought forward the case of Signor Mazzini, which was discussed by Mr. Duncombe, in the House of Commons, on Friday last, and the case of Count Ostrowski, a Pole, who had recently been arrested, and his papers searched, as the grounds of this motion.—The Duke of WELLINGTON refused the return, because he thought sufficient confidence should be reposed in the Secretaries of State for the due exercise of the power the law gave them of issuing their warrants for the opening of letters; and because, in the case of the Pole, his arrest had been in the usual course, and was a matter for the decision of a police-court, and not their lordships' House.—After an exposition of the law and policy of these warrants by Lords CAMPBELL, BROUGHAM, and DENMAN, and remarks by the Marquesses of NORMANBY and CLANRICARDE, the motion was negatived without a division.—The LORD CHANCELLOR laid on the table his Bill for regulating the Marriages of Presbyterians in Ireland. There had formerly been, he said, some objection raised to this measure, but now all parties were agreed upon it, and he trusted that it would obtain the approbation of their lordships.—The Debtors and Creditors Bill passed through committee on the motion of Lord COTTENHAM; and Lord BROUGHAM's Insolvency Bill was read a second time.

Tuesday.—On the motion of Lord WHARNCLIFFE, the Charitable Donations (Ireland) Bill, and the Leeds Parochial Division Bill, were read a first time.—The Bishop of RIPON paid a just tribute of praise to Dr. Hook, the vicar of Leeds, for his exertions and his generous sacrifice of patronage and emolument, in effecting this measure for the spiritual instruction of the numerous inhabitants of Leeds.—The Slave Trade Treaties Bill was read a third time and passed, after a statement from the Earl of ABERDEEN that though, unfortunately, the slave trade had increased greatly in the island of Cuba since the recall of General Valdez, steps had been taken to remedy that extension, which he hoped would prove effectual.—The Earl of STRADBROKE presented a petition relative to incendiarism in Suffolk; and called the attention of the Government to the uncertain state of the law with respect to the hiring of out-houses.—Lord DENMAN suggested, that as a difference of opinion existed amongst the judges as to this offence being a felony, the law ought to be settled.—Lord WHARNCLIFFE promised to confer with the Home Secretary on the matter.—On the motion of Lord BROUGHAM, the Insolvent Debtors Act Amendment Bill passed through committee.

Friday.—The Earl of CLARENDON called attention to the rumour that Don Carlos was negotiating a marriage between his son and the Queen of Spain. It was well known that there was a party in this country anxious to place the family of Don Carlos in the Government of Spain; and he was sure that Lord Aberdeen was aware how dangerous it would be to give Don Carlos power in Spain, as it would bring back the old church party, who had complete control over the ruthless and fanatical portion of the Spanish population; indeed he was certain a civil war would be the result were Don Carlos to come again into power.—The Earl of ABERDEEN said, that his noble friend might rest assured that in any negotiation of the sort alluded to the honour of this country would be well considered and kept in view by the Government. He would add, that the honour and safety of the present institutions of Spain would also be studied. He had received a letter from Don Carlos by the hands of a noble lord, not a member of that house, in which letter his Royal Highness referred him to that nobleman, and stated that he was in possession of his opinions and intentions on the subject, and capable of describing the nature of the sacrifice which his Royal Highness was disposed to make for the pacification of Spain, which amounted to a renunciation of his own claims to the crown of Spain, on the condition of his son's marriage with the Queen of Spain. This proposition he (Lord Aberdeen) had communicated to the Spanish Government, as well as to that of France; but he had not thought it any part of his duty to press for an answer to his communications. He had previously stated that he had no doubt the return of Don Carlos to the Throne of Spain would introduce civil war into the palace itself, and he had not changed his opinion.—A number of petitions praying for protection to Agriculture were presented.—The Law of Libel Bill was reported, Lord CAMPBELL having postponed the discussion of the third reading in consequence of the absence of Lord Denman.—Lord BROUGHAM moved the third reading of the Debtors and Creditors Bill. [Left sitting.]

HOUSE OF COMMONS.

Friday.—After Mr. DUNCOMBE's motion respecting the opening of letters at the Post-office had been disposed of, the House went into committee on the Sugar Duties Bill.—Mr. PHILIP MILES then proposed his amendment, and told Ministers that if they resolved on no longer affording protection to the West India colonies, they should at once proceed to place the Sugar Duties on a permanent footing, and no longer induce the investment of capital on the faith of a protection which is not to be continued. Coupling this measure with others, it was clear that the thoughts of the Treasury Benches were turned in the direction of free trade; and if so, they should allow the colonies the advantage of the first steps. The time was ill chosen for this experiment on the Sugar Duties, whether the amount of supply or the state of the West Indies were considered; and the temptation of such a market as England for cheaply-raised slave-grown sugar, at so low a rate of duty, would be too powerful for all precautions, and it would therefore be smuggled through New Orleans, and other ports. At present foreign sugar was sold in the market at 18*s.*; and, adding the proposed duty, with the five per cent., it could be introduced at 53*s.* 8*d.*, a price sufficient to throw half the sugar estates in our colonies out of cultivation. Under these circumstances, it was no wonder that they should try to make the best terms they could for themselves. He wished the Chancellor of the Exchequer would pay a visit to his estates in Jamaica, and view a state of things which was the spectre of what it once had been. He begged the agriculturists of England to remember that their cause and that of the West Indians was a common one, the difference being only that while the British farmer grew corn, the West Indian farmer grew sugar; and that if the protection to the one description of agriculture should be abandoned, the protection to the other would soon be at an end. He concluded by moving that from the 10th November the duty on British Colonial Sugar should be 20*s.*; on the sugars of China, Java, and Manilla, 30*s.*, with a duty of 34*s.* upon the foreign Sugars, when imported at a certain degree of refinement; and with an addition, as usual, of five per cent. upon the whole.—Mr. BAILLIE seconded the amendment, remarking that the Government measure disappointed all parties and pleased none.—Mr. EWART was adverse to the general principle of protection, and considered the differential scale proposed by this amendment as even a great deal more objectionable than that of the Government.—The CHANCELLOR of the EXCHEQUER reminded the House that the Government had deferred till next year a general review of our financial condition, and characterised the amendment as not altering the relative amount of protection, but simply proposing to reduce the revenue which the new sugar duties would yield. He repeated his former arguments about the diminution of the supply, and the necessity of keeping down the price, declared his conviction that the amount which would be imported under the Government plan would be too small to have a material effect, and stated that the Government in adopting the uniform differential duty of 10*s.*, were actuated by the consideration that there was a similar relation in price between the brown and the white clayed sugars of Java and the Manillas, as existed between the same class of sugars of colonial growth. He would not be deterred by the taunt of free trade from proposing a measure which was intended equitably to reconcile the conflicting interests of consumer and producer, as well as affording a sufficient protection to the West Indies. The feeling of this country was too strong to be resisted, that the time had now arrived when individual interests must give way to the general benefit of the community.—Mr. LABOUCHERE, after careful consideration, preferred the plan of Mr. P. Miles to that of the Government, and would therefore support the amendment. If the Government were merely bringing it forward as a temporary measure, in order to bolster up their revenue until next year, when, with an overflowing exchequer they would effect other and greater changes, there never was an interest so infamously treated as the West Indian. So fallacious was the idea of keeping up a distinction between free-grown and slave-grown produce, that it appeared from a price current, that the bare rumour of the intention to admit free-grown into this country had raised the price of slave-grown in Cuba, because it was conceived that its position would be improved in the general market of the world.—Mr. GODSON, Mr. BOUVERIE, Mr. GLADSTONE, Mr. M. GIBSON, Mr. ESCOTT, and others, supported the Government proposition; Mr. BERNAL, Mr. BARING, Mr. HUME, Mr. COLQUHOUN, and Mr. HAMPDEN, supported the amendment at some length, and in the midst of great impatience.—Lord J. RUSSELL did not blame the Government for proposing a reduction of duties, but he blamed the mode in which they proposed to effect it. The amendment would leave the protection as under their proposition, while it would cause a reduction of 9*s.* the cwt. to the consumer; and this benefit, giving an additional spring to consumption, would counteract any trifling loss to the revenue. It was not certainly a complete settlement of the sugar question, any more than the Government proposition, but it was better to all concerned.—Mr. H. BERKELEY would support the amendment, if the four extra shillings on the white clayed sugars were dropped.—Mr. P. MILES replied, and after a few words from Captain GLADSTONE and Mr. RICARDO, on a division, there appeared—For the amendment, 241: Against it, 221; Majority against Ministers, 20.—On the numbers being announced, there was considerable cheering; and Sir R. PEEL said that it would be the more convenient course to allow the chairman to report progress, and resume the discussion, as the first order of the day, on Monday, when he would state the course he should pursue.

Monday.—The SPEAKER informed the House that he had received a letter from the agents on the petition against Mr. Bouverie's return for the Kilmarnock burghs, stating that it was not their intention to proceed with the petition.—The House resolved itself into a committee on the Sugar Duties Bill.—The Government proposition having been negatived by the vote of Friday night last, Mr. Miles's amendment to that proposition stood as the substantive motion before the committee.—Sir R. PEEL moved that the House should go into committee on the Sugar Duties Bill; which having been done, he proceeded to make his statement as to the view taken by Government of the position in which it has been placed by the vote of Friday. He commenced by sketching the policy pursued by this country with respect to the slave trade and slavery, viewing it in the light of one of the greatest evils and curses on humanity. The chief onus of suppressing it had fallen on this country: for this we had made great sacrifices; and only last session an act was passed, more stringently preventing the employment of British capital in the trade, and, therefore, showing what was the whole tenor of our policy. Men of the most opposite opinions concurred in considering that, with reference to slavery, sugar should be taken out of the ordinary principles of commercial legislation. Hitherto our efforts to suppress the slave trade between the coast of Africa and Cuba and the Brazils, have been ineffectual; and to open the sugar trade between Great Britain and these countries would only aggravate the traffic and defeat their efforts. But by giving encouragement to the free-labour sugars of the Manillas, Java, and perhaps China, we would strike a blow at the slave-trade, and ameliorate the condition of the slave, even if one consequence should be a slight stimulus to the production of slave-grown produce. Government felt it necessary to decide during the present year on the course which they should adopt with respect to sugar; our treaty with the Brazils expires on the 10th November next; and the reasons by which they were actuated in bringing in their present measure, and deferring a more general consideration of the subject till next year, were three. First, the income-tax expires next year, and the full operation of the tariff, which was imposed in conjunction with it, would not be distinctly ascertained till that time—as, for instance, the full reduction in the timber duties did not take effect till October last. This fact is to be taken along with the general revival of trade and industry, which, however gratifying, might not be permanent; if it were, next year would give them positive assurance. Secondly, there was the great financial operation, the reduction in the Three-and-a-Half per Cents., of which it was of great importance to secure the success; and thirdly, if the income-tax were renewed next year, a revision of the sugar duties would have been considered as one of the conditions of it. The indications of rising price, and the fear of a deficient supply, led Government to introduce their present proposition; the sugar monopoly was the only one that remained (a voice—"Corn"); and they considered that, without detriment to the revenue, or injury to the West Indies, their measure was calculated to be of great advantage to the community at large. They wished to ascertain, before next year, if Parliament would sanction and establish the distinction between free labour and slave labour; and they adhered to their opinion that their own proposition was better than the one proposed by Mr. Miles. The distinction he had drawn between muscovado and white clayed sugars was one, if adopted, which ought also to be introduced into our colonies. After mature consideration, they could not adopt the amendment with the view of escaping from their difficulties, because they were of opinion that while it would not benefit either the consumer or the West India interest, it would be detrimental to the revenue. To prove this he entered into details, taking the effect of the reduction on the timber duties by way of illustration; and then, pointing out that the amendment would create a differential duty of 14*s.* on certain sugars, while the Government measure only gave 10*s.*, emphatically repeated that they would not escape from their difficulties by giving increased protection to the West Indies. He then read extracts from letters which he had received that morning, from individuals largely engaged in the sugar trade, in which the writers pointed out that by adopting the higher duty on the white clayed sugars, great injury would be the consequence. There were sugar refineries established at Calcutta and in Demerara, which manufactured a refined sugar, which, while it would escape the duty on the white clayed, was largely superseding its use. Refusing to adopt the amendment on its commercial merits, neither could they adopt it on political grounds. It had been carried by a combination of a portion of the supporters of the Government with their political opponents, and however unimportant the matter itself might be, it had an important bearing, as indicating a want of confidence in the Executive. He did not complain of the combination, though he believed it to have been preconcerted. Members had a perfect right to act as they pleased, but if the Government acquiesced in the vote of Friday night, it would only be an encouragement to similar attempts. Though not disposed to take offence, he could not but complain of the harsh terms which Mr. Miles and his seconder, Mr. Baillie, had used. The Government had been told to "throw off the mask;" and they were accused of having struck a blow at Australia, by the reduction of the duty on wool—the fact being, that a few days ago, the first sales of Australian wool since the reduction had been greater than ever before known. By the vote of Friday the Government proposition had been rejected; the amendment of Mr. Miles had yet to be proposed; and he would then give the House the opportunity of reconsidering their vote, by restoring the duty of 24*s.* on colonial sugar. After adverting to the general state of the legislative measures of the Government, and expressing his fears that the close of the present session would be marked, like the last one, by the abandonment of many of them, he lamented the want of cordiality between the Government and many of its usual supporters, but would not conciliate them by holding out the prospect of taking a different course. They had taken office with the view of not only maintaining, but of improving, existing institutions, and of gradually relaxing the system of protection. They had been defeated in the House of Lords on a question which, though appearing isolated, was in reality not so; it was a portion of that ecclesiastical renovation which circumstances required. Seeing, therefore, that the policy of the Government was one of gradual improvement, and that they could not hold out any expectation of an alteration in it, he concluded by intimating that important consequences might be the result of the decision of the House.—Lord J. RUSSELL remarked that Sir R. Peel was about to renew the proposition which, on Friday night, a majority had rejected. These were terms never before submitted to a House of Commons; the Minister asked his usual supporters to surrender all free will or independent judgment, and by acquiescing implicitly in the Government propositions, to exhibit themselves degraded in the eyes of the country? Why should Sir R. Peel, who had certainly not been brought into office as a free-trade Minister, compel his friends who were in favour of protective principles to abandon their conscientious opinions? As to any "political combination," the history of this "secret conspiracy" was simply this—that Mr. Labouchere had called his attention to Mr. Miles's amendment, of which he had previously been unaware, and they determined to support it as the best of the two propositions. The "political combination" was rather to be found in the Ministerial camp. He admitted that there was some force in the argument, that the distinction in the amendment as to white-clayed sugars should, if adopted, be also introduced into our colonial; but for the House deliberately to rescind their vote, would be a melancholy proof of subserviency, and by submission on the present occasion to the overbearing conduct of Sir R. Peel, their independence would be gone for ever.—Mr. MILES thought that Sir R. Peel might have deferred to a majority of the House, and have postponed till next session any further consideration of an alteration in the sugar duties. By not doing so, he placed them in the painful position of either abandoning their support of the West India interest, or of withdrawing from the House. He, however, would persevere, and accordingly moved that the duty on colonial sugar be 20*s.*—Sir R. PEEL then moved, as an amendment, that it should be raised to 24*s.*—Sir G. GREY asked if Sir R. Peel meant to restore the duty on free foreign sugar to the original government amount?—Sir R. PEEL replied that such was his intention.—Mr. B. COCHRANE said that, though he had voted for the Government on Friday, he could not give them his support on this occasion, because their conduct towards their usual supporters had changed the question from one of sugar duties into one of the independence of the House, and the personal honour of their friends.—Mr. KEMBLE expressed his intention of voting against Mr. Miles's proposal, though on the former night he had not voted at all, because he had not then been able to satisfy his mind either as to the Government's or Mr. Miles's motion.—Sir H. DOUGLAS likewise stated his intention of voting against Mr. Miles's motion, though he still objected to the Government amendment, and should also vote against it when put.—Mr. LABOUCHERE supported the insertion of 20*s.* in the clause, and denounced the attempt of the Government to intimidate the House of Commons as unheard of and unjustifiable.—Mr. DISRAELI congratulated the House that the Minister, instead of resigning, had merely moved an amendment. The precedents for rescinding a vote applied only in cases of rare and imperious necessity. There seemed to be some fatality, when the House was called on to do this twice within one month. Sir R. Peel ought to have a little more feeling for his followers, and not to drag them through the mire without need. To call upon them to rescind one vote per session was enough. Ministers should not lightly say to their friends, you shall submit to public disgrace, or we must submit to private life. Sir R. Peel came forward with an utter detestation of slavery in every place except upon the benches behind him. After the vote of Friday, and the rumours of the last 48 hours, it was somewhat ridiculous, on this short notice, to be called on to rescind a vote. The same disgrace might soon recur; better that it should terminate now, than that Sir R. Peel, who was worthy of higher things, should continue to stand by threatening his friends and cringing to his opponents. He himself, therefore, would not follow the example of Sir H. Douglas.—Lord SANDON adhered to his vote for Mr. Miles's motion, notwithstanding his regret that Government had a minority on the Sugar Duties, and the Bishopric in North Wales; and notwithstanding that they were expected to discontinue their services to the country.—Mr. SHEIL supported the duty of 20*s.*, as that which would cheapen sugar to the consumer.—Mr. GOULBURN followed, against Mr. Miles's motion; and Mr. P. M. STEWART against it.—Mr. ENTWISLE explained, that having voted against the Ministerial proposition, because he did not think it gave adequate protection to the West Indies, he should on this occasion decline to register his vote—"because he did not believe the interests of the West Indies would be safe for a moment in the hands of gentlemen opposite."—Mr. ESCOTT could not understand how Mr. P. Miles and his supporters could reconcile the two objects of protecting the West Indians, and at the same time increasing the supply of sugar. He challenged Mr. Miles, of Somersetshire, to show in what way the West Indians could be benefited by his relative's proposal. He inveighed against monopoly in general.—Mr. MILES (Somerset) attacked Mr. Escott for the inconsistency of his present declarations with those which he had made more than once at the hustings of Somersetshire. However, the Somersetshire men were not disposed to measure their corn by the "Winchester" bushel. He then advocated Mr. P. Miles's proposal on its colonial and general grounds, and demanded protection with reference to the present impracticability of procuring free labour. He adhered to his own Conservative opinions, and he believed he did more to uphold that party by an independent course, than by a blind subserviency.—Lord HOWICK contended for the 20*s.* against the 24*s.* duty. He denied that the forms of the House were meant to give an opportunity for rescinding a vote; what they were meant for was to prevent a surprise. It was quite a new doctrine that the Government were entitled to go out whenever their supporters differed from them. At that rate all which the House of Commons would have to do would be to pass a vote of confidence in the Government at the beginning of the session, and then quietly disperse to their homes. The threat of resignation was

one which Ministers could not fulfil. They had no right thus to announce their responsibility to the great party who placed them in office. Least of all could they go out upon so slight a question as a difference of 4s. in a duty. It was no doubt most unfortunate that their party differed from them upon certain important questions of trade and finance; that their party had brought them into office without a clear understanding of their own opinions on these subjects; that their followers supported them, not because they liked them, but because they more disliked the persons likely to succeed them. He called upon the Government to take one line or the other upon these great principles of free trade, and not halt any longer between two opinions. And he called on the agriculturists themselves, either to make a Government of their own which would enforce their own views, or if they felt that public opinion rendered this impossible, then to yield to that public opinion, and desist from their opposition to the judicious attempts of the Government.—Lord NORTHLAND said he had voted against the Government measure on Friday, and would not change his vote now.—Lord STANLEY defended himself and his colleagues against those who called themselves the supporters of Government. He admitted those general principles of free trade which Lord Howick had enunciated; everybody admitted them; but the whole science of a statesman lay in knowing when and how far to apply them. Lord Howick had represented the Government as having many supporters who acted chiefly on the feeling of a greater dislike to their opponents. But had not that been the case with the Whig Government, of which Lord Howick had been a member? Must it not be the case, was it not the necessary condition of every free Government? He then entered into the merits of Mr. Miles's plan, as affecting the consumer, who, he contended, must thereby inevitably pay a higher price from this time to November, without one shilling gained to the planter, and with a great loss to the revenue. No Member of the Government presumed to dictate to the House; but the Government had a fair right to claim from their supporters a liberal construction of their motives, and even some deference to opinions formed upon more matured information than was usually open to individuals. The Government had a fair right to claim that there should not be a reaction upon themselves of the resolutions which they had proposed as a preliminary to the vote of want of confidence whereby the late Government were displaced. No Ministry was bound to hold office against its own conscience and feeling; and he knew with what acrimony this Government would have been assailed if it had attempted to adhere to office after the manner of its predecessors. He concluded by cautioning his friends how they united with those who aided them on this occasion only for the purpose of overthrowing the Government.—Lord PALMERSTON treated as a gross absurdity, and as quite unsustainable in practice, the distinction between free and slave-grown sugar. He admitted that if there was a case in which an exception might be allowed from the principle of free trade, it was the case of the West Indians; and he preferred the proposal of Mr. Miles as likely to occasion a sensible diminution in the price of sugar. But the commercial view of the subject sank into utter insignificance in comparison with the other issue taken by Government, who had used to their supporters a threat very unbecoming for them to employ. Their present doctrine was wholly different from that of Sir R. Peel in 1835, when he declared, that having undertaken the Government, he was bound to persevere, in spite of the many adverse votes then encountered by him, until he found it impossible any longer to conduct the Administration. If a Government was to resign, alike whether the question were important or unimportant, the House was a mere assembly for registering the edicts of the Government. Ministers would have acted more constitutionally to appeal to the country; or, if they believed that they had lost the country's confidence, that might have been a legitimate and valid ground of resignation. He inveighed against the dishonour of rescinding the Friday's vote. Away with the pretext that it was necessary to rescind that vote for the purpose of proving confidence in Government; if a vote refusing confidence to them were proposed to-morrow, it would be negatived by a majority of 90 or 100.—Mr. S. O'BRIEN and Colonel SIBTHORP supported Government.—Mr. M. GIBSON maintained the opinions he had expressed on Friday night. The measure of the Government was the more liberal of the two, and should have his vote.—Mr. ROEBUCK would vote with the West Indians, in order to benefit the consumer. He should be sorry to see the Government go out, but his duty was to look to the consumer.—The committee then divided—Against Mr. Miles's proposal, 255; For it, 233; Majority against it, 22.—The proposal to insert 20*s.* per cwt. in the clause having thus been rejected, the amendment of the Government to insert 24*s.* was about to be put, when Mr. MILES arose, and announced his resolution, after the opinion expressed by the committee, not to press his motion farther.—The Bill, therefore, passed through committee (with the exception of the third clause, which was postponed).

Wednesday.—The Sergeant-at-Arms having announced that the Lord Mayor and Corporation of Dublin were in attendance, the Speaker directed him to call them in. The civic functionaries, attired in Court suits, and wearing also their robes of office, immediately entered, and the Lord Mayor advancing to the bar, delivered in a petition, and, having made obeisance, retired. On the motion of Mr. T. Duncombe, the petition was read. It stated that Daniel O'Connell, an hon. member of that House, John O'Connell, also an hon. member of that House, and five other gentlemen, had been convicted on grounds which appeared to the petitioners to be totally opposed to constitutional principles. The petitioners also stated their conviction that the parties had not had a fair trial, and that the law of conspiracy, as laid down on the trial, was wholly subversive of the liberty of the subject. They also stated their opinion that the trial itself had not been conducted on just and fair principles, and that a course had been pursued which had greatly prejudiced the prisoners when on their trial. All these proceedings the petitioners held to be detrimental to the administration of justice, and they therefore prayed the House to take the law of conspiracy into their serious consideration, and to preserve inviolate the right of free discussion. These allegations were loudly cheered from the opposition benches.—Mr. WYSE then gave notice that he will bring on his motion relative to the Irish state trials on the 2nd of July.—Another notice of importance was given by Lord PALMERSTON, that, on the 16th July, he will bring the present state of the West Indies under the consideration of the House.—The first order of the day was Mr. Stafford O'Brien's "Vestries in Churches Bill," which proposes to confer a power of holding vestry meetings in other places than churches, by license of the bishop, and otherwise alters the ecclesiastical law affecting vestries. The object, last night, was to get the Bill into committee *pro formâ*, in order to effect sundry alterations in details, with the view of rendering the measure less objectionable.—Mr. HUME, however, objecting to the Bill altogether, moved that the House go into committee on it "that day six months."—The debate which followed was exceedingly animated, many members on the Government side of the House concurring with the Opposition in resisting the further progress of the measure.—Sir J. GRAHAM declared himself, since the last discussion, a convert to the principle of the Bill, though he still thought its details required alterations. He offered Mr. O'Brien the aid of the Law Officers of the Crown in making the necessary amendments, and for that purpose suggested the committal *pro formâ*.—The SOLICITOR-GENERAL said that circumstances had come to his knowledge within the last two or three days which convinced him that some such Bill was necessary. Its object was to prevent those scenes of disturbance which occasionally occurred at vestry meetings, which desecrated the sacred edifice where they were held; and he was one of those who never entered a church without a feeling of awe and reverence.—A number of members took part in the discussion, amongst whom, Captain ROUS said he was one of those who put faith in mankind, and hoped that we were advancing in civilisation every day. He, therefore, would be content with what satisfied our forefathers, and would not insult every ratepayer by sanctioning humbug.—Mr. WAKLEY remarked on the odd circumstance that the First Lord of the Treasury had expressed his unqualified disapprobation of this Bill a few nights ago: yet that, so soon after, the Home Secretary came down to the House to support it. Referring to an expression used in the debate that the proceedings which sometimes took place in churches contaminated the very walls of the buildings, he said he should like to know in what condition the walls by which they were then surrounded were after the proceedings of the last few nights? If disgraceful, immoral, and hypocritical proceedings can contaminate walls, it was actually dangerous to human life to venture within the walls of that House of Commons. The House divided—For going into committee, 87; against it, 73; majority, 14.—Mr. HUME, not content with this division, moved the adjournment of the House, which was seconded by Mr. ROEBUCK, who considered it best to transact church business in the church than amidst the fumes of beer and tobacco at the Magpie and Stump or the Red Lion.—Sir R. PEEL pointed out two or three particulars in which he should wish to see the Bill altered, but contended for going into committee.—Mr. SHEIL wished to know why the Bill, if of any value, was not extended to Scotland and to Ireland.—Mr. WATSON opposed the Bill, and asked those who talked of desecration, what they thought about the practice of taking a twopenny fee for admission into St. Paul's? Mr. ESCOTT pressed Mr. O'Brien to assign his grounds for such a Bill.—Mr. SHAW stated some local reasons why the Bill would not be usefully applied to Ireland, but supported it as applicable to England.—Mr. WAKLEY thought the Bill would be as mischievous in England as in Ireland. He supposed Sir R. Peel was supporting Mr. O'Brien from gratitude for that hon. member's speech upon the sugar duties. The Government should bring in a Bill of their own, and not graft their clauses on this.—Mr. O'BRIEN replied that he did not see any necessary indecorum in a meeting at a public-house. Perhaps the members for Bath and Kinsale knew more than he did about public-house meetings. The Government owed no gratitude to him respecting the sugar-duties: the division lists would show that his had been *nox et præterea nihil*. The House divided—Against the adjournment, 83; for it, 75; majority against it, 8.—Mr. HUME, relying on the smallness of the majority, moved another adjournment.—Mr. WAKLEY supported this motion.—Mr. M'GEACHY regarded the Bill as an indictment against the whole people.—Lord PALMERSTON counselled the Government to let the debate be adjourned, and then bring in a Bill of their own, if any Bill at all appeared to them to be necessary.—Upon this, Mr. S. O'Brien himself, to rescue his Bill, moved "that the House do *now* adjourn." This was received with acclamation, and the House instantly rose.

Thursday.—Captain LAYARD asked the Premier if it were true that Earl de Grey had resigned the Lord Lieutenancy of Ireland?—Sir R. PEEL replied that "there was no truth whatever in the report," but added that, at the same time, he did not mean to say that Lord De Grey's state of health had not for some time past made him anxious to be relieved from his present office. At a later period of the evening Sir R. Peel further qualified his first statement by announcing that an immediate change in the Irish Government was in contemplation, but that it was solely in consequence of Lord de Grey's ill-health.—The House went into committee on the Sugar Duties Bill. On the first clause—which admits the sugars of China, Java, and Manilla, as free labour foreign produce, and which gives power to the Government, by an Order in Council, to give admission to the sugars of other countries, which it may hereafter decide not to be tainted with the slave-trade—a long discussion took place, in which several Members attacked Mr. Gladstone for the ignorance, inconsistency, and impracticability displayed in the framing of this measure.—Mr. P. M. STEWART insisted that the sugar of Java was produced by forced labour, and that China was not free from slavery.—Mr. GLADSTONE denied the correctness of Mr. Stewart's information, and asserted that the Government did not intend to interfere with domestic slavery, but only with the slave-trade.—Lord PALMERSTON charged the Government with inconsistency and worse than hypocrisy. They had formerly stated their object to be to put down slavery, but now they shifted their ground and said they only wanted to put down the slave-trade—fostering domestic slavery, which it was ridiculous to suppose could exist without some trade in slavery.—Mr. LABOUCHERE dwelt upon the utter impracticability of maintaining the distinctions attempted by the Government.—Mr. HUME could not understand what the clause meant, and stated his firm belief that the Government themselves did not know what they meant. As he could not get them to lay down any principle by which they would decide whether a country was or was not tainted with slavery, he moved the postponement of the clause.—After a series of attacks on Ministers for the late anti-slave majority obtained by what Mr. Hume called the twelve "free-traders *par excellence*," the amendment was withdrawn and the clause agreed to.—On the 4th clause, which related to the certificates of the origin of sugars imported, Lord PALMERSTON divided the committee. There were—For the clause, 114; Against it, 60; Majority for the clause, 54.—On the 7th clause, Mr. F. BARING asked, How could the Government refuse admission to sugar, the produce of Danish colonies on the same terms as sugars the produce of Java, without violating the ancient treaties between this country and Denmark?—Mr. GLADSTONE replied, that if on more mature, or rather official information, it should appear that Denmark sugar ought to be admitted at the low duty, Her Majesty would have full power to give effect to the treaties between this country and Denmark.—This and the remaining clauses of the Bill were, after further discussion, agreed to. The preamble was then proposed, in which, according to usage, it is stated that the House "freely and voluntarily" granted the said scale of duties to Her Majesty.—Mr. T. DUNCOMBE moved that "freely and voluntarily" be struck out. Sir R. Peel, taking advantage of the Whigphobia of his side of the House, compelled them to rescind on Monday the vote of Friday. He did not complain of the Minister; he treated his supporters exactly as they deserved. But they were rendering the House the laughing-stock and contempt of the country. Did Sir R. Peel consider the vote of Monday night one of confidence? He was kept in office by eleven free-traders, who refused to reduce the West India Protection when one of that interest proposed that it should only amount to 20*s.* He had heard working men at public meetings accused of being "Tory tools;" he would like to know who were now the "Tory tools?"—Sir R. PEEL commented on various blunders made by Mr. T. Duncombe in the course of his observations, whose capacity for forming a competent judgment he, therefore, disputed. The protection proposed by the Government was not 20*s.* but 10*s.* Lord Althorp, on one occasion, had asked the House, on financial considerations, to reverse its decision on the malt-tax; and it was on financial considerations that he had asked for a reversal of the vote of Friday. But he disclaimed the use of all arrogant language towards his supporters; it was not a question of a difference between 20*s.* and 24*s.*, but because he thought that it indicated a want of confidence, when he intimated that another defeat might lead to a resignation. He acknowledged the generous support of his friends; and hoped that whatever disunion Mr. T. Duncombe might foment on his own side of the House, he would be unsuccessful in disturbing the harmony and union of the Ministerial benches.—Mr. LABOUCHERE congratulated Sir R. Peel on the more cheerful tone he had adopted, and trusted that his present sentiments indicated that he felt his language on Monday night not to be of the character which a British Minister should address to a British House of Commons. Mr. Miles had acted a manly part in proposing his motion on behalf of the interest he represented, and a prudent one in modifying it so as to secure the support of the Opposition consistently with principle.—Mr. T. DUNCOMBE was satisfied with the discussion he had raised, and would not press his amendment to a division; and seeing that Sir R. Peel had, in fact, retracted his sentiments uttered on Monday, he claimed for himself, not the stigma of a fomentor of discord, but the character of a peacemaker.—Mr. ROSS then charged the supporters of the Government with being whipped spaniels.—Mr. BRAITHWICK said, there were two kinds of spanielship, one that dreads the threats of a Government, and the other that dreads unpopularity. The Hon. Member had acted like a genuine spaniel on the Factory Bill, although he now stands on his hind legs, and charges us with following his example.—Mr. ROSS said, the fact was true, but he denied the inference.—Colonel SIBTHORP. Sir—As the Hon. Gentleman ventured to call Hon. Gentlemen on this side of the House spaniels, I shall take the liberty of saying this, that I prefer being a spaniel to an ill-bred cur.—The report of the Sugar Duties Bill was fixed for Friday evening, the Dissenters' Chapels Bill to be taken after.—The Prisons (Scotland) Bill passed through committee.—The Linen &c. Manufacturers' Bill was read a second time.—On the motion, to agree to the Lords' amendments to the Night Poaching Bill, Mr. ESCOTT moved that the amendments be read that day six months. The House divided—For the Bill as amended by the Lords, 63; against it, 12; majority, 51. The Bill was read a third time and passed.—On the motion of the SOLICITOR-GENERAL, leave was given to bring in a Bill to disfranchise the borough of Sudbury.

Friday.—The Lords' Amendments on the following Bills were read and agreed to:—The Nottingham (West Croft Canal) Improvement Bill, the Chester and Holyhead Railway Bill, the North British Railway Bill, the Manchester Improvement Bill, and the Salisbury Branch Railway Bill.—The London and South-Western Railway Bill was read a third time and passed.—After numerous petitions had been presented on various subjects, Mr. GREENE brought up the report on the Sugar Duties Bill. On the motion that the report be received, Mr. EWART, in the unavoidable absence of Mr. Hume, moved "that slave and free-labour sugar be admitted upon the payment of equal duties," and addressed the house at considerable length in support of his motion.—Mr. JAMES said it was utterly impossible for the West Indians, fettered as they were at present, to compete with the growers of slave-labour sugar. He was surprised to hear the opinions some gentlemen entertained on the subject, but he thought that he should live to see the day when he should not be surprised at anything which took place. It was clear that hon. Members did not understand the bearing of the sugar duties on the West India interest. He must oppose the motion.—Mr. BARCLAY said he gave credit to the Government for their intention to put down slavery, and he could not, therefore, support the motion.—The House divided, when there appeared—For Mr. Ewart's motion, 65; against it, 183; majority for Ministers, 118.—In answer to Lord J. RUSSELL, Sir R. PEEL said he intended to proceed with the committee on the Bank Charter Bill on Monday next.—The Report on the Sugar Duties Bill was then brought up and agreed to, the Bill ordered to be engrossed, and read a third time on Monday.—On the order of the day being read for going into committee on the Dissenters' Chapels Bill, Mr. PLUMPTRE strongly opposed the measure.—[Left sitting.]

CITY.

Money Market, Friday.—Consols for the opening, closed at 98⅝. Ex. div. Red. Three per Cents. 99¼. Three-and-half per Cent. 102⅛. Exchequer Bills 73 to 75 pm. Bank Stock 197½.

GAZETTE OF THE WEEK.—BANKRUPTS.—J. HOLLAND, Buxted, draper—T. LEAVER, Great Coxwell, Berkshire, baker—W. E. DRAY, Heathfield, grocer—H. and J. PEACOCK, Durham, grocers—G. STENT, Southampton-street, Camberwell, builder—J. SMITH, Southampton, coal and corn-merchant—W. MOWBRAY, Wheathampstead, Hertfordshire, butcher—M. SWEETLAND, John-street, Fitzroy-square, baker—J. TUCKER, Sutton-street, Commercial-road East, ship owner—G. CRAVEN, Wakefield, wharfinger—E. HERON, Hartlepool, Durham, butcher—G. HARWOOD, Chester, draper.

BANKRUPTCY ANNULLED.—F. H. WARD, Arbour-terrace, Commercial road, tallow-chandler.

SCOTCH SEQUESTRATIONS.—J. BRYSON, Drumcrosshall, Lanlithgow, grazier—J. RUSSELL, Leith, builder.

Metropolis and its Vicinity.

Meeting of Conservative Members.—A numerous meeting of the Conservative members of the House of Commons was held in the drawing-room of the Carlton Club on Monday morning. Before 12 o'clock upwards of 200 members had assembled, and many others entered the room afterwards. Sir J. Y. Buller presided, and in reply to Mr. D'Israeli, Lord Ingestre stated, that he, in conjunction with Mr. Forbes Mackenzie and the other requisitionists, had thought it advisable, after the vote of Friday night, that there should be a meeting, and had accordingly issued a notice convening it. A vote of confidence in Sir R. Peel's Government was then proposed with the view to prevent his resigning office.—Mr. Ferrand asked whether it was expected that the 60 Conservatives who voted with Mr. Miles in opposition to the government on Friday night were expected to rescind their votes.—Mr. Christopher said that he was one of those who had voted against Sir R. Peel on Friday, but he was still prepared to sign a declaration of confidence in the government, rather than let in the Whigs.—Lord Sandon professed himself willing to sign a general declaration of confidence, reserving to himself, however, a right of private judgment.—Sir H. Douglas was prepared to vote unlimited confidence.—Mr. Blackstone declined to support so extensive a declaration.—Mr. Blakemore said that the meeting was one of Conservatives, and he was surprised therefore at Mr. Ferrand's presence.—Mr. D'Israeli challenged Mr. Blakemore to a definition of Conservatism, but Mr. Blakemore declined the task.—Several members expressed their dread of a declaration of "unlimited confidence," as they were quite in the dark as to the minister's future measures, and knew not which interest might next be assailed.—The *Standard* ministerial paper states that a resolution of entire confidence in Sir R. Peel's government was ultimately carried unanimously, and the resolution forwarded to the right hon. baronet in Whitehall Gardens, previous to the assembling of the Cabinet Council.

Waterloo Banquet.—Tuesday, the 18th inst., being the anniversary of the battle of Waterloo, the Duke of Wellington gave his customary banquet at Apsley-house, to those surviving field-officers who participated in that memorable engagement. Long previous to the hour of dinner, the gateways in Piccadilly were crowded by persons, of all grades, anxious to obtain a glimpse of the distinguished veterans who were to assemble at the banquet. By 7 o'clock some hundreds had congregated;

and not only were there a number of noble equestrians mustered, but likewise many carriages of the nobility, which rendered that crowded thoroughfare nearly impassable. Shortly before 7 the carriages began to arrive, and while the company were gathering, the band of the Grenadier Guards (the Duke's Regiment), stationed in the vestibule, performed a variety of martial music. The Marquess of Anglesey, Lord Strafford, Lord Saltoun, &c., on being recognised by the crowd, were warmly cheered. Prince Albert arrived about half-past 7, and the company soon afterwards sat down to dinner. The Duke of Wellington was supported on the right by his Royal Highness, and on the left by Prince Castelcicala, the Neapolitan minister, who was an officer at Waterloo. The Marquess of Anglesey sat on the right of Prince Albert. The Duke and Prince wore the full uniform of field-marshals. The number of Waterloo officers present was 66; including 3 generals, 6 lieut.-generals, 13 major-generals, 35 colonels, and 9 lieut.-colonels.

City of London Wellington Statue.—On Tuesday, being the anniversary of the battle of Waterloo, this statue, placed in the open space between the New Royal Exchange and the Mansion House, was thrown open to the public. The King of Saxony was at breakfast with the Lord Mayor at the Mansion House, when Mr. Masterman, M.P. for the city, and Sir Peter Laurie, unceremoniously appeared in the middle of the breakfast, as a deputation from the Exchange and Gresham committee, to notify that they were about to open the statue of the Duke of Wellington, and to request his Majesty to honour them by witnessing the ceremony. The King, on hearing the Duke of Wellington's name, expressed his desire to be present on an occasion of doing honour to his Grace, and proposed to the Lord Mayor and the ladies and gentlemen at the table, to proceed immediately to the spot. At this moment the streets of the neighbourhood were not only densely crowded, but the windows and tops of the houses in the adjoining parts of Cornhill, Mansion-house-street, the Poultry, King William-street, and Prince's-street, were occupied by multitudes. The King walked arm in arm with the Lord Mayor, followed by his Lordship's guests, through masses of people from the gates of the Mansion-house to the entrance to the space assigned for the chairman and committee, and was most warmly received. The band struck up the National Anthem as the King of Saxony entered the space before the statue, and the committee received his Majesty with acclamations. The King appeared to be surprised at the scene, and declared that he never beheld such an extraordinary multitude. The committee walked twice round the statue, the covering of which was removed instantaneously amidst cheers from all around. Mr. R. L. Jones then made a long speech on the claims of the Duke of Wellington on the gratitude of the city, and at its close, three cheers were given for the Duke, the King of Saxony pulling off his hat, and joining as heartily in the cheering as any one in the assembled multitude. The daily papers agree in stating that some strange mismanagement seemed to prevail amongst those who had undertaken the inauguration of the statue. The whole affair appeared to be in confusion, and the intrusion of a deputation into the Mansion-house to request without delay the presence of the King and the Lord Mayor, at the moment they were partaking of the repast provided by his Lordship, was as uncourteous as it was ill-timed.

Death of Mr. Thomas Campbell, the Poet.—We regret to record the death of this distinguished poet, which took place at Boulogne on Saturday last, the 15th inst. Mr. Campbell was a native of Glasgow, and was in his 64th year. As the author of the "Pleasures of Hope," and of those spirit-stirring lyrics in which he has immortalised some of the most brilliant achievements of our navy and army, Mr. Campbell's fame is known wherever the English language is spoken. There is nothing of their kind in the whole range of our literature equal to the "Battle of the Baltic," "Ye Mariners of England," and "Hohenlinden," and Lord Byron's regret that Mr. Campbell did not write more, is felt by all classes of his admirers. Mr. Campbell was confessedly the first poet of our time, and we are glad to find from a correspondence between the Dean and Chapter of Westminster and his executors, that his remains will be interred in Poet's Corner, in Westminster Abbey.

General Post-Office.—The debate on Mr. Duncombe's motion relative to the practice of opening letters at the Post-office has directed attention to the subject, and is likely to bring it still more prominently before the public. The *Morning Chronicle* of Tuesday states, and challenges contradiction to the fact, that during the Secretaryship of Sir F. Freeling, the opening of letters posted in London for the Continent, as well as those from the provinces, passing through the Foreign-office, was carried on to a great extent, and a correspondent of the same paper states that he knows to a certainty that there are now in the Post-office more than one individual who, in carrying letters and packets which had been opened and re-sealed in the "Espionage-office," to the Inland-offices have found the wax on letters and packets sticking to their hands, from its not having had sufficient time to cool. The "Espionage-office" was then situated on the south-west corner of the Post-office, and is now partly used as the Money Order-office.

The Waverley Ball.—A grand fancy dress ball is in contemplation, in which the leading characters of Sir Walter Scott's novels are to be sustained. It is said that measures have been taken by the Duchess of Buccleuch, with the concurrence of the Queen, to promote with her Majesty's influence the getting up of this *fête*. The ball, it is asserted, will partake more of a private meeting than a public assembly, as admission will be only granted through a lady patroness. The surplus fund goes towards the completion of the Scott monument at Edinburgh.

Court of Aldermen.—The name of Mr. Thomas Johnson, Alderman of Portsoken Ward, having appeared in the *Gazette* in the list of bankrupts, the citizens expect that his gown will be immediately resigned into the hands of the constituency. Already the following gentlemen have declared their intention to offer themselves for the office, in the event of the resignation of Alderman Johnson:—Mr. David Salomon, Mr. Sheriff Moon, Mr. Pilcher (one of the late Sheriffs). Mr. Bishop, of America-square, and Mr. Harvey, Commissioner of City Police.

The Shrievalty.—Alderman Challis has applied to be excused from serving the office of Sheriff for the ensuing year; and the application will no doubt be assented to, as Alderman William Hunter has consented to serve the office. His colleague is not yet decided on, but it is said that the following gentlemen are desirous to serve, viz., Mr. Barber, Wharfinger, the Master of the Drapers' Company; Mr. Caldicot, of Cheapside; and Mr. Milne, of Park-street, Grosvenor-square.

Wood Pavement.—On Tuesday, at the Court of Sewers, it was resolved, by the Chairman's casting vote, to pave the south side of St. Paul's Churchyard and Fleet-street with wood, on the principle adopted at the west-end of Cheapside, and to pave Ludgate-hill with granite, on the plan of London and Blackfriar's Bridges.

New Zealand Company.—An adjourned meeting (eleven in number) of the Directors and Shareholders of this Company was held on Friday. Mr. Aglionby, M.P., presided; and said that under the charter they had been called together on the 31st May last, but the Directors recommended at that time, by reason of certain circumstances, that the meeting should be adjourned to that morning. The recommendation was agreed to, and they had met accordingly by adjournment. If it was sanctioned by the meeting the Directors would advise a further adjournment, in consequence of the reception from the colony within two days of despatches which they have not yet prepared to lay before the meeting, as they had not had sufficient time to make a perspicuous digest of them. All he could say at present was that a portion of these despatches were very satisfactory, and another not quite so much so as regarded the affairs of the colony. It was then resolved, "That the meeting should be further adjourned to Friday, the 28th inst."

Sale of Mr. B. H. Bright's Manuscripts.—This valuable collection was sold on Tuesday at Sotherby's Rooms, and, almost without exception, the lots brought enormous prices. Independently of others, there were two grand prizes—the "Illuminated Psalter" and the "York Miracle-plays." The first sold for 225*l.*, and the last for 305*l.* The Psalter was very beautiful as a work of art of an early period; but the collection of Miracle-plays was most precious as a literary curiosity; it is a complete series of dramatised stories from the Old and New Testaments. The British Museum bid 300*l.* for it, but would not exceed that sum. It secured, however, a lot called "Treasury," for 30*l.*, which consists of copies of all the Privy Seals, &c., issued between October 1611 and the same month in 1614, and which originally came from Sir Julius Cæsar's collection. The Museum also purchased an original MS. of Sir P. Sydney's "Astrophel and Stella," partly in the hand-writing of the author, his sister, and Samuel Daniel, the poet, together with some other articles of great interest. The MS. of Chaucer's "Canterbury Tales" was bought by Lord Ashburnham for 70*l.*, and it was understood in the room that Sir T. Phillips was a buyer to a considerable amount.

Walbrook Church.—Such is the dilapidated state of the church of St. Stephen, Walbrook, the master-piece of Sir C. Wren, that the large front window fell into the street, frame and all, last week. Fortunately no person was passing at the time. The circumstance has naturally caused a sensation in the parish. The parish surveyor has reported that the church is in extreme danger, and it will of course remain closed for the present.

Greenwich Park.—During the past week Greenwich and the neighbourhood of Blackheath have been the scene of great excitement, in consequence of the erection of a reservoir in the park being commenced by order of the Commissioners of Woods and Forests, for the purpose of suppressing any fire which may break out in Deptford Dockyard, or at the Hospital. It is to be oval-shaped, eighty yards wide, twelve feet deep, and surrounded by a mound twenty feet wide at the base, and six feet high, to be formed of the shingle dug out from the foundation. The spot selected is on the high ground near Croom's-hill, the finest part of the park. Another source of annoyance to the inhabitants is the building two villas on the other side of the park, near Croom's-hill, for two Commissioners of the Hospital. On Friday night a crowded meeting of the inhabitants took place, which was presided over by the rector, the Rev. W. F. Soames, for the purpose of taking into consideration the best means to prevent the encroachments upon the park. The meeting was addressed by Mr. Angerstein, late M.P. for the borough, and several other gentlemen. The rector stated that in addition to the objections mentioned above, there were in the upper part of the park several valuable and ancient barrows; indeed, so valuable were they considered, that an attempt had been made to shield them from destruction by the members of the Archaiological Society, who had stepped forward to preserve the barrows, admitted to be upwards of 1000 years old, all of which would be swept away by the construction of the reservoir. Resolutions expressive of their determination to resist the encroachments were carried, and it was agreed, without a dissentient voice, that a petition should be prepared and presented to Parliament forthwith, to stay the encroachments. This petition was presented on Monday by Mr. Hawes, and in reply to his questions on the subject, the Earl of Lincoln said he had great pleasure in assuring him that the anxiety of the petitioners was not justified by any application to or conduct of the Commissioners of Woods and Forests. There was no intention on the part of the Commissioners to build houses within the park. The fact was, that there was a strip of land adjoining the park which belonged to Greenwich Hospital, and some arrangements respecting increased accommodation for the establishment in Greenwich being in contemplation, the authorities sought to exchange that piece of land for an equivalent slip within the park, to be used for a garden. He had, however, informed the authorities that their plan was objectionable, and it had been taken back for revision. It had never been in contemplation to erect buildings in the park, and there was no foundation for the report.

East India Company.—The Quarterly General Court of this Company was held on Wednesday. The business was chiefly of a routine character, the motions on the support of Juggernaut, on the question of appeals from India, on the loan in Scinde, and on the employment of natives in situations of trust being all withdrawn. Before the Court adjourned, several proprietors expressed their approbation of the Directors in recalling Lord Ellenborough, and their continued confidence in their management of the Company's affairs.

Anti-Corn-Law League.—The meeting of the League took place on Wednesday, in Covent Garden Theatre, and possessed more than usual interest, in consequence of the recent decision on the sugar duties, the difference which took place on that question amongst the free-trade members, and the circumstance that Sir Robert Peel's proposition and retention of office were carried by the more immediate votes of the League members. Mr. G. Wilson, the Chairman of the League, presided. Mr. Cobden first addressed the meeting, and said that he and the other ten members who supported him, voted with Government on the ground of free trade, whereas the Liberal party generally voted on party grounds, for the purpose of turning out Sir R. Peel. The meeting was then addressed by the Rev. Mr. Spencer, of Somersetshire, and Mr. W. J. Fox. The chairman said that as next week Mr. Villiers's motion would come on, the League would not meet till that night fortnight.

The Statue of Lord Byron.—The statement of the *Morning Chronicle*, which was noticed in this paper a fortnight since, relative to the disappearance of Thorwaldsen's statue of Byron, is contradicted. It appears that it never was in the warehouses belonging to the Custom House, but in the warehouses of the London Docks, and that the customs' duties were regularly paid on the first arrival of the statue by Thorwaldsen himself, who intended to present the statue to Westminster Abbey. In consequence of the report alluded to, the Board of Customs have instituted an inquiry into the affair, and the result has been the discovery of the statue in the London Docks, in a state of perfect preservation, the case never having been disturbed since it first came over. The most curious part of the story is the statement, that the executors were not aware that the statue was ever placed in the London Docks.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending June 15.—West Districts, 131; Northern, 168; Central, 150; Eastern, 174; Southern, 282; Total, 855. Weekly average for the last five years, 946.

Provincial News.

Birmingham.—On Monday a meeting of the inhabitants of this town was held, the mayor presiding, for the purpose of addressing the Crown and adopting other measures, in consequence of the imprisonment of Mr. O'Connell. Mr. Joseph Sturge moved the adoption of a protest in the form of a series of resolutions, which was agreed to; and a memorial to the Queen, founded upon the protest, was unanimously carried. Another resolution was adopted, approving of the suggestion to set on foot a subscription to pay the fines of Mr. O'Connell and his colleagues. Similar meetings have been held at Leicester, Edinburgh, and other places.

Bristol.—A curious dispute has arisen between the Peninsular Company and the Great Western Steam Company. The former, it appears, purchased the steam ship Great Western for 32,000*l.*, the owners undertaking to do whatever the Admiralty surveyors might deem necessary to qualify the vessel for the mail service. Some delay having taken place, the owners considered the contract at an end, and took on themselves to withhold the vessel, thus virtually cancelling the contract, and, without notice to the Peninsular Company, advertised her departure for New York. The Peninsular Company feeling that the delay was not to be laid to their account, but to that of the Admiralty, and not disposed to yield to this summary extinguishment of what was considered a desirable purchase, an application was made to the Court of Chancery to prohibit the vessel being sent to sea, and immediately granted. The other Company, however, have since obtained a dissolution of the injunction, and the Great Western is to sail for New York, as originally announced.

Chelmsford.—At a meeting of the Essex Agricultural Society, held on Monday, in this town, the Rev. J. Cox in the chair, resolutions were agreed to condemnatory of some of the details of Sir R. Peel's Bank Charter Bill, and a petition to Parliament, founded upon them, was adopted by the meeting, with only two hands held up against it.

Durham.—A meeting was held in this city on Friday for the purpose of promoting the erection of a monument to the late Earl of Durham. The monument will be erected on Pensher-hill, and will be seen from the Great Northern Railway, and from a large portion of the surrounding country, as it will be upwards of 70 feet in height. It will consist of a rectangular base of solid masonry, 97 feet long, and 54 wide, rising 10 ft. above the platform of the hill, being surmounted by 18 lofty, open, equidistant columns, supporting at each end a pediment, and on each side a broad deep entablature, which will serve as a promenade. It is expected that the monument will be commenced forthwith, sufficient subscriptions to cover expenses having been received.

Eton.—On Thursday, His Royal Highness Prince Albert laid the foundation-stone of the new buildings at Eton College. The Prince arrived from town about half-past 12, and was received with all the honours by the College authorities. After Divine Service in the chapel, the Prince performed the ceremony of laying the foundation-stone, after which the Captain of the School delivered a Latin oration. The Bishop of Lincoln then delivered the benediction, and the numerous assemblage retired. Three galleries, one of which was crowded with ladies, were erected for the accommodation of the numerous friends of the authorities of the College and visitors, to the number of between 2000 and 3000.

Gravesend.—A Mr. Jury, the owner of several houses in this town, has been committed for trial on the charge of having wilfully murdered a woman named Elizabeth Hartnell, aged 37, with whom he lived. The woman was found severely wounded, and the prisoner said it was caused by an upset of his gig. It was proved, however, that he had inflicted the wounds on her head with a pewter pot, both parties being intoxicated.

Guernsey.—The local papers state that Ministers have declared their desire of having the complaints brought by the Court and the inhabitants against the Lieutenant-Governor heard by the Privy Council with the least possible delay, and that the first hearing will take place before the end of this month.

Huntingdon.—A severe shock of earthquake was felt at Yaxley in this county on Wednesday evening, the 12th inst., more particularly on the hill, appearing like a park of artillery passing under the houses, shaking them to the foundation. Scarcely a shower of rain has fallen since the 26th March.

Manchester.—On Friday last, the immense tract of bog land called Chat Moss, over which the Manchester and Liverpool railway runs, was discovered to be on fire in two places. This moss has, within the last few years, been put under cultivation very extensively, and many prosperous farms have been established upon it. In consequence of the long continuance of dry weather, the vegetation has become very inflammable. The conflagration is supposed to have been caused either by the farmers on the border burning off the moss and heather, to render the land more susceptible of improvement, or by spontaneous combustion. The fire extended over a distance of at least three miles, and the smell of burning peat was perceptible in Manchester, the strong westerly winds causing it to drive in that vicinity. Numbers of persons were engaged in attempting to stop the progress of the fire by digging trenches in the neighbourhood of Worsley, the seat of Lord F. Egerton, whose fine plantations escaped with slight injury.

Newcastle-upon-Tyne.—An inquiry under a writ of extent issued out of the Court of Exchequer, has been instituted here to ascertain what property, goods, chattels, deeds, bonds, or specialties, belonged to the late Mr. Edward Hall Campbell, formerly an extensive distiller in Newcastle, carrying on business under the title of Campbell and Co., and against whom a verdict for upwards of 15,000*l.* for duties payable to the Crown was obtained a few days ago in a suit promoted by the Commissioners of Excise. It appears to have been the practice of the firm to send out to their wholesale customers in various parts of the kingdom several times the quantity of spirits mentioned in the permit, and the fraud was discovered through the information of a discarded servant named Henley, who in fact was the chief instrument of the firm in carrying on their irregular operations. Under a writ of inquiry directed to the High Sheriff of Northumberland, a jury sat at the Moot-hall on Friday, and investigated numerous claims upon the estate made by the Crown and others having mortgages on the property. The verdicts were generally for the Crown; but on the stock and materials of the distillery the jury found for the widow, considering it proved in evidence that she had *bonâ fide* purchased the property of her son, who was one of the partners in the firm.

Oxford.—The "Commemoration" commenced on Tuesday with the usual concerts in the University Theatre. Sir R. Bishop was the Conductor, and the principal vocalists in London were engaged for the occasion. On Wednesday the miscellaneous concert was performed before a crowded audience. On Thursday the Vice-Chancellor opened the Convocation in a Latin speech, in which he named the 13 persons whom it was intended to present for the honorary degree of Doctor of Civil Law. They were the Earl of Powis, Sir W. C. Medlycott, Sir James Ross, General Pasley, Sir J. W. Awdrey, Mr. G. Bowyer, Mr. D. Maclean, M.P., Mr. Entwisle, M.P., Mr. Sergeant Talfourd, Mr. Airy, Astronomer Royal; Mr. Baily, the astronomer; Professor Struve, astronomer to the Emperor of Prussia; and Mr. Cockerell, the architect. They were severally presented o Convocation by Dr. Phillimore, Regius Professor of Civil Law, whose Latin speeches were at once brief, and to the purpose. Lord Powis's recent defeat of ministers on the Welsh bishopric was alluded to with praise; reference was made to Sir W. Medlycott's military services; to the adventures and scientific pursuits of Sir James Ross, the arctic and antarctic voyager; and General Pasley. A high eulogy was passed upon the forensic character and eloquence of Sergeant Talfourd, and his successful cultivation of letters was happily alluded to. The rest were merely introduced without preface or praise. The Vice-Chancellor took the "placets" and the "non placets" of the members of convocation; and, in each instance, not one "non placet" was spoken. The Crewian orations and the prize poems were then recited, after which the Convocation was dissolved. There was less expression of opinion on the part of the undergraduates than there was last year, in consequence of a public caution from the Vice Chancellor on the subject. The concert th n took place, with which the business of the commemoration terminated.

Wakefield.—The poor woman (the second) alluded to in our last as being in a dangerous state from the attack of the bear which escaped from its pit in the Zoological Gardens, died on Sunday morning.

Windsor.—The Royal Maestricht Gardens, which are nearly half a mile in length, and situated at the north-western extremity of the Little Park, are on the eve of being dismantled, as there is now no farther occasion for them, in consequence of the new Royal Gardens at Frogmore, extending over upwards of 20 acres, having been brought into a full state of cultivation by her Majesty's gardener, Mr. Ingram. Instructions have just been received from the Commissioners of Woods and Forests, for the whole of the sheds, fruit houses, the extensive greenhouses, &c., to be pulled down and disposed of by auction, preparatory to the ground being cleared and thrown into the Home Park.—On the morning of the 18th inst., the tri-coloured banner, by which the Duke of Wellington holds Strathfieldsaye, was duly presented at the castle and placed in the guard chamber over Chantrey's bust of his Grace. This is the 29th banner received since the battle of Waterloo.

Worsley.—On Saturday, the 15th inst., George Egerton, Esq., eldest son of Lord Francis Egerton, M.P. for South Lancashire, and the proprietor of very large estates and extensive works in this part of the country, attained his majority. Thousands of people flocked from all the towns within ten or twelve miles. Accommodation to dine was provided for upwards of 3000 persons in a large tent erected for the purpose, and boats were supplied by his lordship to bring his workpeople from Manchester and other places on the line of canal. About ten o'clock crowds of persons in procession, and headed by bands of music, entered the village, and continued to flow in until two p.m., when there could not be fewer than 10,000 persons in the park. Numerous old English games and sports took place during the day, and prizes were given to the most successful competitors. They consisted of quoiting, hentch and kick, putting the stone, jumping, wrestling, foot-racing, donkey and hurdle-racing, steeple chase, sack races, dancing, &c. Lord F. Egerton also determined to mark the day by building a church for the benefit of the villagers. The foundation stone was laid by his son, and after the ceremony the company retired to the pavilion, where dinner was provided. About 3000 persons sat down to dinner, which consisted of roast beef and plum pudding. Upwards of 4000 lbs. of meat had been cooked, and 17 cwt. of plum pudding. There were 1500 gallons of ale, 54 gallons of ginger beer, 36 gallons of lemonade, &c. About two o'clock the doors were thrown open, and the workmen entered in procession, each man taking his seat under the direction of stewards, until the room was completely filled. James Loch, Esq., M.P., presided, and was supported by Lord and Lady F. Egerton, and numerous members of their family. Nothing could surpass the enthusiasm of the meeting. Mr. Egerton, in acknowledging the toast of his health, expressed his hope that those who were that day assembled to do him the honour of celebrating his majority would never have cause to complain that the duties which he may be called upon to fulfil were neglected, or their interests unattended to. Lord F. Egerton also addressed his guests, and said it was not the first time he had met his workmen in rejoicings; they had also met on occasions of great danger, which he hoped would never return; but the occasion which brought them together that day was of good old English practice, which he loved to see continued, and one which he believed the Duke of Bridgewater himself would have rejoiced to be present at. He was sure such a spectacle as the one now before him would not fail to impress upon the mind of his son how important it was for him to court the regard and friendship of those who were so willing to receive it as those around him were. Without the regard of the poor, the elements of worldly prosperity might accumulate upon his head, but he (Lord F. Egerton) would now tell him, that without it riches and wealth and power would never be lasting. About six o'clock upwards of 2000 of the workmen's wives and daughters took tea together, and the night was afterwards spent in games and the discharge of fireworks.—We may here mention that it is rumoured at Manchester that Lord Francis Egerton will almost immediately be created Duke of Bridgewater; and that, in the event of his accession to the Peerage, his Lordship's eldest son will be a candidate for the representation of South Lancashire.

Woodford.—About midnight on Wednesday night, the extensive stables and other out-buildings of the White Hart Inn, in this village, belonging to Mr. Stokes, were destroyed by fire. Three cottages adjoining were also burnt, and the damage would have been more extensive, if some buildings in the line of fire had not been pulled down to cut off the communication. The buildings were not insured.

Railways.—The following are the returns for the past week:—Birmingham and Derby, 1384*l.*; Birmingham and Gloucester, 2404*l.*; Eastern Counties, 4581*l.*; Edinburgh and Glasgow, 2195*l.*; Great Western, 21,414*l.*; Grand Junction, 8550*l.*; Glasgow, Paisley, and Ayr, 1405*l.*; Great North of England, 1367*l.*; London and Birmingham, 18,090*l.*; South-Western, 7388*l.*; Blackwall, 1400*l.*; Greenwich, 1019*l.*; Brighton, 3814*l.*; Croydon, 483*l.*; Liverpool and Manchester, 5513*l.*; Manchester, Leeds, and Hull, associated, 6816*l.*; Midland Counties, 2936*l.*; Manchester and Birmingham, 3286*l.*; North Midland, 4596*l.*; Newcastle and Carlisle, 1604*l.*; South-Eastern and Dover, 4145*l.*; Sheffield and Manchester, 656*l.*; York and North Midland, 1761*l.*—The shareholders of the Norwich and Brandon Railway at their recent meeting adopted the suggestion of the directors to have a double line at once, which will require an additional sum of 80,000*l.*, to be raised on mortgage, without increasing the capital of the company. It was stated in the report that the works have already commenced, and are proceeding so rapidly that the line will probably be opened to the public in the course of next summer.—The Dundee and Arbroath Company held their meeting last week, when the directors recommended a dividend of 5 per cent. on the capital stock of the company, payable on the 1st of July next, which would absorb 5000*l.* of the net profits of the year, leaving 354*l.* to be carried to the reserved fund, now amounting to 3602*l.* The interest payable on the debt of the company has been reduced to 3½ per cent.—The Newcastle and Darlington Junction Railway, being a continuation of the line of the Great North of England from Darlington to Newcastle, was opened on Tuesday with the usual formalities. A special train left Euston-square station at 3 minutes past 5, A.M. and reached Newcastle at 35 minutes after 2, thus completing the distance of 303 miles in 9 hours and 32 min., a feat unparalleled in the annals of railway travelling in this kingdom. The way in which each of the companies performed this task was as follows:—London to Birmingham, 83 miles, in 2 h. 11 min.; Midland Counties, 49 miles to Derby, 1 h. 22 min.; North Midland, 63 miles to Normanton, 1 h. 28 min.; York and North Midland, 24 miles to York, 37 min.; Great North of England, 45 miles to Darlington, 1 h. 13 min.; the new line to Newcastle, 1 h. 20 m. A special train also left York at 10 o'clock, with Mr. Hudson and a party of friends, and at Darlington this train was joined by a long one from Newcastle, which left that place at 9. The procession train thus formed consisted of 39 first-class carriages, drawn by three engines. On reaching the new station at Gateshead, addresses were presented to the Chairman of the Directors by the Mayor and Corporation of that town; and the party immediately after proceeded to Newcastle, where an entertainment was provided. About three hundred sat down to dinner, amongst whom were the Chairman, and several Members of Parliament, who voted in the division on Tuesday morning, breakfasted in London, and were in Newcastle in time for an early dinner the same day.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association took place on Monday, Mr. Geary, Mayor of Limerick, in the chair. Mr. W. S. O'Brien, M.P., commenced the proceedings, by reading a letter from the Roman Catholic Bishop of Killaloe, inclosing 120*l.*, subscribed by the clergy of that diocese. He also read a letter from Mr. Morgan John O'Connell, M.P., inclosing a subscription of 5*l.* to the funds of the Association, and signifying, for the first time, the adhesion of the writer to the repeal cause. He also announced the receipt of 20*l.* from Mr. J. Gully, late M.P. for Pontefract, as his subscription to the funds of the Association. A vast number of communications were read by the Secretary and others, inclosing sums of money from various parts of the kingdom towards the funds of the Association. The following are a few of the items:—Drogheda, 110*l.*; Limerick, 66*l.*; Charleville, 41*l.*; Liverpool, 137*l.*; Cork, 216*l.*; from the members of Mr. O'Connell's family, 42*l.*; from Ulster, 104*l.*; Abbeyleix, 45*l.*; Ballinasloe, 53*l.*; from the wards and trades of the city of Dublin, 320*l.*; Tralee, 50*l.*; Waterford, 253*l.*; Ballina, 60*l.*; Londonderry, 49*l.*, &c. Mr. S. O'Brien rose, to submit t› the meeting an address to the Queen on the subject of the imprisonment of the conspirators. Before reading the document, he would make his weekly report about Mr. O'Connell; and he was happy to be able to state that he saw him the preceding evening in excellent health and spirits. It was true, that since their last meeting an additional restriction had been placed on his enjoyment, by prohibiting him from receiving those testimonies of respect and affection with which he was greeted by every portion of the island. They felt regret even more deeply than O'Connell himself, that he was prevented from holding communion with his fellow-countrymen, and that they were thereby denied the privilege of testifying personally the universal sentiment of the country. This was another item in the long catalogue of affronts which they were daily receiving from England, but, like those which preceded it, this aggression on their rights brought its reaction against those who were guilty of it. He wished to ascertain from whom this restriction had originated, and he wrote to Sir J. Graham on the subject, and found that the English Secretary gave his sanction to that measure, and he trusted the Irish people would not forget it. It was true that the representatives of the

various corporate bodies of the country had been denied admission to Mr. O'Connell, but they subsequently met and laid before the country a declaration which would be for ever memorable in their annals, recording their indignant protest against the policy by which the Government of this country was guided, and against the treatment which one of the most illustrious of her sons had experienced, and, above all, signifying, on the part of the municipalities with which they were connected, that they would never be satisfied with less than domestic legislation. When he witnessed that scene he felt that the real governor of Ireland was in Richmond Bridewell. He ridiculed the order for excluding Repeal buttons from the Castle and the Barrack, and the administration generally of Lord de Grey, who, he said, had been lately observed drilling the Police in the Park, and teaching them to shoot Repealers after the most approved fashion of the Yorkshire yeomanry. Mr. O'Brien next spoke of her Majesty, and the kindly sentiments which she was known to entertain towards this country, but now she was not permitted to express them. He referred to the Emperor of Russia, whom he called the "monster Nicholas," who, he said, was a new firebrand let in to vex this country. Did they want to make a Poland of Ireland? After some further observations, he commenced reading the address to the Queen. He then alluded to the rumoured resignation of Ministers, and promised the assembly that no compromise should be made with the Whigs on the subject of Repeal, and that if they looked for Irish support, they must be prepared to concede that measure. The address was unanimously adopted, after which, Mr. M'Nevin, barrister, moved the suspension of the standing orders, for the purpose of passing a resolution condemnatory of an article in the *Limerick Reporter*, which exhorted Repealers to arm themselves, and show a passive resistance to the payment of rents. The younger Mr. O'Connell seconded the resolution, and strongly reprobated the dangerous excitement of the Limerick journalist. The rent for the week amounted to the large sum of 3389*l.*

Theatricals.

ITALIAN OPERA.—"*Don Carlos*," the new opera by Signor Costa, was performed for the first time on Thursday night, with complete success. It is a work which entitles its author to a high place among the dramatic composers of the modern Italian school. He has been fortunate in the subject and its dramatic treatment, the piece having been written by Signor Leopoldo Tarantini, a distinguished poet, who has produced a lyrical tragedy of much beauty and interest. The performance was excellent in every respect, and at the close of the piece S. Costa and Grisi were called for and welcomed with acclamations. Her Majesty and Prince Albert were present, and altogether it was a gratifying night to the composer, whose success in a most difficult undertaking was complete.

HAYMARKET THEATRE.—*The Prize Comedy.*—The long-anticipated prize comedy, by Mrs. Gore, "*Quid pro Quo, or the Day of Dupes*," which the judges selected from upwards of 100 competitors, to receive the reward of 500*l.* promised by Mr. Webster, was brought forward on Tuesday night. The anxiety to be present produced a rush to all parts of the house, which was completely crowded, before the curtain drew up, with a highly excited audience. Boxes, pit, and gallery were on the *qui vive*, and manifested much impatience at a short delay which took place before the orchestra commenced the introductory performance. When Mr. Webster came forward to speak the prologue, he was greeted with the most hearty cheers, which were repeated again and again before he concluded; and when the curtain drew up, it was evident that great pains had been taken to put the play on the stage in the most effective manner; but almost before a word was uttered some low hissing sounds from different parts of the theatre indicated the presence of a hostile party determined if possible to damn it. This party, from time to time, continued to show themselves, and often created an uproar, as the great majority of the audience were indignant at such unfairness, and sounds of "Disappointed authors!" "Turn them out!" mingled with applause and hissing, frequently interrupted the progress of the play. The characters in the comedy are the *Earl of Hunsdon*, a retired minister, (Mr. Stuart), whose whole soul is set upon politics and place; his wife (Mrs. Clifford), a heartless lady of high life; his son, an Etonian, (Mrs. Nisbett), abounding in impudence and slang; a retired citizen (Mr. Strickland), panting after the aristocracy, and eager to imitate the Hunsdons; the citizen's wife (Mrs. Glover), a vulgar, good-hearted woman, entirely opposed to the aristocratic tendencies of her husband; their servant *Bridget* (Mrs. Humby), priding herself upon her notions of decorum; a tuft-hunting captain (Mr. Buckstone), who acts as toady to the *Countess*; and a relative of the noble family, a judicious old gentleman (Mr. Farren), who says sharp things. These are the characters of the piece, though there are other personages who work out the plot, if that may be called a plot which had nothing to do with the success or failure of the piece. The play, indeed, was rather a succession of gay lively scenes, exhibiting several varieties of modern character, and abounding in smart allusions to the foibles of the day, than such a *comedy* as was expected. The title of the "*Day of Dupes*" arises from several small stratagems which are played off by the *dramatis personæ* against each other. A lieutenant in the navy takes in the Hunsdons by pretending to be a nobleman, and the earl is deceived by his agent, who gets a borough out of his hands. It will be seen, from the foregoing outline of the comedy, that its claim to dramatic excellence consists in the multiplicity of its characters, and in placing them in perplexing situations. As an exhibition of English manners, which was one of the objects proposed to be accomplished, it is an utter failure, for not one of the characters presented can be recognised in any rank of society. The only moral inculcated is the injurious tendency of private theatricals, and even this is managed so completely in burlesque as to miss its aim. In dramatic interest "*Quid pro Quo*" is altogether wanting, and the confused manner in which it terminates exhibits want of skill in the playwright. Its claim to merit is some smartness occasionally in the dialogue, and a few pointed allusions to passing events. The audience were for a long time very enduring, and succeeded in putting down the attempts of the hostile party before noticed, but towards the end of the third act, when the plot was becoming more perplexed, without any increase of interest, and even the dialogue began to flag, the malcontents became more powerful. In the last scene many of those who had been staunch supporters throughout relaxed in their efforts, and some allusion to repetition was met with a storm of "Noes" that could not be suppressed. After this tempest had somewhat subsided, Mrs. Nisbett came on to deliver the epilogue, but the uproar was renewed with so much vehemence that she retreated. Mr. Webster then came forward, and after having for a long time vainly attempted to procure a hearing, he spoke to the following effect:—"Ladies and Gentlemen—This play has cost a large sum—(Uproar)—and a large sum has been expended on its production. The comedy was not selected by me; it was chosen by a committee of gentlemen of the highest literary talent. (No, no!) All I have to request is that you will hear it to the end; then your award will be attended to." This speech was received with cheers, and Mr. Webster, after retiring, shortly returned, leading on Mrs. Nisbett, when the epilogue, in which Mrs. Humby took part, was listened to without producing any effect, and was followed by another storm. The piece may be played for a few nights more, but if any judgment is to be formed of the temper of an audience, the failure is unquestionable. Though the hissers were resisted by applauders, the latter did not attempt to call for the actors, or exhibit any of the usual signs of enthusiasm in its most conventional form. Such has been the termination of the long-expected play, which has been such a costly affair to the manager. He did his best to give it every advantage which good scenery and good acting could afford, but the play was so feeble, that no acting and no stage appointments could render it popular. We subjoin the names of the judges who made the selection from upwards of one hundred other comedies:—Charles M. Young, Esq.; E. R. Moran, Esq.; Henry Ottley, Esq.; J. Clarke Searle, Esq.; the Rev. Alexander Dyce; G. P. R. James, Esq.; Charles Kemble, Esq., (chairman).

Miscellaneous.

Analysis of Division on Mr. Miles's Motion.—Friday.—Majority for it 20.

FOR—TELLERS INCLUDED.		AGAINST—TELLERS INCLUDED.	
Liberals	182	Liberals	15
Tories	61	Tories	203
	243		223

Monday, June 17.—Majority against it, 23.*

Liberals	196—14 more than on Friday.	Liberals	11—4 less than on Friday.
Tories	39—22 less than on Friday.	Tories	246—38 more than on Friday.
	235		257

The following 48 Members who had not voted with the Ministry on the division of Friday, assisted Sir R. Peel on Monday in reversing the previous decision of the House. Those four, whose names are printed in Capitals, voted on the previous occasion with Mr. Miles:—

Ackers, J.	Hardy, J.	Masterman, J.
Acland, T. D.	Hawkes, T.	Maxwell, J. P.
Acton, Colonel	Hepburn, Sir T. B.	Mildmay, H. St. J.
Antrobus, E.	Hotham, Lord	Newry, Viscount
BAGGE, W.	Houldsworth, T.	Paget, Lord W.
Beresford, Major	Irton, S.	Palmer, G.
Buckley, E.	Jolliffe, Sir W. G.	Powell, Colonel
Bunbury, T.	Kemble, H.	Price, R.
Burrell, Sir C. M.	Knight, F. W.	Ryder, G. D.
Charteris, F.	Law, C. E.	Sheppard, T.
DOUGLAS, Sir H.	Lawson, A.	Smollett, A.
Eaton, R. J.	Legh, G. C.	Thompson, Ald.
Emlyn, Viscount	Lopes, Sir R.	TURNOR, C.
Fitzroy, H.	Lyall, G.	Vivian, J. E.
GORING, C.	Mackinnon, W. A.	Wellesley, Lord C.
Grogan, E.	Marsham, Viscount	Wyndham, Colonel

The following 15 Members, who supported the Ministry on Friday, did not aid on Monday in negativing a deliberate decision of the House:—

Blandford, Marquess	Estcourt, T. G. B.	Mitchell, T. A.
Bright, J.	Greenall, P.	Morgan, C.
Cochrane, A.	Heathcoat, J.	Pollington, Viscount
Cresswell, B.	Hillsborough, Earl	Pringle, A.
Drax, J. S. W.	James, Sir W. C.	Rolleston, Colonel

The following 37 Members, who formed part of Mr. Miles's majority, withheld their aid on the subsequent division, four of the number passing over to the opposite ranks:—

BAGGE, W.	GORING, C.	Phillpotts, J.
Blewitt, R. J.	Henley, J. W.	Pulsford, R.
Bodkin, W. H.	Howard, Sir R.	Rashleigh, W.
Buller, C.	Lascelles, W. J.	Repton, G. W. J.
Christopher, R. A.	Mangles, R. D.	Rumbold, C. E.
Clements, Visc.	Marjoribanks, S.	Shirley, E. P.
Copeland, Ald.	Metcalfe, H.	Smith, A.
Dashwood, G. H.	Muntz, G. F.	Taylor, E.
Dick, Q.	O'Brien, A. S.	Trollope, Sir J.
DOUGLAS, Sir H.	Ossulston, Lord	TURNOR, C.
Entwistle, W.	Paget, Lord A.	Waddington, H. S.
Fielden, W.	Pennant, Colonel	Wall, C. B.
Gisborne, T.		

The following 29 Members, who did not vote on the former occasion, came forward on Monday to oppose the reversal of the previous decision:—

Ainsworth, P.	Hall, Sir B.	Pattison, J.
Berkeley, G. F.	Heathcote, G. J.	Pigot, D.
Blake, M.	Hoskins, K.	Ponsonby, C. F. A.
Browne, R. D.	Leader, J. T.	Ramsbottom, J.
Childers, J. W.	Leveson, Lord	Rice, E. R.
Clay, Sir W.	Macaulay, T. B.	Smith, B.
Currie, R.	Matheson, J.	Somers, J. P.
D'Israeli, B.	Morison, General	Stock, Sergeant
Ellice, E.	Murphy, F. S.	Turner, E.
Fitzwilliam G.	Murray, A.	

Had the following 11 Members, who have on other occasions voted for a diminution of duties, and who have been considered supporters of free trade, voted with Mr. Miles on Monday, the Ministry would have been again left in a minority:—

Bouverie, E. P.	Gibson, M.	Ricardo, J. L.
Cobden, R.	Hayter, W. G.	Thornley, T.
Ellice, W.	Humphrey, Ald.	Warburton, H.
Forster, M.	Marsland, H.	

* In the official List of the Division, the name of Mr. James is erroneously printed among the supporters of Government, whereas he really voted for Mr. Miles's motion. Deducting, therefore, Mr. James's name from the Ministerial "noes," and adding Mr. G. Smythe's name—which was omitted from the list—to the ayes, the actual majority obtained by Government on Monday was 20, instead of 22, as the authorised list stated. But for the seven free traders, who voted with the Minister, he would have been in a minority of 4.

Colonel Stoddart and Captain Conolly.—Captain Grover has received letters from Dr. Wolff, dated Meshed, from the 14th to the 21th of March. At Askarea, two miles from Meshed, Dr. Wolff was met by Mullah Meshiakh, the Jew of Meshed who assisted him in 1831, when he escaped from slavery at Torbad. He was accompanied by Mohammed Ali Seraf, Colonel Stoddart's agent. They had heard of his approach by the caravans. This Mohammed Ali Seraf was the man through whose hands passed all the letters, and the doctor says—"In less than two hours I found this man to be a lying, treacherous scoundrel!" Numerous proofs are given of his villany, and it is shown that he alone, and not Colonel Sheil, is to blame for the detention of the Sultan's letter. The Doctor discovered that this man had property in his possession belonging to Colonel Stoddart of the value of 2000*l.* sterling. Sir Moses Montefiore had kindly written letters to the Jews of Bokhara, Samarcand, Balk, and Kokan, which were to have been sent through a highly respectable Jew of Meshed, named Mullah Medee; but Colonel Sheil, of course, according to Colonel Stoddart's direction, sent them to this Mohammed Ali Seraf. Dr. Wolff inquired about these letters, and found the most important one, that addressed to the Jews in Bokhara, still in his possession, with the seal broken. Dr. Wolff took this letter, and, as it was no longer of use, he has returned it to Sir M. Montefiore, through Colonel Sheil. In a subsequent letter Dr. Wolff mentions that Aga Abool Kasem, a respectable merchant, formerly British Agent, informed him that Colonel Stoddart had sent to Mohammed Ali Seraf shawls to the value of 1000*l.* sterling, for the purpose of raising money to pay for some land. The Doctor says—"I asked him about that. He replied, that he had still the shawls in his possession, and that he intends to deliver them to Colonel Stoddart's sister in person! You see by this that the fellow is a rogue." Dr. Wolff was to be escorted by 270 Turcoman chiefs to Bokhara. He gives an interesting account of their having been assembled in a tent by the Viceroy, who showed them the letters of the Sultan, the King of Persia, the English and Russian Envoys, and thus addressed them:—"Here I recommend to you an English Mullah, recommended to the Kings of Bokhara and Khiva by four Sovereign Powers!" They stroked their beards, and swore to convey him in safety to Bokhara. Another chief of a caravan, named Kurban, who goes to Bokhara every three months, states, that Stoddart and Conolly are alive, and imprisoned in the Kalai, outside Bokhara; and the Doctor says, "Kukulli, a Turcoman chief, showed me a letter from his brother at Bokhara, in which he states that Stoddart is alive to a certainty, and his Excellency the Assoof Adowla (Viceroy) of Khorassan, to whom I sent the King's courier to inquire where I should go to meet him, at Madaan or Meshed, sent me word that Stoddart and Conolly were alive last year." Dr. Wolff states that the Saleh Mohammed who communicated to Colonel Sheil the report of the death of Stoddart and Conolly is not the Saleh Mohammed whom he knew in the year 1826. He also mentions that an Ambassador from Russia had just arrived at Bokhara.

Sub-marine Battery.—The American papers contain interesting accounts of a series of experiments with a new sub-marine battery invented by Mr. Colt. The experiments took place at Washington. The bank of the river, for a long distance, was lined with spectators who had assembled to the number of ten thousand, exclusive of those in the steamers and the small sailing craft which lay in the river to witness the experiment. The President was on board one of the steamers, in honour of whom a salute was fired from the navy-yard on the arrival of the steam-boat near the place where the experiment was to be made. At five o'clock the ship was put in sailing condition, her sails squared to the wind, and at a given signal from her commander, the cables were slipped and the vessel started on her course. The captain and crew remained on board until within about fifty yards of the spot where the batteries were placed. About the time of her starting a beautiful *jet-d'eau* was thrown up at some distance from the vessel, the water ascended more than a hundred feet, as a signal from Mr. Colt that all things were then ready. The first battery in the range of those intended for the destruction of the ship exploded a short distance from her larboard bow; the

second was much nearer, and the third took effect immediately under her foremast, throwing the bow of the ship some ten feet out of water, and shattering the whole vessel forward of the mainmast into atoms—the remaining portion sunk in one minute to the bottom, leaving the stern in part out of the water. The exhibition concluded with the sending up of a signal rocket, and a second *jet-d'eau*, which must have thrown the water 150 feet into the air.

Rats in the Hebrides.—Generations have passed away without seeing a rat on the small island of Tarinsay on the west coast of Harris. An innumerable swarm of these annoying and destructive vermin has of late spread over the island, notwithstanding the efforts made by Mr. Macdonald, the tacksman, to extirpate them. They appear to be increasing so fast that they threaten to overrun the whole island, and keep violent possession of it. They are supposed to have come from the island of Soay, which lies at the distance of about three miles from Tarinsay, and into which the Earl of Dunmore, some years ago, ordered rabbits to be sent. Soon after this, the rats, which were formerly very numerous in the island of Soay, completely disappeared, having removed in a body to the neighbouring island of Tarinsay, from which they are not inclined to make their departure in a hurry.—*Scotsman.*

Romance of Real Life.—The deaths of the Count and Countess de Noailles, which has lately taken place in France, were preceded by extraordinary and interesting circumstances. They were cousins, and both previous to their marriage bore the same name. Being brought up together, they became attached to each other from their infancy, but as the constitution of each was so feeble as to indicate premature death, their parents long opposed their union. At last, however, from their own earnest entreaties, their marriage was consented to and solemnised. Their maladies rapidly increased. The countess could not bear the least degree of cold, and her physicians ordered that her apartment should always be kept at a certain height of temperature. The count, on the contrary, required to be in a fresh and cool atmosphere. They consequently seemed to be doomed to an eternal separation even in this life. That, however, they might at least see each other, they were placed in rooms adjoining, the partition between which was plate-glass, through which they were able to communicate, but by looks and signs alone. Not more than one year elapsed between their wedding and their funerals.—*Galignani.*

Law.

CENTRAL CRIMINAL COURT.—*Abduction.—William Burton Newenham* was indicted for a misdemeanour, in having unlawfully taken Frances Wortham, under the age of 16 years, from the custody of her mother, and against her will. The prisoner was found guilty. Mr. Baron Gurney passed sentence, and observed with severity that he had been guilty of a crime of the worst description, having insinuated himself into the affections of a mere child, under the guise of friendship, and then induced her to fly from her home and the protection of her mother: he had then carried her to a distant part of the country, and solemnised, or pretended to solemnise, marriage with her; thereby completely ruining her happiness and destroying her peace of mind for the remainder of her life. The case had been most completely made out against him by Mrs. Wortham; and he had only aggravated his offence by instructing his counsel to cross-examine the mother, with a view to induce the jury to believe that she was a woman of abandoned habits, but he was happy to say that such shameful insinuations were totally without foundation, and that her only fault had been in relying and confiding too implicitly upon the prisoner's honour and integrity. Under all the circumstances of the case, a severe example was required, and the sentence of the Court therefore was, that he be imprisoned in the House of Correction for the space of two years. —*The Battersea Murder.—Augustus Dalmas* was indicted for the wilful murder of Mary Macfarlane on Battersea-bridge, and found guilty. The particulars of this murder are already known to our readers, and no new evidence was adduced. The prisoner made a declaration that he was not near the bridge on the night in question. Baron Gurney passed sentence of death, ordering the prisoner to be executed at Horsemonger-lane gaol.—*The alleged Murder at Wimbledon.—Charles Hall*, plasterer, was indicted for the wilful murder of his wife. Several witnesses were examined, and repeated their statements made before the Coroner, which have already appeared, when the jury stopped the case, and, with the concurrence of the Court, acquitted the prisoner, the Coroner's Jury having returned a verdict that the deceased died a "Natural death."—*The Irish Bank Parcel Robbery.—Mr. James Egan*, late manager of the Moate branch of this bank, was indicted for feloniously receiving one of the stolen notes of 100*l.*, well-knowing it to have been stolen. The facts of the case are well known. The robbery took place in Dec. 1842, from which time to April last, nothing was heard of the bank parcel. The prisoner was tried for the robbery at the time and acquitted. He then brought an action against the bank directors, for the false accusation and imprisonment, and recovered 6*d.* damages with costs. In April last he came to town and changed the 100*l.* note, which was stopped at the Bank of England, and traced to him. When taken into custody he at once said he was the man who had passed the note. The Recorder asked Mr. Clarkson, would not these facts, if proved, rather substantiate a charge of stealing than receiving. Mr. Clarkson suggested, that though he might have been originally the thief, yet if he passed away the property and subsequently received back from his accomplice part of it, as his words "remitted to him" would imply he had, that would be sufficient to substantiate the charge of feloniously receiving. A juror asked Mr. Clarkson if he had evidence of the note being remitted to the prisoner. Mr. Clarkson replied in the negative. The Recorder put it to the jury, whether, under these circumstances, they could, if all the facts as opened by the learned counsel were proved, return a verdict of guilty? The jury replied in the negative, and a verdict of acquittal was accordingly returned.—*House-breaking.—Daniel Dearlove*, aged 35, chemist, was indicted for feloniously breaking and entering the dwelling-house of James Dearlove, and stealing two bank notes of 100*l.* each, one of 50*l.*, three of 10*l.*, two of 5*l.*, several bills, eight sovereigns, and other monies to the value in all of about 2000*l.* The prisoner was found guilty and sentenced to 15 years' transportation. During the trial, the King of Saxony, attended by his suite, and accompanied by the Lord Mayor, Lord C. Wellesley, Baron Gersdorff, Sheriffs Moon and Musgrove, the under-sheriffs, and several aldermen, entered the court. His Majesty sat on the bench during the remainder of the trial, until the Recorder had concluded his summing up, and seemed to pay particular attention to the proceedings.

BIRTHS.—12th inst., at Grovehill, Mrs. T. PIPER, of a daughter—13th inst., at Holbeach, Mrs. E. KEY, of a son—14th inst., at 11, Welbeck-st., the lady of J. PATERSON, Esq., H.C.S., of a son—14th inst., at Westwell Vicarage, Kent, the lady of the Rev. J. A. Ross, of a son, still-born—15th inst., at Kingston-upon-Thames, Mrs. B. SEELEY, of a daughter—15th inst., in Montagu-place, Mrs. W. STUTFIELD, of a daughter—15th inst., in Chester-street, Grosvenor-place, Mrs. G. SCOVELL, of a daughter—16th inst., at No. 6, Upper Berkeley-street, Portman-square, the lady of J. HICKS, Esq., of a daughter—16th inst., the lady of T. GRUNBER, Esq., of Grove-lane, Camberwell, of a daughter—17th inst., Mrs. A. HILL, of Burnham Priory, of a daughter—17th inst., at Stanway Hall, near Colchester, the lady of C. BREWSTER, Esq., late of the Royal Regiment, of a daughter.

MARRIED.—On the 4th inst., J. R. ORMSBY GORE, Esq., Groom in Waiting to her Majesty, eldest son of W. O. Gore, Esq., of Porkington, M.P. for North Shropshire, to SARAH TYRRELL, youngest daughter of Sir J. T. Tyrrell, Bart., of Boreham House, M.P. for North Essex—4th inst., at Great Totham, Essex, C. W. JOHNSON, Esq., of Gray's Inn, barrister-at-law, to MARY ANN GOWER, eldest daughter of the late R. H. Gower, Esq., of Ipswich—4th inst., at Cadoxton-juxta-Neath, CHARLES JONES, Esq., of Garthmill-hall, Montgomeryshire, and Downfield, Stroud, to JANE VALENTINE, youngest daughter of the late J. Valentine, Esq., of Ludlow—11th inst., at the residence of the British Minister, in Switzerland, W. BROWN, Esq., of Monckton Farleigh-house, Wilts, to SELINA WILMOT, second daughter of Sir J. E. Eardley Wilmot, Baronet, Governer of Van Diemen's Land—18th inst., at Trinity Church, Chelsea, W. HUNTER, M.D., Surgeon Major, Coldstream Guards, to HELEN WILKIE, daughter of the late Rev. D. Wilkie, minister of the parish of Cults, Fifeshire, and sister of the late Sir David Wilkie, R.A.

DIED.—On the 16th of April, at Cossipore, the Hon. Major-General Sir WM. CASEMENT, K.C.B., Member in Council. He had served his country for 47 years, and was about to return home, when he fell a victim to cholera, in the 64th year of his age—8th May, at Malta, returning to England for the recovery of his health, J. F. TAIT, Esq., one of the Government Surveyors for the Island of Ceylon—12th inst., at Leeds, F. FREER ROBERTSON, eldest son of the late W. Robertson, Esq., Assist.-Commissary General to the Forces—14th inst., at Brussels, Mr. E. G. HOWIS—14th inst., after a few days' illness, ANNA M. WOOD, relict of P. W. Wood, Esq., and daughter of the late J. Cowley, Esq., of Guildford-street, aged 52—15th inst., at Camberwell, MARY C. EDWARDS, daughter of Mr. John Edwards, aged 12—15th inst., EMILY HUGHES, the wife of P. Hughes, Esq., 25, Fitzroy-square—15th inst., at Boulogne-sur-Mer, T. CAMPBELL, Esq., the author of the "Pleasures of Hope," &c.—16th inst., ELIZ. CHARRINGTON, daughter of the late J. Charrington, Esq., aged 23—16th inst., at the house of her son-in-law, Mr. S. S. Hall, Circus, Minories, Mrs. DE BIE, relict of G. De Bie, Esq., late of the Grove, Stratford, Essex—16th inst., at Walworth, ALICE C. BARRY, youngest daughter of C. Barry, Esq.—17th inst., FRED. RHODES, youngest son of T. Rhodes, Esq., of Handsworth, Staffordshire, aged 28—17th inst., at his residence, East Dulwich, J. JACKSON, Esq., aged 52—17th inst., at the Vicarage, Great Bedwyn, Wilts, ANN WARD, wife of the Rev. J. Ward, M.A., and eldest daughter of S. Merriman, M.D., of Brook-street, Grosvenor-square—18th inst., at her house, Highbury-place, Islington, SARAH FAIRBROTHER, relict of the late W. Fairbrother, Esq., aged 84—18th inst., the infant son of W. SPERD, Esq., of Lincoln's Inn—18th inst., at Oxford, CECILIA HARRINGTON, wife of the Rev. R. Harrington, D.D., Principal of Brazenose College—18th inst., at his residence, Melbourne-street, Royston, Cambridgeshire, J. WORTHAM, Esq., aged 90—18th inst., at the house of his friend, N. Clifton, Esq., Cross-street, Islington, F. COOKE, Esq., of Gibson-square, and late of the Hon. E.I.C.S.

A LUXURY FOR WARM WEATHER.

BERDOE'S SUPERIOR LIGHT SUMMER FROCKS, WATERPROOF. A variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

TO LADIES.

ROWLAND'S KALYDOR.—This Royally Patronised and universally adopted Specific is a balmy, odoriferous, creamy Liquid, composed chiefly of extracts from the most rare Flowers and Herbs of an Eastern Clime. Its discovery was no less singular (by a Lady of rank), than its effects have been felicitous, during the last thirty years. It is the mildest and most efficacious preparation ever known for dissipating Tan, Pimples, Freckles, Discolorations, and other Disfigurements of the Skin. The radiant bloom it imparts to the Cheek, and the softness and delicacy it induces on the Hands, Arms, and Neck, render it indispensable to every Toilet.

Gentlemen will find it peculiarly grateful after shaving, in allaying irritation of the skin, and in rendering it soft and smooth.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per Bottle, duty included.

CAUTION.—The great demand for this article excites the cupidity of *unprincipled Shopkeepers*, who vend the most *spurious trash* as the "GENUINE KALYDOR:"—whereas the genuine article is prepared solely by A. ROWLAND and SON, and the amalgamation of its *costly exotic* materials renders abortive any attempt to discover its component parts—thus proving the imposition of all other articles bearing the title of "KALYDOR." The genuine article has the words "ROWLAND'S KALYDOR" on the Wrapper.

*** All others are FRAUDULENT COUNTERFEITS!!!

FIDDLE and PRINCE ALBERT'S PATTERN PLATE.—A. B. SAVORY and SONS, Manufacturing Silversmiths, No. 14, Cornhill, opposite the Bank of England.—The best wrought SILVER SPOONS and FORKS, fiddle-pattern, 7*s.* 2*d.* per ounce; the Prince Albert's pattern, 7*s.* 6*d.* per ounce. The articles may be had, lighter or heavier, at the same price per ounce:—

The Fiddle	oz.	*s.*	*d.*	£	*s.*	*d.*	Prince Albert's	oz.	*s.*	*d.*	£	*s.*	*d.*

Messrs. SAVORY and SONS recommend the Prince Albert's Pattern; it is very novel, and of unexampled beauty.

DRESS AND FROCK COATS.

DRESS COATS, Superfine Cloth, 27*s.*; extra quality, 35*s.* and 40*s.*; Imperial Saxony, 50*s.*; Frock Coats, Silk Facings, 30*s.* to 40*s.*, extra quality, Silk Velvet Collar, and Silk facings, 48*s.*; Saxony ditto, 55*s.*; Children's Silk Tunic and Hussar Suits, 30*s.*; Waistcoats, new patterns, 5*s.* 6*d.* to 10*s.* 6*d.*, Trousers, 6*s.* 6*d.* to 10*s.* 6*d.*; excellent Doeskin, 12*s.* to 16*s.*; Summer Coats, 6*s.* 6*d* to 10*s.* 6*d.*; Chesterfield Over Coats, with Silk Collars and Cuffs, 15*s.* to 21*s.* The much approved new style, 21*s.* A suit of Black Cloth, 2*l.* 5*s.*; extra quality, 3*l.* 3*s.*; Imperial Saxony Suit, warranted to retain its colour, 4*l.* 4*s.*, at FISHER and Co.'s, Tailors, 31, King William Street, City, 10 doors from London Bridge.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes, of improved graduated and powerful friction. Velvet Brushes, which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

AGRICULTURAL TRAINING SCHOOL, including General and Scientific Education. Under the Patronage of several influential Noblemen, Gentlemen, and eminent Practical Agriculturists.

It is proposed, on the 24th September next, to OPEN an ESTABLISHMENT, near London, for the BOARD and EDUCATION of PUPILS, where the subjects connected with Agriculture will form the prominent features of the school.

The course of education embraces the classics, mathematics, mechanics, physics, chemistry, botany, mineralogy, geology, geodesy, drawing, French and German languages, and literature.

The School Session is divided into three terms, viz.:—From the 17th of September to Christmas, from Christmas to Easter, from Easter to the 1st of August. The vacations are three weeks at Christmas and six weeks in the summer.

Eminent public teachers are engaged to deliver during the Session a Course of Lectures on the several subjects applicable to Agriculture.

A Library, Museum, and Laboratory is attached to the School, and an examination of the pupils will take place at the end of the Session.

The terms are so arranged as to include every expense, except for books. For pupils under twelve years of age, forty guineas; above that age, fifty guineas the Session.

Noblemen, Gentlemen, and Agriculturists, interested in promoting the above object, will please to make early applications for admission to "The Principal of the Agricultural Training School," care of Messrs. Longman and Co., Paternoster-row, London, that suitable accommodation may be provided for the number entered.

Lectures will be delivered on the following subjects during the Session:—

Principles and Practice of Agriculture.
Botany and Vegetable Physiology.
Chemistry, Mineral and Vegetable.
Mineralogy, Geology, &c.
Management and Diseases of Cattle.
Mechanics, Physics, Land Surveying.

PIANOFORTES.

LUFF & CO., MANUFACTURERS, 103, Great Russell-street, Bloomsbury. The cheapest house in London for a first-rate warranted Pianoforte.—Free use of case, and exchange allowed.—LUFF AND CO., 103, Great Russell-street, Bloomsbury.

WANTED, at Michaelmas next, a Man and his Wife, free of all encumbrance. The Man must understand stock and farming; the Woman milking, cheese, and butter-making, also the care and rearing of poultry. None need apply who cannot give the highest and longest reference for character, as X. Y. will make all inquiries in person. Honesty, industry, and very good temper, are the greatest requisites, as all their movements will be directed for them. Direct to O. O., Office of this Paper.

WANTED an active young Man, who understands growing Geraniums, &c., and will make himself generally useful.—Apply at the Bedford Conservatories, Covent-Garden.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A steady, active respectable Man, who can have an unexceptionable character from his present employer, and whose Professional Abilities and moral character will bear the strictest investigation. The Advertiser is 40 years old, married without family. His wife is an excellent cook, and a situation where she could have employment would be preferred.—Direct to C. D., Post-office, Ringwood, Hants.

AS HEAD GARDENER.—Mr. GEORGE MILLS, Gardener, Gunnersbury Park, Acton, Middlesex, can with all confidence recommend a young Man to any Nobleman or Gentleman in want of a competent and trustworthy servant in the above capacity. He is 27 years of age, and has served him two years in the above establishment.

AS GARDENER.—A Single Man, aged 34, who perfectly understands his business in all its various branches, the Vinery, and all kinds of Forcing, Fruit, Kitchen, and Pleasure Gardening. Can be highly recommended by the gentleman he has just left, where he lived upwards of 9 years; has no objection to live in the house or out.—Direct A. B., to the care of Mr. KEY, Nurseryman, Finchley.

AS GARDENER, OR GARDENER, FORESTER, AND BAILIFF.—A married Man, 38 years of age, who thoroughly understands the above in all their branches, who has had considerable experience in some of the principal places in Cheshire and Wales.—Reference to J. HAMILTON, gardener, A. PHILLIPS, Esq., Thornfield-house, Heaton Norris, near Stockport; or E. H. MARTIN, Esq., Henhull Cottage, near Nantwich, Agent to the Right Honourable Lord Crewe; or G. B. near Nantwich, Cheshire.

AS GARDENER.—A Respectable Married Man, aged 38, who understands Pines, Grapes, Early Forcing, Kitchen and Flower Garden; has the management of Land and Stock and his Wife the Laundry in his present situation; and who is leaving through his employer giving up his country residence. Is at liberty, if immediately wanted; or until the 29th of September, would engage as Gardener without the charge of Land or Stock, or the Laundry. Most satisfactory testimonials of three years' character will be given.—Direct to the Gardener, Chelshem Lodge, near Croydon, Surrey.

A GENTLEMAN wishes to recommend as GARDENER a very respectable, steady, and intelligent man, who has lived with him for the last two years and a half. He thoroughly understands his business in the management of a Conservatory; Forcing, and all its usual details. He is married, with a family; his wife, a very respectable person, could assist in a laundry, if required.—Direct to W. B., at Mr. J. C. Wheeler's, Nurseryman, Northgate-street, Gloucester. Personal inquiries would be answered by Messrs. Chandler, Vauxhall.

AS GROOM, and is also willing to make himself useful in a Garden, a Young Man. He can have a seven years' character.—Direct to A. Z., Mr. Heywood, Grocer, Lower Phillimore Place, Kensington.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 26.—1844. SATURDAY, JUNE 29. [Price 6*d*.

GARDENERS' BENEVOLENT INSTITUTION.—At the Horticultural Exhibition, held at Bromley, on the 11th inst., the following Extra Prize was awarded to Mr. Hally, for a Dish of his Seedling Strawberries, "Princess Alice Maud." It should have been for a "Dish of Fisher's Seedling Strawberries, *Princess Alice Maud*.—E. R. Cutler, Secretary.

FLORICULTURAL SEEDS.

J. CARTER, Seedsman and Florist, No. 238, High Holborn, London, begs leave to recommend the following Seeds for present and autumn sowing. The Annuals he has selected will flower in the autumn if sown this month. He would recommend a second sowing early in September; for those sown in the autumn will flower earlier, and much finer, than the spring sown, particularly in dry seasons like the present.

1.—Hardy Annuals in Assortments.

8 fine Calliopsis	2*s*. 0*d*.	8 fine Schizanthus	2*s*. 0*d*
8 — Clarkia	1 6	20 — *German Stocks	5 0
12 — dwarf Larkspur	2 6	8 — *Tenweek	2 0
8 — tall Larkspur	1 6		
7 — Nemophila	2 0	40 — hardy Annuals	8 0
8 — Godetia	1 6	20 — ditto	4 0
6 — Gilia	1 0	10 — ditto	2 0

* All Stocks require protection in winter, the others not.

2.—Hardy Biennials and Perennials.

8 fine Campanula	2*s*. 0*d*.	12 fine *Queen Stocks	3*s*. 6*d*.
8 — Dianthus	2 0	6 — ditto	2 0
8 — Pentstemon	2 6	5 — *Brompton	2 0
8 — new Scabious	2 0	40 — Perennials	10 0
6 — Antirrhinum	1 6	20 — ditto	5 0
6 — Aquilegia	1 6	10 — ditto	2 6
20 — Hollyhock	4 0		

3.—Greenhouse Seeds.

10 fine Sorts	4*s*. 0*d*.		Per packet,
8 — Climbers	4 0	Finest mixed Cineraria	1*s*. 6*d*.
8 — Alstræmeria	4 0	— Calceolaria	1 6
4 — Thunbergia	2 0	— Gloxinia	1 6
3 — Portulaca	1 6	— Erica	2 6
3 — Tropæolum	2 0	— Gladiolus	1 6
Chinese Primrose, m.	1 0	— Verbena	1 0

And most other Flower Seeds contained in his General Catalogue for 1844.

*** A comprehensive Catalogue of Dutch Bulbs will be published at the usual time.

NEW PLANTS.

R. GLENDINNING very respectfully begs to offer the following New and Valuable Ornamental Exotic Plants:—

CLERODENDRUM INFORTUNATUM.—This new and magnificent species, surpassing all others of the genus yet introduced, was awarded the Large Silver Medal at the Horticultural Society's Exhibition on the 15th inst.

PENTAS CARNEA.

LISIANTHUS GLAUCIFOLIUS.

Do. NIGRICANS.

ACHIMENES PICTA.—R. G. obtained the Knightian Medal on the 15th inst. for this very fine new species.

GLOXINIA.—Four new varieties, two of which have been awarded the Banksian Medal. A Figure of the Group will shortly appear in the "Botanical Register."

Chiswick Nursery, near London, June 26, 1844.

CHOICE FLOWERS AND PLANTS IN POTS.

HUMPHREYS'S SOLUBLE COMPOUND.—A few grains occasionally dissolved in the water used with Plants produce a vigorous growth and splendid flowers. If what is called a "*Liquid Guano*" is desired, a superior article is obtained at half the usual cost, by dissolving Half a Bottle of this powder in a *quart of water*, and using a table-spoonful to a gallon in watering flower-beds. See *Gardeners' Chronicle* for June 15th, page 390. *Sold in bottles*, 1*s*. 9*d*. *each*, by Chemists and Seedsmen. Agents, Davy, Mackmurdo and Co., 100, Upper Thames-street, London.

MAGICAL EFFECT ON FLOWERS.—*Gardeners' Chronicle*, April 27th.—"I cannot speak of POTTER'S LIQUID GUANO in adequate terms of praise. I tried it on Hyacinths, and other Flowers. The effect was magical. My flowers were the finest I ever beheld, and they preserved their beauty nearly double their usual time."—*W. Kidd, Hammersmith.*

"I write to describe the wonderful efficacy of POTTER'S LIQUID GUANO; Peas, Onions, and Asparagus have been singularly improved by it. People came to admire the appearance of the garden."—See *Chronicle*, p. 406.

*** Beware of an inefficacious imitation. See *Chronicle*, p. 405—"Humphreys's Compound."

Sold by most Chemists and Seedsmen.

Factory, 28, Upper Fore-street, Lambeth.

JOHN STANDISH, Nurseryman, Bagshot, begs to inform his Friends and the Public that he is now sending out his SEEDLING FUCHSIAS, which he can strongly recommend, four of which, marked with an asterisk, are the largest yet sent out. See Paxton's "Magazine of Botany" for March.—Also now ready, his new SALVIA BICOLOR, which he has proved to be perfectly hardy, and one of the most beautiful showy herbaceous plants of the present day. Likewise a New Pink GERANIUM, for Bedding, which was raised from the Frogmore Scarlet, being exactly like that plant in habit, foliage, and shape of flower, only of a delicate pink colour with a white eye.

*Fuchsia Colossus	7*s* 6*d*		Fuchsia Conductor	5*s* 0*d*
* ,, President	7 6		* ,, Candidate	5 0
* ,, Attractor	7 6		,, Antagonist	5 0

Or the set of six plants, 31*s*. 6*d*.

Salvia Bicolor . . . 5*s*. 0*d*.

Geranium Lucia Rosea . . 3 6

N.B.—A remittance is expected from unknown correspondents.

WARNER AND WARNER, Seedsmen, 28, Cornhill, London, beg to offer the following SELECT SEEDS, which they can confidently recommend:—

Calceolaria, saved by an Amateur, from the most splendid flowers	1*s*. per paper.
Campanula, double, blue and white, mixed	6*d*. ,,
Delphinium album	6*d*. ,,
Pansy, saved from the finest named flowers	1*s*. ,,
Stocks, Giant Brompton, three colours (each)	6*d*. ,,
Hollyhocks, double, very fine	6*d*. ,,
Sweet-William, double (variegated)	6*d*. ,,
Lychnis fulgens	6*d*. ,,
Œnothera, three new varieties, mixed	6*d*. ,,
Primula sinensis fimbriata	6*d*. ,,
Wallflower, Giant, new double	6*d*. ,,
Cabbage, Warner's Incomparable; very early and fine flavour	6*d*. ,,

28, Cornhill, June 28, 1844.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks, which are ornamental in appearance, can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. Rendle, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

BURBIDGE AND HEALY'S NEW BOILER and FURNACE for HORTICULTURAL PURPOSES.

Registered under 6 & 7 Vict., Cap. 65.

No. 130, FLEET STREET, LONDON.

Burbidge and Healy respectfully inform the Horticultural Public that they have constantly on hand an extensive assortment of their new Boiler and Furnace Doors. In very numerous cases where they have been fixed, they have the highest testimonials of their complete success: for the further assurance of those who may require this apparatus, Burbidge and Healy refer them to the Horticultural Society's Gardens, Chiswick; also to Mr. Glendinning, Garden Architect, &c. &c., Chiswick Nursery, in the same neighbourhood, where the apparatus may be seen in successful operation, in connection with their new Tanks. The following are the present prices:—

Plain Boiler.		Patent Door and Frames.	Fire-bars & Dead Plate.		Flue Door.		Damper.		Will heat of Pipe.	Forcing Pit, Length by feet.
in.	£ *s*.	*s*.	*s*.	*d*.	*s*.	*d*.	*s*.	*d*.		
10	1 5	20	7	6	6	6	2	6	30 feet.	12 to 20
Ribbed Boiler.										
10	2 2	20	10	6	7	6	2	6	50 to 70 ft. 4 in.	Under 25 to 40
12	2 15	30	12	6	7	6	3	6	80 to 125 feet.	40 to 65
14	3 10	35	17	5	8	6	4	6	150 to 250 feet.	65 to 100
18	5 5	42	25	0	8	6	5	6	300 to 400 feet.	Warm a grapery 35ft. long, and a pit 50ft.
24	8 15	50	35	0	8	6	7	6	600 to 800 feet.	

If 3-inch pipe be used, one-third more. If 2-inch pipe, as much more.

The above quantities are rough estimates, which may be varied by enlarging or contracting the fire, or by regulating the fire door. It is possible to heat a much larger quantity of pipe with the boiler, but it would be done at great loss of fuel. The above proportions can be generally relied on as a near approximation to what is correct.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

FOR TURNIPS.

THE Urate of the London Manure Company, 4 guineas per ton. The London Manure Company have great pleasure in acquainting their friends that they have this day reduced the Urate from 5*l*. to 4 guineas per ton, at the same time pledging themselves that the quality shall be fully maintained. The Urate will be found most valuable for Turnips, by promoting a rapid growth; it secures a full plant, at the same time producing a great weight per acre, and extending its beneficial effects to the succeeding crops. It may be sown broadcast, or, which is preferable, by the drill, at the rate of one ton to 3 acres; and it is desirable it should not be placed more than 2 inches below the surface. Gardeners and Florists will find it very useful for Dahlias, and other roots. Full particulars and testimonials will be forwarded on application. Genuine Peruvian Guano; Phosphate and Sulphate Ammonia; Gypsum, and every other artificial manure.—Edward Purser, Secretary, 40, New-bridge-street.

TURNIP SEASON.

GUANO (Foreign and Potter's). RAPE-DUST, BONE-DUST, CLARKE'S COMPOST, and all other MANURES for the TURNIP CROP, to be had on the best terms, of Mark Fothergill, 40, Upper Thames-street.

GUANO (GENUINE PERUVIAN & BOLIVIAN) ON SALE, BY THE ONLY LEGAL IMPORTERS,

ANTONY GIBBS AND SONS, LONDON;

Wm. J. MYERS AND CO., LIVERPOOL;

And by their Agents,

COTESWORTH, POWELL, AND PRYOR, LONDON;

GIBBS, BRIGHT, & CO., LIVERPOOL and BRISTOL.

47, Lime-street. June 28, 1844.

GUANO.—For Sale, in bags of 1 cwt. each; just landed, with a succession of cargoes to arrive.

There being considerable variety in the qualities of Guano imported from different places, and indeed from the same island, each parcel will be chemically analysed with the utmost precision, to show its relative productive power. A copy of such analysis will be given to buyers, and also instructions as to the most approved mode of using the Guano, furnished by the experience of eminent Agriculturists in England and Scotland.

Large parcels will be delivered direct from the ship, or waterside premises. Smaller quantities may be had at the warehouses, 24 and 25, Billiter-street; or delivered within any reasonable distance, at a trifling additional cost.—Apply to James Clark, 24, Billiter-street.

MANURES.—The Readers of the *Gardeners' Chronicle* must have noticed the complaints constantly made there of the Adulterations of Manures, and which are now carried on to a fearful extent.

The Advertiser, a Broker of the City of London, and in daily communication with several scientific Chemists, calls the attention of the Nobility, Agriculturists, and Farmers to his method of supplying Manures, by which a genuine article is secured. Each article is Analysed, and the Analysis forwarded to the purchaser, who can by this means obtain redress should the article differ from the Analysis.

Terms, Cash and one per cent. commission for buying and forwarding.

A register will be kept of the Analysis of every cargo of Guano imported into London that is brought in the market.

Price-current, London, June 12, 1844:—

Bones	p. ton	£4	10*s*. 0*d*	Nitrate of Potash	£1 4*s*. 6*d*
,, crushed, 5*l*. 10*s*. to		6	0 0	Oil of Vitriol, or Sulph. acid	p. lb. 0 0 1
,, calcined		7	0 0	Rape Cakes	p. ton 4 15 0

Wm. Northcott, 13, Rood-lane, Fenchurch-street.

TO GARDENERS AND AGRICULTURISTS.

SUPER-PHOSPHATE of LIME is capable of producing a more rapid vegetation in Plants than any substance known. It may be had at Mr. Lawes' Factory, Deptford Creek, price 7*s*. per cwt.

Phosphate of Potash, 15*s*. per cwt.
,, Soda 12*s*. ,,
,, Magnesia 9*s*. ,,
,, Ammonia 1*s*. per lb.

TURNIP SOWING. — BRAIN'S ENGLISH GUANO MANURE.—This powerful Manure having been subjected to the most rigorous Analysis by some of the first Agricultural Chemists of the day, it is pronounced by them to be much stronger, and to possess more highly fertilising properties, than the very best samples of foreign brought to this country. Price 9*l.* per ton; no charge for sacks, and delivered free of charge to any wharf, railway, or waggon-office in town. —Address, FREDERICK BRAIN, Guano Works, Thomas-street, Stamford-street, Blackfriars-road, London.

N.B.—Directions for use sent with all orders.

TURNIPS, &c.

DR. HALLETT'S DRY SOLUBLE FERTILISERS are composed of all the useful ingredients of the best Foreign Guano, which manure is already nearly exhausted, and no two parcels of which were ever alike. They contain also other ingredients equally useful, and are always to be produced of uniform strength; they are improvers of all soils, but most so of poor ones, and cannot possibly prove injurious to soil or crop, as they contain no heating or caustic materials, being simply and purely Fertilisers. Five cwt. of either of them is equal to nearly 30 tons of horse-manure as a Fertiliser. They are used, the one for all the varieties of Corn, Peas, Beans, Chicory, &c., and the other for Turnips, Mangold Wurzel, Natural and Artificial Grasses, and al Gardening purposes. This is the best protector yet discovered against the Fly in Turnips, for it gives a first growth three weeks beyond that of any other known Manure. Price of each Fertiliser, 10*l.* per ton, or 12*s.* per cwt.

Sold by Mr. FOTHERGILL, 40, Upper Thames-street; and Mr. G. HALLETT, at the Factory, Broadwall, Blackfriars, London. The Fertilisers are manufactured under the immediate inspection of J. J. HALLETT, M.D., &c.

Agents for London, Messrs. WINSTANLEY, Chemists, 7, Poultry; Suffolk, Mr. W. REVANS, Yoxford; Norfolk, Messrs. BULLARD and WATTS, Norwich; Jersey, Mr. C. Kruger. Respectable country agents wanted.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.

THE above Material has been used and approved by the Nobility, Gentry, and Agriculturists generally, as a Roofing and Covering to sides of Farm Buildings; its advantages are—Lightness, Durability, and Economy. Being a non-conductor, it has been proved an efficient Protective Material to Plants, and is now in use at the Royal Horticultural Society's Gardens, Chiswick. It can be had of any length, 32 inches wide, at 1*d.* per foot, super. A discount to the trade.

THOS. J. CROGGON, 8, Ingram-court, Fenchurch-st., London.

IMPORTANT TO FLORISTS, HORTICULTURISTS, AND OTHERS.

TANNER'S VITREOUS FLUID and CLOTH, being a SUBSTITUTE for the GLAZED FRAMES of HOTBEDS, CONSERVATORIES, &c.

The Proprietor, in introducing the above Preparations, feels confident a very important desideratum is presented to the Public, combining utility and economy.

A Conservatory or Greenhouse may be built at a very moderate cost, with all the advantages of Glazed Frames. A Forcing-bed covered with this cloth is not only less expensive, but yields many other advantages—not requiring the attention of the ordinary kind, admitting a more genial light, preserving a uniform dewy moisture on the Plant, maintaining, without any other covering, a moderate temperature under the strongest rays of the mid-day sun, and the atmosphere requires only to be changed from time to time according to circumstances. It affords a certain Protection for Fruit trees, either from Frost, Blight, or excessive Heat, affording abundance of Light and Heat, for the expansion of the blossom, causing the Fruit to set and swell more freely, and much earlier.

The attention of the Nobility and Gentry is respectfully solicited to the above, which being Waterproof, and varying in texture, will prove equally suitable for Marquees, Blinds, covering Market Carts, Vans, &c.

Merchants and the Trading Classes will also find the above adapted for the Windows of Offices and Workshops, admitting a more agreeable light than glass.

Hand Frames of various sizes, covered with the Vitreous Cloth, may also be obtained of the Proprietor, and Agents.

Manufactured and sold by N. W. TANNER, Chemist, Exeter.

Directions for Use of Fluid with each Bottle.

Any persons residing in large towns or cities, desirous of becoming Agents, are requested to make early application.

YORKSHIRE LAND-DRAINING ASSOCIATION.—At a MEETING of the PROVISIONAL COMMITTEE held at YORK, this day, for the purpose of Allotting the Shares applied for in the Association, and on other business—

It was resolved, that the number of Shares now allotted being amply sufficient to justify the Committee in proceeding forthwith to carry out the objects of the Association, the necessary Deed of Settlement be prepared for execution. And that such of the Public as may yet be desirous of becoming Shareholders, and shall signify the same to the Solicitors, (Messrs. BLANCHARD, RICHARDSON, and GUTCH, York), or to the Secretary, (Mr. CHARNOCK, Wakefield), on or before the 31st of July next, shall be admitted (if the number of unallotted Shares be sufficient) on the same terms as the present Subscribers.

York, June 12, 1844. JAMES HAMERTON, Chairman.

WRIGHT'S STACK PRESERVER.—Hundreds of Stacks of fine Hay were saved from spontaneous combustion or discoloration in the neighbourhood of the inventor, by the use of the above invaluable instrument. The article may be seen, and bills obtained, containing testimonials to its value from experienced Farmers who have for many years proved its efficacy, at J. WRIGHT'S, Manufacturer, Ongar, Essex; J. and G. DEANE, Ironmongers, London-bridge; and of any Ironmonger in the country. Price, in box, with lock and joints, 2*l.* 5*s.*

HAYMAKING SEASON. — Agriculturists, and others who may require the assistance of WEDLAKE'S PATENT DOUBLE-ACTION HAYMAKING MACHINE, are requested to send their orders early to the London Depôt, No. 118, Fenchurch-street, opposite Mark-lane, where one of the Machines may be inspected.—Catalogues of Agricultural Implements and Machinery may be had on application.

CLEAR WHITE GLASS MILK-PANS.

APSLEY PELLATT, FALCON GLASS WORKS, Holland-street, Blackfriars-road, is still making the Milk-Pans—as described in the *Gardeners' Chronicle*, of clear white flint glass, at 5*s.* 6*d.* each, or 3*l.* per dozen. Early in July A. P. will make the Milk-Pans of green glass of excellent quality, at 42*s.* per dozen.

TO COLONISTS, AGRICULTURISTS, &c.—Mrs. MARY WEDLAKE, Widow of the late Mr. THOMAS WEDLAKE, of the Original Ironfoundry and Agricultural Implement Manufactory, established forty years, at Hornchurch, near Romford, Essex, and of 118, Fenchurch-street, London, begs to inform the Friends of her late Husband that she continues to Manufacture all kinds of Agricultural Implements, for the invention of which he was so often honoured with the medals of the Royal Society of Agriculture, and which obtained for him so high a distinction among the Farmers of England and British Colonists. Being assisted by men of talent in the manufacture of these articles, she is in hopes of deserving the high repute this Establishment has so long enjoyed, and now solicits respectfully a continuance of the patronage of the numerous friends of her late husband. The following articles, made in a very superior manner, are kept on sale at the London Warehouse, 118, Fenchurch-street, viz.—

Patent Hay-making Machines	Subsoil Ploughs
Winnowing Machines	Horse-power and Hand-Thrashing Machines
Dressing Machines	Patent Horse Rakes
Patent Chaff-cutting Machines	Scarifiers
Oil Cake Crushers	Drills of all kinds
Double-action Turnip-cutters	Park Fencings, Hurdles
Flour Mills	Furnace Bars
Bean Mills	Cast-iron Horse Racks
Railway Wheels, Vacuum Pumps	Kitchen Ranges
Patent Essex Ploughs, 30 different sorts	Stoves, Fenders

*** Castings to any pattern.

☞ For a more detailed List see Johnson and Shaw's Farmer's Almanack for 1844.

Please to be particular in the Address, MARY WEDLAKE, 118, Fenchurch-street, London; or Original Ironfoundry, Hornchurch, Essex.

AGRICULTURAL SCHOOL.

MESSRS. NESBITS' ACADEMY, 38, Kennington-lane, Lambeth, near London.

"From Chemistry alone further progress in Agriculture is to be expected."—LIEBIG.

In this School, in addition to the general routine studies, every facility is afforded for the acquisition of a sound knowledge of Chemistry. The Pupils are practically taught in the Laboratories the methods of analysing the various earths, soils, manures, &c.; and likewise the means of detecting the substances abstracted from the land by different crops. Land Surveying is also taught practically, as well as theoretically.

A copy of a Lecture on Agricultural Chemistry, delivered by Mr. J. C. NESBIT to the Maidstone Farmers' Club, and the Terms of the School, which vary from 40 gs. to 70 gs. per annum, may be had on application, either personally or by letter.

Mr. NESBIT'S Works on Land Surveying, Mensuration, Gauging, Arithmetic, English Parsing, Education, &c., may be had of all Booksellers.

REFERENCES.—Dr. D. B. Reid, F.R.S.E., &c., Author of "Elements of Practical Chemistry," &c., St. James's Park, Westminster; G. F. Richardson, Esq., F.G.S., Author of "Geology for Beginners," &c., British Museum, London; W. and J. Gibbs, Esqrs., Civil Engineers, Devonshire-street, Portland-place, London; Rev. T. Cuffe, Carlisle Episcopal Chapel, Lambeth; R. Greenhill, Esq., Ashford, Kent; and C. G. Whitaker, Esq., Barming, near Maidstone, Kent.

The School will be re opened on Monday, July 15th, 1844.

GLASS CHANDELIERS FOR DRAWING-ROOMS.—APSLEY PELLATT (late Pellatt and Green), Falcon Glass Works, Holland street, Blackfriars, has recently constructed a NEW CHANDELIER (Registered), which surpasses in brilliant and refractive effects all former efforts, to which he invites inspection. Renaissance and other Glass Chandeliers as usual at low prices, which, when lighted, have a far more resplendent effect than buhl. TABLE CUT AND ENGRAVED GLASS at the Printed List of Prices, subject to an extra discount for Cash. The manufactory and steam-cutting works may be seen any Tuesday, Wednesday, or Thursday. Merchants' orders and outfits for Glass and China on the very lowest terms. No connexion with any house in the City.

LEA AND PERRINS'S WORCESTERSHIRE SAUCE. Prepared from the Recipe of a Nobleman in the County.

"*Great Western Steam-ship, June* 6, 1844.—The cabin of the Great Western has been regularly supplied with LEA & PERRINS's Worcestershire Sauce, which is adapted for every variety of dish, from turtle to beef, from salmon to steaks, to all of which it gives a famous relish. I have great pleasure in recommending this excellent Sauce to Captains and Passengers for its capital flavour, and as the best accompaniment of its kind for a voyage. (Signed) JAMES HOSKEN."

"One of the most piquant inventions of this luxurious and epicurean age is Lea and Perrins's Worcestershire Sauce, adapted to fish, flesh, fowl, and soup: giving a zest far superior to the long-established favourites; more wholesome and of less cost." —*Naval and Military Gazette*, April 8, 1843.

Sold Wholesale by the Proprietors, Messrs. LEA and PERRINS, Worcester: Messrs. BARCLAY and SON, Farringdon-street; and the principal Oil and Italian Warehousemen in London; and Retail by the usual venders of Sauces.

PRESERVES and CONFECTIONERY. — The superiority of BETTS'S PATENT BRANDY for PRESERVES and CONFECTIONERY, is testified by the fact that it is preferred to any other spirit by the most extensive WHOLESALE CONFECTIONERS in the METROPOLIS; for fortifying Home-made Wines it is invaluable; as an Ordinary Beverage it is congenial to the most delicate constitutions; and, as a Medical Stimulant, it is peculiarly adapted to persons of bilious or dyspeptic habits. Quantities of not less than Two Gallons, supplied at the Distillery, 7, Smithfield Bars, in Stone Jars, at 18*s.* per Gallon, exclusive of the price of the Jar; and in Glass Bottles, at 20*s.* per Gallon, Bottles and Case included.

CONSUMERS of BRANDY are respectfully informed, that J. T. BETTS, JUN., and Co., will not be responsible for any BOTTLED BRANDY that is not protected against fraudulent substitution, by the PATENT METALLIC CAPSULES, made of pure and solid metal (*not tin-foil*), embossed with the words "Betts's Patent Brandy, 7, Smithfield Bars," *to which attention is especially directed.*

A LUXURY FOR WARM WEATHER.

BERDOE'S SUPERIOR LIGHT SUMMER FROCKS, WATERPROOF. A variety of the above, in NEW and greatly improved materials (in lieu of the unsightly rubbish made by slopsellers), now ready, guaranteed to exclude any rain whatever; and confidently recommended to those who regard a respectable appearance or wish to avoid disappointment and vexation.

FIRST-RATE CLOTHING of every description, upon the lowest terms possible, consistent with TRUE economy, and ultimate satisfaction.—W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (north side).

Sales by Auction.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, &c.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Bunney to submit to public competition, by Auction, on the premises, Kingsland Nursery, on Tuesday, July 9, 1844, and following day, at 11 o'clock (in consequence of the Lease having expired), the whole of the rare Exotics, and other plants in pots; consisting of fine specimens, Araucarias, Buonapartea, Juncea, Clivea Nobilis, Cactus, Gloxinias, Achimenæas, Magnolias of sorts, New Fuchsias, Gardenias; about 1500 Double and Single Camellias; several thousand China Arbor Vitæ, Sweet Bays, Arbutus, Cypress, &c., in pots; also eight Greenhouses, Pits, &c., in good condition; a considerable quantity of Bricks, York Paving, and other fixtures. May be viewed prior to the sale, and catalogues may be had of the principal Seedsmen, on the premises, and of the Auctioneers, Leytonstone.

The whole of the valuable Nursery Stock will be submitted to public competition, by Auction, about the third week in October.

CAPITAL INVESTMENT.—IMPROVABLE ESTATE in AYRSHIRE, with SALMON-FISHINGS, GROUSE-SHOOTING, &c.—FOR SALE IN ONE OR MORE LOTS.

THE ESTATE OF BALLANTRAE, extending to about 7164 acres imperial, with the Village and Harbour and the valuable Salmon-Fishings of the River Stinchar and the adjacent Sea-coast.

The Lands immediately around the village, about 1587 acres, form a compact and beautiful Estate, lying on both sides of the River Stinchar, and nearly two miles along the Frith of Clyde; and they afford many fine situations for a residence. The land in this division is arable, of superior quality, and capable of great increase of value, by draining, planting, and better cultivation. The remainder of the Estate, about two miles distant, consists of excellent Stock Farms, capable also of great improvement, by surface-draining and liming, and affords some of the best Grouse-shooting in the south of Scotland. The River Stinchar, and other streams on the Estate, abound with Salmon and Trout.

The present rental is only 1891*l.* 2*s.*; but the principal Farms are let at very low rents, and a considerable rise may be counted on. The public burdens payable by the proprietor are of trifling amount. The great post-road to Portpatrick passes through the village, and if the proposed improvements on the harbour are completed, Ballantrae will be the Shipping Port of the whole vale of Stinchar; and, with its valuable Fisheries, must become a place of some trade and importance. Ballantrae is about 15 hours' sail from Liverpool, 6½ hours' sail from Glasgow, and 12 miles from Girvan, to which latter place it is now in contemplation to continue the Ayrshire Railway.

If not immediately sold in one Lot, the Estate will be exposed as follows:—

1st. The MOOR LOT, extending to about 5577 acres, of which the present land rental is £375 0 0
And the shooting for the present season is let at . 50 0 0

Total rent . £425 0 0

2d, The FARM of LAGGAN and LAGGANHOLM, as at present possessed by Hugh Lockhart, James M'Meikan, John Murray, Mrs. M'Kinna, &c., with 13 acres of thriving young Plantations, extending to about 450 acres, at present let at £416 4 3

There is a neat, small, modern Mansion on this lot, like a good Farm-house, and the principal part of the Land is out of lease at Martinmas next.

3d. The REMAINDER of the LANDS of LAGGAN and GARLEFFAN, including the Mill and Mill Lands, extending to about 232 acres, at present let at £175 2 9

4th. The LANDS on North side of the River Stinchar, with the Salmon-Fishing, Harbour, and Village, extending to about 905 acres, at present let at 874*l.* 14*s.* 9*d.*, will be exposed along with Lots 2d and 3d, but will not be separately sold till these two Lots are disposed of.

James M'Gregor, Ballantrae, will show the Lands; and for further particulars application may be made to George Guthrie, Esq., factor, Culhorn, near Stranraer; or to Æneas Macbean, Writer to the Signet, Edinburgh.—Edinburgh, 24th May, 1844.

TO BE SOLD by AUCTION, some time next Autumn (unless previously disposed of, but of which due notice will be given), the whole of a NURSERY STOCK, consisting of choice Fruit and Forest Trees, Shrubs, &c. &c.

The unexpired Lease of the Nursery Ground will be Let. The House, Shop, and Premises (where a large and increasing Seed business has been carried on for the last 30 years) will be either Sold or Let for a Term; if Sold, part of the purchase-money might remain on Mortgage. Any person desirous of treating for the same may apply to ALEX. SMITH, Nursery and Seedsman, Cirencester.

NURSERY.

TO BE LET, a Nursery, containing about 2 acres in a most desirable situation, in the centre of the West Riding of Yorkshire, in a good state of cultivation, with a Pinery, Greenhouse, Vinery well stocked, and in excellent state of bearing, and newly-erected Hot-water Propagating House, 90 feet long, 10 feet wide, with sheds, &c. Valuation moderate. Also 2 acres of Grass Land adjoining the Nursery.—For particulars apply to Mr. R. BARRATT, Solicitor, Wakefield.

Wakefield, June 28, 1844.

DARTFORD NURSERY.

FOR SALE, One Mile from the Town of Dartford, and 14 from London, a NURSERY BUSINESS, 14 Years established; a commodious house for business, with about 46 feet frontage, and 200 feet deep of Freehold Land; Greenhouse, 21 feet long; some Frames; all well stocked. Also the STOCK of TWO ACRES, held by Lease at 8*l.* per year; Lease about 9 years more to run. No doubt the Lease can be renewed.

Land now become worth 3*l.* per foot for building in this neighbourhood. A never-failing well of water, &c. &c. All offered for 800*l.*

N.B.—The Advertisement will be only once inserted in any paper, so that although the Advertisement may not appear, the Land, &c. may still be for sale.

METCALFE'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most effectual and extraordinary manner, and is famous for the hairs not coming loose—1*s.* An improved Clothes Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh Brushes of improved graduated and powerful friction. Velvet Brushes which act in the most surprising and successful manner. The Genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE'S Sole Establishment, 130B, Oxford-street, one door from Holles-street.

Caution—Beware of the words "From Metcalfe's," adopted by some houses.

ROSES.

E. DENYER begs to inform the Nobility, Gentry, and his friends in general, that his superb Collection of Roses are now in full bloom; the standard and dwarf Roses are planted on each side of a walk 660 feet, and consist of 500 varieties. Orders taken for the plants when in bloom, and delivered in November next. Admittance Gratis, daily (Sundays excepted). Loughbourough Nursery, Brixton, within 3 miles of London. June 28th, 1844.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN.—The Third Meeting will take place on Saturday, the 13th of July; on which occasion His Grace the Duke of Devonshire, the President of the Society, has kindly directed the doors of his Gardens and Pleasure-Grounds to be opened for the reception of all persons who shall have been admitted into the Garden of the Society by Tickets.—21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, JUNE 29, 1844.

MEETINGS FOR THE FOLLOWING WEEK.

TUESDAY,	July 2	Royal Botanic Gardens.	2 P.M.
		Horticultural . . .	3 P.M.
FRIDAY,	July 5	Botanical	4 P.M.

WE observe that a letter has been addressed to the Editor of the *Hereford Times*, by Mr. W. Godsall, strongly recommending all persons interested in the POTATO CROP, especially cottagers, to pull off the flowers diligently as soon as they appear. We beg to second that recommendation. All experience shows that flowers of the Potato are produced at the expense of that organisable matter which gives its value to the tuber, and which is diminished in quantity in proportion to the number of flowers that have been fed. For flowers must exist and feed on something, and that something is what would, if not removed by the flowers, descend beneath the ground and collect itself in the tubers.

The mere production of flowers is a loss; but the mischief is infinitely increased if the flowers are succeeded, as they almost always are, by the berries. The actual amount of loss produced by each truss of flowers is not ascertained; but it is probable that if the flowers abstract one ounce of organisable matter, the berries consume at least twice as much. Now, as Potatoes are not grown for the sake of either the flowers or the berries, every particle of matter which is consumed by the plant in producing them is a dead loss to the grower.

The man who makes his Potato-ground feed flowers prevents its feeding his children. Every ounce of matter consumed by the flowers is so much taken from the consumption of the family.

We cannot just now lay our hands on any precise evidence of how much is lost in this way. Mr. Godsall assumes it to amount to many hundred weights, or even a ton an acre; but he is in all probability under the mark. A bunch of Potatoe-berries weighs, we will say, half-a-pound. Suppose that each Potato-plant bears half-a-dozen bunches; that makes 3lbs. of worthless produce. An acre of Potato-ground carries about 20,000 plants on an average; this gives 60,000lbs. of waste. But of this 54,324lbs. will be water, according to Mr. Edward Solly's experiments, and only 5322lbs. organic matter. The latter, however, or 2 tons 7 cwt. 58lbs. would, according to this calculation, be the amount of loss sustained per acre, by allowing the Potatoes to flower and fruit.

Admitting, however, that this is an excessive statement; supposing it to be wrong by even one-half—and it can hardly be so much as that—still there is the most ample evidence to show the immense importance of preventing the Potato expending its energy in the wasteful production of parts which are of no sort of use for food.

IN the *Gardeners' Chronicle* of Oct. 21st, 1843, p. 735, descriptions and figures were given of Aspidiotus conchiformis, the APPLE-TREE MUSSEL, or DRY SCALE, which attacks various fruit-trees. It is there stated that "these scales do not lie in one direction, as others generally do, with their heads downward, for some of the Apple-tree scales are placed vertically, others obliquely, many have a transverse direction, and sometimes they are crowded together in immense multitudes in every possible position, even lying one over the other. The scales are hard, dark, and shining; they are exceedingly like minute mussel-shells, but rather more elongated; they are slightly curved, transversely wrinkled, rounded at the tail, and attenuated at the head, which is semi-cylindrical, less opaque, and of a rusty colour. These adhere firmly to the bark, having the margins beneath broad and woolly, and when dislodged, the space they had covered appears white. Within the shell is found a fleshy green female, occupying part of the cavity towards the tapering extremity, the hinder space being entirely filled with white oval eggs, amounting sometimes to 50 or more; they are rather larger than in most species, I think, and produce little white flat cocci, with two antennæ and six legs; they are lively and run about for several days, but having fixed themselves, they grow, and by degrees become very different creatures to what they were immediately after their birth."

As it is, according to all appearance, this same insect which, by the statement laid by several gentlemen connected with the Orange trade before the Entomological Society of London,* is now threatening the entire destruction of the Orange trees in the Azores, it may not be uninteresting to add some further observations which the facts already known supply, together with the best means of eradicating this pest.

It has been generally believed that the various scale insects are confined to particular species of plants and trees, and such is often the case; in this respect, therefore, the Mussel-scale differs essentially from others, for in England it attacks a variety of fruit-trees, amongst which are the Apples, Pears, Plums, Apricots, and Peaches, and in the Azores, the Mulberry and Orange-trees.

Although occasionally very numerous in this country, we are not aware of its having caused the destruction at any period which is reported to have followed its introduction into the Azores, where it has spread so rapidly under the mild temperature of those islands, that in three years it has destroyed all the Orange-trees in Fayal! If this scourge be not checked, many evils will be the result, and the inhabitants may well be alarmed at the calamity which threatens to deprive them of the profits arising from their Orange orchards; the public also may lose one of the best sources from whence they derive a regular supply of a luxury at once wholesome, grateful, and reasonable; for many years must elapse before the Orange-trees of the Azores, some of them 300 years old, and producing annually from 5000 to 6000 Oranges each, can be replaced; and even our revenue would suffer from the suspension of the trade.

We here have a striking proof of the importance of Entomology as a science, for the ravages of this insect can only be arrested by a knowledge of its economy; and we doubt not if some experienced Entomologist had been on the spot, the mischief might have been nipped in the bud. Whether it be too late to be averted can only be ascertained by the application of remedies under the guidance and inspection of scientific men, well-versed in the economy of insects.

If scraping the trunks and branches be resorted to—and we confess this seems to us the best mode of attacking the Mussel-scale—powdered unslaked lime, if it can be procured, should first be scattered thickly round the base of the tree, in order that those which fall down may be destroyed; or a fresh-tarred or painted circular board, divided across the middle with a central hole large enough to receive the stem, would do as well. The scales having been scraped off carefully with a wooden knife, the trunk and branches, as soon as they have been thus freed from the scales, should be washed over with some liquid, as a paint, to destroy the embryo young and eggs, many of which will otherwise remain uninjured.

To ascertain the most effectual wash, mixtures should be made of lime-water, of clay and urine, of cowdung and urine, of train oil, &c.; and if these be employed hot, the result will be attended with more complete success. The degree of heat which may be applied for the destruction of the insects, without injuring the trees, and the best of the mixtures, can only be ascertained by careful and judicious experiments. In the operation of applying these, a stiff painter's brush should be used, which will penetrate into the chinks and damaged places in the bark, so as to leave no space uncovered; for it is not only by destroying the old scales that benefit will be derived, by rendering the surface of the tree deleterious to the young scales, those which may escape the purification will be starved to death. Having some further observations to make upon the scales which affect the leaves and the fruit, we shall resume the subject hereafter. In the mean while, if any one could supply us with the maggots or pupæ, *in situ*, which live in and under the skins of decaying Oranges, we would make them the subject of a separate notice.—*R.*

FRENCH CULTIVATION of the PELARGONIUM.

THE following are the details of the *Propagation*, *Culture*, and *General Treatment* of the Pelargonium in France, as they have been furnished by M. Bataille, the Curator of the Botanical Garden at Avranches, in Normandy, who, while he fully admits that his theoretical remarks are compiled from French works of high authority, advances nothing in the practical portions that he has not ascertained from long and assiduous attention. I shall critically pursue his own order of arrangement in treating the subject.—*Martin Doyle.*

There are two divisions of the Pelargonium. No. 1 has tuberous roots, which may be divided into those without stems and those with them; No. 2—the roots are fibrous, and the species nearly all shrubby: this division has more cultivated varieties than the other.

The mode of vegetation in No. 1 differs from that of the other in this respect, that, being tuberous-rooted, the species are without any signs of growth during a certain season, and then the quantity of water given should be only enough to prevent the root from dwindling away: but as soon as it begins to give signs of life, the watering should be gradually increased, until the plant has entirely brought out its young leaves; then, if in summer, it should be plentifully watered, but not so much as a plant with fleshy roots; for the great quantity of mucilaginous matter which accumulates in all roots, whether bulbous or tuberous, keeps them alive for a considerable time without any water. The means of multiplying this race are not so numerous as those employed for propagating the other: the seeds and tubercles are generally used. The tubercles are distinct, yet they are joined by a thread which runs through each, so that by cutting it, one tubercle comes out alone without detaching the rest; this may be set like a slip or cutting, provided it be sunk so deep that the upper part is even with the ground. If the tubercle is fresh, by placing it under a bell-glass it will grow without being watered. The seeds should be sown as soon as ripe, in the early part of the summer, so as to give the young plant time to acquire strength before winter; but if they have not ripened in an early season, it is best to postpone the sowing until the following spring.

General Remarks on the Shrubby Pelargoniums.—To cultivate the shrubby species with success, the proper time for flowering should be kept in mind, so as to advance the plant by proper treatment with reference to that period. Flowers may be had in the middle of April, but the end of that month, or beginning of May, is the proper time for flowering, before which season the full beauty of the blossoms is not developed; because those which open before have formed their buds too early in the winter, and consequently are not in proper condition to undergo a critical examination. It is not before the month of May that the flower appears in its full splendour and perfection. The cuttings should be taken from shoots which are neither too woody nor too soft, and from branches of old stocks which had been topped after the flowering season. As soon as the cuttings are potted, which should be in August or September, they should be watered through a fine rose watering-pot, so as to settle the earth about the roots. A small stick should then be fixed to each cutting. As soon as the plants are habituated to the air, they should be placed in a greenhouse, or on a stand in some suitable room, care being taken that the sun's rays do not fall too directly on them; but air and light should be admitted freely when the weather permits. About a fortnight after they have been placed in the greenhouse, they should be cut down to the height of 3 or 4 inches, and even if they should be lower, topping is necessary, for it hastens the growth and branching; three or four buds are a sufficient number to encourage. To those who have no greenhouse, any exposed house will answer until the end of November, when the pots may be placed in some apartment which has a sufficiency of light and a southern aspect, and with windows which can be opened when the thermometer is not below 40°. In severe frost artificial warmth will be necessary, and draughts of external air should be excluded.

Watering.—Even if a plant has languished from want of moisture, heavy watering at one time is injurious, because the roots are not then in a fit condition to perform their functions all at once, but by wetting the earth gradually a healthy action will be induced. Watering in the middle of the day, and particularly in sunshine, is so injurious, that plants have been known to die suddenly after this operation, which should be performed in the morning during the winter months, and in the evening from the month of March until about the fifteenth or twentieth of October. When watering has been excessive, the foliage becomes yellowish, the faded leaves adhere to the stem, and the earth does not dry as quickly as usual. In such a case the plant should be taken out of the pot and have the roots examined, when these will be found decayed more or less; the mode of renovating the plant is to repot it, and keep it in the shade and sheltered from heavy rain. In April and May, syringe the plants gently which have not opened their flowers; and if the water is not sufficiently evaporated during the night, open the doors and windows early in the morning, to give a free circulation of air to dry the plants before the sun is too powerful.

Treatment of the Plants after their Flowering.—They should be cut down closely, in order to concentrate the sap in the lower part of the plant, and to keep it as low as possible, because in such condition it produces most seed, and is more attractive than a tall ill-furnished plant; besides, this operation tends to prolong its existence. July and August are the proper months for using the knife for the above purpose, but two or three eyes should be left upon the branches of the same year's growth, for the buds are seldom vigorous on old wood. The plants, when thus cut down, should be placed in rows in a very airy place, and exposed to the sun to promote the new budding; some cultivators put them in a greenhouse, or under a frame, until the new shoots are well advanced, and then pot them; but others say that the spring is the only proper season for doing that, for they consider that the second changing prevents the plants from taking sufficient root in the pots, and causes them to grow too high during the winter.

(*To be continued.*)

* Gard. Chron., June 15th, 1844, p. 390.

THE TANK SYSTEM OF HEATING.

As many are, no doubt, contemplating the adoption of the tank system of heating, and as various materials and modes of construction have been suggested, I will give a description of some pits, a hothouse, and vinery which I have erected, and which, so far as I am enabled to judge from six months' experience, viz. from the beginning of November to the beginning of May, answer perfectly.

Not having been quite satisfied with any material for tanks which I had seen or heard of, I resolved on trying the experiment of forming the gutters or tanks for the hothouse and vinery of pottery of some sort. My notion was, that the heat would be given out quickly—abundantly—containing more moisture than that from iron pipes—and that a greater surface would be obtained at much less cost. The ordinary tiles involved numerous joints, which, of course, increased the risk of leakage.

I got a potter in this neighbourhood to make some moulds, and ascertain the greatest lengths in which he could form the gutters, so that they could be dried and burned without any material deviation from their original form. He found that he could not conveniently make them in lengths exceeding 15 or 16 inches. The order was not given till September, when it was too late to dry the clay, when formed, in the sun; the pieces were therefore kiln-dried, and were not nearly so true and perfect as they might have been if made early in the summer, and regularly dried in the open air. However, under all the disadvantages in the construction and putting together, attending a first experiment, the success has been complete, with the aid of a thin coating of Roman cement, which I am satisfied would have been unnecessary if I could have induced the labouring man who put the troughs together to have worked the ordinary cement I had provided to a proper degree of fineness.

Section of Hothouse.

Section of Pit.

Sluice for Pit.

The accompanying ground-plan and section of the house and pits will show the mode of construction. It will be seen that there is a partition across the house, dividing off about one-third nearest to the boiler as a hothouse, which can easily be kept at a much higher temperature, when required, than the remainder of the range, which is intended for a vinery. The circulation may be confined to that exclusively, or suffered to extend throughout the range for a longer or shorter period, as may be desired. Under the paved walk in the hothouse, a reservoir is formed in brick and cemented, into which all the rain which falls on the roof of the house is collected. A moveable pump is inserted in one end, through a hole cut in the stone, for raising the water for use in the house. The gutters are 15 inches wide, and 5 inches deep, and formed in 15-inch lengths—simple open troughs, as shown in the section, excepting at the angles, where there are three pieces, one for each angle, formed in a different mould, there being no joint at the angles, and the two end pieces, which are formed with projecting collars to receive the pipes from the boiler. The gutters are covered with tiles $1\frac{1}{4}$ inch in thickness.

It was, at first, intended to form the house in three divisions, and the gutters were laid accordingly. It will be seen that the flow and return-gutters are connected at two points, in order that the circulation may be confined between either and the boiler. At these points the gutters are covered by a wooden frame, instead of a tile, in which is fixed a moveable cover, which exposes the plugs, by means of which the circulation is diverted across the house, or extended at pleasure, along the entire range. If it is desired to confine the circulation to the stove, the plugs at (1) are inserted and those at (2) withdrawn.

On reference to the section of the house it will be seen that the back wall is carried down considerably under the level of the ground, to admit of a bed of earth on the inside about 4 feet deep; then comes the reservoir, about 3 feet deep, 3 wide, and 16 in length, covered by pavement. The earth on which the gutters are placed has not been moved; but in order to make it level and firm it was covered with a thin coat of concrete. At every 15 inches, where the joints occur, they are laid on two bricks, in order that the under as well as the upper surface should radiate heat; every foot run of gutter presents a surface of 40 inches radiating heat. The potter can deliver these gutters and covers, at some distance from the pottery, at 1*s.* 6*d.* per foot run; whereas, an iron pipe, with a 4-inch bore, which affords but 12 inches of radiating surface, I believe is usually sold at 1*s.* per foot at the factory.

There are two slate tables the whole length of the house, with room for the gardener to walk between them, to hold the plants, which it is expected will do very well even in the vinery, as there are front sashes, and the Vines will be confined to the rafters in the roof. One table rests on one side on the front wall, and on iron legs on the other; the other table is supported entirely by iron legs lying close against the gutters. By this arrangement the gutters are secured against being broken or disturbed by any chance accident.

The boiler is of copper, having a pipe at the top through which the hot water rises, with a cross pipe having two cocks in it, with a brass union on each side at the bottom, to receive the return pipes; so that the circulation may be carried on throughout the house and the pits at the same time, or confined to either at pleasure by means of the two cocks in the upper pipe.

This is a double cylindrical boiler, and I cannot recommend them. I would advise any one to have a single cylinder, and, if made of copper, to see that it is made of ample thickness, and to pay an additional price if need be. I would have those who contemplate what they may deem economy in this respect, suppose they have a house full of valuable plants, and all the pits at work in January, with 10 degrees of frost, when, on a sudden, the boiler leaks and puts the fire out. This happened to me within two months after my boiler was put up—fortunately when the weather was mild, and before the house and pits were stocked. The maker alleged that this could not have occurred by fair work. It so chanced that the boiler had not been put to the performance of more than one third of the work it was sent to me to perform, and it turned out, on examination, that the copper was so thin as not to stand the action of fire for many weeks: this is not a single instance.

The construction of the pits is as follows:—The floor is formed of bricks, laid flat on a bed of concrete, and set in cement. The tanks are then formed by carrying tiles made of pottery, $1\frac{1}{4}$ inch thick, and 5 inches deep, round the outer edge, and on the top of the brick floor, a double row being carried along the centre, to support the covering tiles, which form a floor and return tanks about 2 feet 6 inches wide. These are covered with tiles, the same as the gutters in the house, upon which the earth rests. It will be seen, on reference to the section of the pits, that the front tank is finished so as to leave a space of about 3 inches between it and the front wall. Slate slabs, 2 feet 6 inches deep, rest on the tank to keep up the earth; and at every 5 or 6 feet, where the joints in the slabs occur, there is a single brick carried up between the joints and the front wall, to support the slabs against the pressure of the earth. The object of this, and also of round pipes of pottery, which rest on the surface of the tanks at (*o*), and pass up through the earth, is to furnish dry heat, and to promote a free circulation on the surface, which is found advantageous for propagating. At the points marked (8) are similar pipes, which pass through the tiles covering the tank, which are formed with an opening for the purpose into the tanks; these are fitted at the top with wooden plugs, for the purpose of steaming the pits when requisite.

If it is required that the circulation should be confined to the 1st or 2nd pit nearest the boiler, the sluices (3) are closed, and those at (4) are opened. These sluices are formed by a metallic frame being substituted for the tile at those points, in which a small metallic door works on a spindle. This is attached to a rod, passing up through the earth, having a handle at the top just above the earth. I see nothing to prevent these gutters and tanks lasting sound for ever, and they undoubtedly heat a very considerable area at a very small first cost. The boiler for such a purpose is the only source of anxiety; the only safe course is to have a spare one always at hand, to replace at once that in work in case of an accident. This may easily be contrived so that one boiler may be removed without the loss of more water than chances to be in it at the moment. The pipes may be readily stopped, either by cocks or pluge, so that the hot water in the gutters and tanks may be kept in them, while the defective boiler is replaced by another, and thus no sensible check would occur. I may add that in the winter, when the thermometer stood at 23°, there was a bottom heat of 90°, and of 80° on the surface of the pit then in action, and of 73° in the stove.—*C. L., Cirencester.*

Home Correspondence.

The Chiswick Exhibition and the Judges.—The number and splendour of the company who crowded the Gardens of the Horticultural Society on the 15th, was truly a source of gratification to a reflective mind. The very notion that such a company could be drawn together by anything the peaceful pursuits of Horticulture could possibly produce, could not even have gained credence a few years back, when red coats, the sound of the drum, the prance of the war-horse, and the glitter of military equipment, absorbed the public attention. However gratifying all this may be, and certainly is, there were some symptoms in the Exhibition itself last Saturday, calculated to awaken painful reflections, although there were many splendid things there. It is worthy of consideration by wiser heads than mine, what causes or circumstances contributed to deprive the Society and the public of so many exhibitors of large collections. Whatever my own guesses and conjectures may be, there is only one circumstance to which I beg to call attention. It relates to the judges; and I am reminded of it by happening to meet two or three friends, in returning from a Horticultural Show only yesterday. I was told that among the exhibitors of collections of Heaths at the

Gardens last Saturday, the judges awarded the *second* medal offered by the Society, to what they considered the *first* or *best* collection. Now, I am quite aware of the difficulties conscientious men have to encounter in acting as judges, notwithstanding their instructions, and the latitude of discretion allowed them. Having many times acted in that capacity both at Chiswick and elsewhere, I have not escaped the fate of most, in having my judgment (such as it is) criticised and impugned; but in the above case I have no hesitation in saying the judges (whoever they were, and I am sure I do not know), were decidedly wrong. If the Society offers a series of medals for a series of collections, say of Heaths or Pelargoniums, I cannot conceive it to be within the discretion of any judges to give the *secondary* medal to the *best collection present*, however far that may fall short of their ideal notion of perfection. In such a case I think it the bounden duty of the judges to award the *highest medal* the Society offers to the best collection there present before them; their discretion by no means extending to alter and set aside the proffered rewards of the Society. In so doing, they exceed their duty, mortify and disappoint the exhibitor, and do an injury to the Society, which every well-wisher to its interests must deplore and condemn. In course of practice in these matters, I have seen subjects exhibited the worth of which were so far below what the Society offers for things of the same name and kind, that we felt it a duty to pass them over altogether, but such could not happen with collections of Heaths; and I deeply regret the Society should suffer injury, or its Exhibitions be deteriorated, by any such instances of overstrained discretion (indiscretion?) I leave this for your cogitation, being an ardent well-wisher to the Society.—*One of the Judges* (*not of Heaths*). [As our correspondent is one of the judges, he must be aware of three things—1. That "the judges have the power of *increasing* or *diminishing* the number and value of the silver medals offered by the Society for particular objects, and also of *conferring* silver medals or certificates in cases not contemplated in the regulations, if they think it necessary to do so." And also "of not making any award in cases where the objects exhibited do not appear worthy of a medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it." 2. That whenever the judges propose to withhold a medal, the Society's officer, who registers the award, invariably begs them to consider again whether they are quite justified in doing so, he, at the same time, pointing out that such a regulation should not be put in force except on very sufficient grounds, and that they should always act on the side of liberality. 3. That the Society never disturbs an award after it has been made.——We state this much on behalf of the Society. For ourselves, we are clearly of opinion that withholding medals, except on very sufficient grounds, is unfair to the exhibitors, injurious to the exhibitions, and entirely contrary to the intentions of the Society. The absence of large collections is owing to the new regulation, which prevents Azaleas, Cacti, Heaths, and such things being included in them. This rule was made under the impression that it would improve the appearance of the large collections; but it is clear that exhibitors cannot, in general, comply with it, and we have no doubt that it will be altered another year.]

Morphology.—Those who oppose the doctrine of Morphology, are constantly referring to instances of monstrous development in the animal kingdom, as proofs that the so-called vegetable monstrosities are to be regarded merely as being accidental and adventitious, and not, as the Morphologists think, proofs of the real nature of the vegetable development, and exhibiting clearly the manner in which the Creator has willed that each should bring forth "seed after its kind." Among the statements which have been used to decry the doctrine, and those who hold it, none have been so positively insisted upon as being conclusively repulsive to it, as these instances of animal malformation. It seems to have been forgotten that, between the manner of the development of the animal, and that of the vegetable kingdom, there does not exist any analogy: consequently, the deductions drawn from the premises afforded by such instances, have no weight in the argument. We may take as an illustration of the foregoing, that period when the infant creature, and the infant vegetable, become visible and tangible: prior to this period, the consideration may be left on neutral ground, for it does not affect the question. An infant animal is, at the first moment after its birth, if not perfect, at least fully formed; and its subsequent increase in size is not caused by any accession of new parts, but (with a trifling exception) is only a constant scene of distension, or of filling out the various parts of that structure which, at the moment of its birth, was there palpable in every part—a perfect animal being in miniature. It is very different with a new-born vegetable when it bursts from its tenement and is presented to our view; it has not every part of its structure formed: it has, indeed, a root, or the nucleus of one; it has leaves, but these are imperfect, transient, and subservient only to those which follow; and the future existence of this vegetable being is not merely a scene of filling out parts of its structure which are then present and palpable, but of a constant accession of new parts, and of a constant addition of new matter. Such being the case, no instance or arguments connected with animal organisation can be taken as having any relation or bearing on the doctrine of Morphology, which belongs exclusively to the vegetable kingdom. Now, as a plant, when it first springs into existence, has no other visible organs than the root and leaves aforesaid, and as its further growth and increase is in reality mainly a mere addition of organs similar to the latter, each succeeding one becoming more and more developed, and more and more perfect, it must follow that the same source which supplied the materials from which these organs were fashioned, by the inherent force (we may believe) of the mysterious vitality with which the germ was imbued, must also supply the materials from which a series of organs, still more perfect, are eventually moulded, and which have allotted to them the peculiar task of perpetuating their race. Beside this truth, another must be maintained and reiterated—namely, that circumstances are ordained to exercise an influence over the development of plants; and that, when a sufficient age and maturity is attained, the nature of that development does change according to the nature of the circumstances which affect it.—*T. Moore.*

Morphology.—Morphology has certainly good arguments in its favour; but some of its propositions are so startling, that mature consideration is requisite before yielding an assent to them. That stem, branch, bract, flower, and fruit, are but metamorphosed leaves is the leading doctrine of Morphologists; but, I would ask, why of leaves? May not leaves with equal propriety be said to be modifications of the stem or the flower? No doubt the leaf is a most important organ, and performs most useful functions in the vegetable economy; but does not the flower present a more advanced stage of organisation, and is not the fruit the most perfect of all? Would it not be a much better mode of stating the doctrine, to say that stem, branches, leaves, flower, and fruit, are essentially the same in structure and composition, but varied and modified in their outward form and appearance? Few would, I think, object to this phraseology. Any one acquainted with the subject of Vegetable Chemistry would agree to it without much hesitation; and I contend that the above proposition would embody the whole of the much-vaunted doctrines of Morphology. But when we hear flowers called "imperfect leaves," or fruit "stunted branches," is it not natural to regard such terms as unscrupulous and unphilosophical? No doubt florists can sometimes, by varying their mode of treatment, cause plants to grow to flowers or branches—to wood or fruit—according to wish; but then, this is by using artificial means. In a natural state, the various organs of a plant will be found occupying their allotted and constant situations; and if, as in the case of the Pæony, instanced by "R. E.," there is a progressive change from the lowermost leaf to the very pistil, are not these but the nice and beautiful gradations which Nature, always hating sudden transformations, employs in all her works?—*Dendrophilus.* [The reason why leaves are taken as the types of all the other organs is, that they are first formed, appear in a perfect state before any other part, evidently change into the other organs, which themselves are reconverted into ordinary leaves in the presence of any disturbing cause of sufficient power. The artificial means employed by florists are only an imitation of the ordinary means put in action by Nature, when transformations are produced.]

Budding.—I have generally used adhesive plaister cut into strips about a quarter of an inch wide, to secure the bud in its place, and I consider it far better than either bast or worsted, as it not only keeps out the air perfectly, but is less likely to cut into the stock. It is equally eligible for grafting; I have grafts inserted this spring, and secured by the plaister, having the union of the bark with that of the stock so accurate as not to be seen but by a careful inspection.—*Lusor.*

Labelling.—In reference to labelling Roses, (see "Rose Garden," p. 372.) I beg to recommend the following plan for securing neatness in the stamping. I have a piece of iron plate 8 inches long, 2 wide, and $\frac{1}{4}$ thick; upon this is another the same length, 1 inch wide, and $\frac{1}{8}$ thick, fixed by a screw at each end, so as to cover half the width of the other plate. I introduce the lead I wish to stamp between the two plates, and fix it firmly by tightening the screws. I then apply the letter-punches to the edge of the thin plate, and punch upon the thick one, which gives me a true line. The operation will be understood

by reference to the accompanying woodcut. I have found it an improvement to bevel off the edge of the thin plate—as shown in the cut—to about $\frac{1}{10}$ of an inch. I consider Wetterstedt's marine metal better than lead—being thinner, and, of course, lighter.—*W.*

Gooseberry Caterpillars.—I have for the last three seasons (this year excepted) adopted the method of picking off the eggs of these before they are hatched, or immediately afterwards. This plan is both simple and effectual, and is not expensive when the person who does it becomes accustomed to the work. The garden under my care contains between three and four acres; all round the borders and two squares are planted with Gooseberry bushes. The first year I gave a boy a halfpenny per dozen for leaves containing eggs, or caterpillars just hatched, before any of them had left the leaf. The whole sum given to the boy during the season amounted to about 7*s.* 6*d.* Last year I gave the boys employed in the garden 6*s.* for keeping it free from caterpillars, and this they did successfully. This year I have not seen a dozen all over the garden up to the present time. If gardeners will follow this plan they will have no reason to regret the experiment. The garden here had hitherto been much infested with caterpillars, which, in some years, stripped the trees of nearly every leaf.—*A.K.*

Whitney's Composition.—Last winter I procured a quantity of calico and book-muslin, which was prepared strictly in accordance with Mr. Whitney's printed directions. On applying the fluid, however, it did not cover near the extent of surface it was said to do, although all the minutiæ were fully attended to. When the flower-buds on my peach-trees began to expand, the most promising trees were shaded with this material, others being covered with netting only. As the season advanced, the foliage of those protected by Mr. Whitney's material showed signs of blister, and the evil continued to increase until the shading was removed; while those protected by the netting were wholly uninjured. The quantity of fruit in each case is about equal. Those that were under the waterproof material are perhaps a little in advance, but the difference is not great. Book-muslin admits more light than calico, but is very unsuitable in exposed situations. Its texture does not stand the pressure of wind, although very carefully secured to the frames. An amateur in this neighbourhood has this season prepared calico for growing cucumbers, according to a prescription by "Devoniensis. This is equally waterproof, quite as transparent as that of Whitney, and not half so expensive, which is of some consequence. A few of his fruit measure 20 inches in length, and the plants are healthy and vigorous.—*Alex. Cramb, Heywood House.* —Another correspondent, whose name we have, writes thus:—"I, with others, find that Mr. Whitney's Composition does not go so far as he says it will; 60 feet take a quart, and much care."—*W.*

Pansies.—This being the proper time to plant out Pansies, cuttings of which were put in under hand-glasses in April, and are now fit for bedding out, I beg to give the following particulars as to their successful cultivation. Prepare a bed to the depth of two feet with loam, cow-dung, and road-sand; place the plants 18 inches apart every way; coat the bed all over with cow-dung one inch in thickness, to prevent it appearing unsightly; cover it over with fine sifted road-sand, which will cause it to have a neat appearance, and the sharp gritty particles will also protect the plants from snails, slugs, &c., as they have a great aversion to crawl over rough uneven surfaces; the above composition will cause the plants to grow moderately and bloom finely, and the coating of cow-dung will prevent the necessity of watering during the hottest weather.—*J. R., Woolwich.*

Strawberries.—My practice in the cultivation of these is neither novel nor peculiarly valuable, but it has certainly been abundantly successful, and might possibly, as far as it goes, assist in settling the question of the annual renewal of this valuable and highly esteemed fruit. My plan, then, is as follows:—I peg down the runners as early as possible, taking care to cut off all the superfluous ones as they appear. By the first week in July, at the latest, I plant them out at 18 inches between the rows, and only one foot from plant to plant. I prepare my bed by deep trenching, and manure it abundantly with good frame dung, mixed with the rakings of the borders, mowings of the lawns, refuse vegetables—in short, with litter of all sorts, and then well saturate the heap with gas-water. The result of this practice this year was, and continues still to be, as follows:—My bed was under a south-east wall, and divided equally between Keen's Seedlings and the British Queen; the length is 100 feet, the breadth is 9 feet. I began to gather most excellent fruit on the 23d of May, and on that day picked a quart of Keen's Seedlings, and from that time to this, I have gathered more than 2½ bushels, the Seedlings being nearly exhausted, but the Queens promising a more lengthened duration. I have to add, that they have, notwithstanding the dryness of the season, been watered but three times, but then they were deluged, and that every week I regularly took off all runners. The fruit of both sorts was the finest I ever saw, and that not by culled samples, but universally over the beds. These were planted runners last year, and put in the first week in July.—*J. Vaux, Northfield, Ryde.*

Asparagus.—I tried salting Asparagus-beds two years ago, and each year the beds were worse and worse, and now that I am digging them up, the earth turns up in large lumps as adhesive as glue; the roots are in pools of water, and of course nearly rotten. This is not the fault of the soil or subsoil, the former having the advantage of 28 years' indefatigable care, and the latter a rather tenacious brick earth.—*J. Vaux, Northfield, Ryde.* [Our correspondent may rely upon it his mode of applying the salt, or some other cause, has done the mischief. All evidence goes to prove the great value of salt to Asparagus.]——"Este" begs to say that, following the advice in the *Gardeners' Chronicle*, he applied salt to his Asparagus beds, each 14 square yards, nine in number, 2 lbs. to the yard; 1843 was a cold and wet spring; his produce was greater and finer than ever. This year he followed the same plan, the spring dry and frequently hot; the produce greater and better than last year. Thanks, and many, to the sound sense of the *Gardeners' Chronicle.*

Bees.—Your correspondent, Mr. Grant, complains of what he styles remarks tending to ridicule his communications. I acknowledge that, on reading in the *Gardeners' Chronicle*, some of the communications on the subject of bees, my feelings have been aroused; and I agree with the observation made by a recent writer on "Substances in Manures," who observes, "that

parties ought to be more particular, and not take it for granted that all who read their remarks are blockheads." Mr. Grant has favoured us with an extract from Bonner, (a good practical bee-keeper,) explanatory of the way he used the terms sleep or repose, officer bees or scouts, bees on guard, &c. I am now satisfied, and hope that other bee-keepers will be so to. I just take leave to remind Mr. Grant, that Bonner states "that bees were eager of work during the day, and sing for joy through the night; that they labour with great assiduity and constancy." And you, Mr. Editor, will please to recollect that Horace says, that "ridicule was more efficacious in deciding disputes of importance, than all the severity of argument." And Shaftesbury went further: he states that "ridicule is the test of truth."—*Mel.* [There is no doubt that if disputes can stand the test of ridicule, they have a great argument in their favour; but ridicule is, for all that, a weapon that should be used discreetly. Weak-minded people will abandon the best cause, merely because they cannot bear to be laughed at.]

Sleep of Bees.—My attention was lately called to the sleep of Bees by Mr. Grant's remarks at p. 334. I agree with him that bees are at times not so industrious as we think they might be, but I cannot go so far as to blame them for being sleepy and indolent in good weather, only working six hours in a day. I am aware that some apiarians are of a different opinion—they imagine that bees after toil take a nap, but I think that few believe they loiter away six hours at a time in good weather. But as Mr. G. made his observations at the apiary, I shall state what he says respecting the idle bee:—"I have come to this conclusion from repeated observation, that in proportion to the number of bees leaving the centre hive or side box, at the early hour of five o'clock in the morning, nearly an equal number came in the side box to repose at eleven o'clock, a.m., and those that left at later hours in the morning ceased from their field labours at intervals of about six hours during the day. Those that had returned from labour could easily be distinguished from the others that had been out, as the former occupied particular positions until those that were asleep wakened, and vacated their places to go on duty, and then the others might be seen taking up their positions, and in a short time afterwards were fast asleep." I consider that the bees entered the side box not to sleep, but to commence comb-building; why they did not begin sooner in the day was owing to the low temperature of the hive. As the day advanced the heat of the hive increased, and the bees returning with their loads, which were soon deposited, they again returned to the fields without taking a six hours' nap, or perhaps joining in the cluster to appearance lulled, though busy within. Has any one ever observed bees which had just been in the fields, powdered with pollen, hanging in a cluster? No, they may be seen issuing from the hive almost as "mealy" as when they entered. There is a time, however, when pollen or farina bees are in a bustling cluster; I mean when a swarm is mustering for their exit from the stock; but they are only stragglers which happen to mingle with the swarm, especially if it is the first one. This favours my belief that bees are hardly aware of the exact time the queen will quit, and that they often seem more anxious to be gone than the watchful queen. Though true, I question whether Mr. Grant's remarks on ventilation will please some of our apiarians now-a-days. I can hardly lean to his views of the clustering of bees outside the hive "not being any loss whatever to bee-keepers." There is a time, however, and perhaps the only one, when this may be applied; it is when bees are about to swarm; though room is given, idleness often prevails inside. But in general, clustering outside the hive must be a loss, for when room is given they often begin fresh combs, and of course store up honey without being driven to it by bees who "never work themselves." It may be worthy of remark, that moralists may have extolled the industry of bees too much, and some apiarians too little. But let it be borne in mind that they were originally "exotics," and it is only under the influence of a warm climate that their real habits can be rightly understood. —*J. Wighton.*

Bee-flowers.—I find that bees are very fond of the following shrubs and flowers:—For winter feeding—Erica carnea, Crocuses of sorts, winter Aconite, Berberis repens and Aquifolium, Ribes sanguineum. For spring feeding—Papaver Cambricum (the yellow Poppy) is the best, Berberis vulgaris and Empetrifolia, Helianthemums. For summer feeding—The annual Poppies are the best, Sea-kale flowers are very good, as are those of Fraxinellas, Phyteuma orbiculare, Asters, and hardy Heaths. —*F. X. O.*——In a late Number, at p. 334, "Apius" gives a list of flowers, of which, he says, bees are very fond. There are few plants that bees visit oftener than Sea-kale, Phacelia tanacetifolia, and common pot-herbs. The Phacelia is a particular favourite with them, and should be grown in great quantities where bees are kept. It is ornamental, and thrives well in any waste ground. Sea-kale should also be grown for the same purpose.—*J. O. C.*

Peas.—On the 14th Feb. last I made sowings, side by side, of rows of the Prince Albert Pea, Early Warwick, and Shilling's Early Grotto. From the first of these I had a gathering on the 5th inst. as forward as some of the Warwick which were sown under a wall in December last; the others are not yet (June 11) ready. The Prince Albert has proved, however, with me a very shy bearer, and I should say was a tender Pea.—*Claudio centrouris.*

Prince Albert Strawberry.—This is certainly a very large and prolific Strawberry. I have a dozen of them planted 2 feet apart every way; each plant measures 7 feet in circumference. On one of them I counted the extraordinary number of 256 fruit, and altogether the average is 250; therefore, the plants have on them at this present time the amazing number of 3000 fruit, all formed, and in different stages of growth—some very large and ripe. The plants are still in full flower; they are growing in well-manured sandy loam.—*Cantium.*

The Pear-tree.—The Pear-tree, although possessing, as it does, a most vigorous constitution, and accommodating itself to almost any kind of soil, is, nevertheless, frequently unproductive, whether it is grown as a standard, and allowed to assume its natural habit, or under artificial training, but more especially in the latter case, in which the extreme points of the branches only produce fruit. Young Pear-trees, under any state of cultivation, seldom bear abundantly, and in many instances the planter has to wait, perhaps a dozen years, before his labours are rewarded by even a moderate crop of fruit. Luxuriance of growth is supposed to be the cause of this deficiency; and this has led me to consider how the superabundant sap might be directed to the forming of fruit, instead of producing useless branches. All gardeners are aware that at the base of the shoots forming what is termed breast-wood, there are leaf-buds which seem to want the requisite quantity of sap to produce blossom-buds; and it occurred to me that the breast-wood robbed these buds, and that it was therefore necessary to direct the sap to them, and thereby increase the number of fruit-buds, which is the great end to be obtained. My plan for effecting this, is as follows:—Supposing, in the first instance, that the tree has been pruned and fastened to the wall in March, which is about the usual time for the operation, in summer-pruning, I go over the trees, stopping merely the breast-wood at six, nine, or twelve inches, according to the strength of the shoots, but taking care not to cut closer than six inches. Any shoots they may make after that time, I again stop within a few inches of the first cutting. This is done merely to give the tree a neat appearance: in autumn, when the trees are to be fastened to the wall, I proceed with that operation without cutting off anything except dead wood from the tree, deferring the pruning to the following April, or first week in May, when the tree shall have formed leaves. I then go over it, cutting the breast-wood close into the spurs, so as not to leave any buds to conduct the sap or form breast-wood. The system of the tree having been thus changed, it produces little useless wood; but, should it occasionally do so, the same system of pruning should be persevered in, and it will be followed by good results. I have practised this plan for some years, both with young and old Pear-trees, and have been uniformly successful, particularly in the case of old trees of perhaps forty years' growth, that had spread upwards of eight yards on each side of the trunk, and which, previous to this mode of pruning, produced but few fruit, and those only over a surface of about four feet from the extreme points of the branches, whilst they now bear good fruit uniformly all over the tree. Younger trees have sometimes produced fruit, even on the perpendicular stem from which the branches spring. It must, however, be observed, that my remarks are confined to Pear-trees that are vigorous and healthy. Diseased trees require to be made healthy before they can be treated in the foregoing manner. The varieties that have come under my management are the Chaumontel, Beurré Rance, Easter Beurré, Marie-Louise, Napoleon, Gansel's Bergamotte, Autumn Bergamot, Glout Morceau, Beurré Bosc, White Doyenné, Spanish Bon Chrétien, Wilding of Caissoy, and some others, all of which have been treated nearly alike, as far as the habit of the trees would permit, which must be left, in all cases, to the judgment and skill of the gardener.—*Observer.*

Boilers.—In reply to a correspondent who complains about the expense of boilers for temporary forcing, I beg to mention that if he lives in the neighbourhood of a potter, and would get him to make an earthen boiler, the earth prior to making being well kneaded with a saturated solution of sulphate of alum, it would stand any amount of heat, and would not cost more than 3*s.* or 4*s.*—*Jacob Green.*——I often hear complaints made of the expensiveness of boilers for heating pits and small greenhouses. Would not Papin's Digesters make very good boilers, by inserting a pipe where the valve is? They may be procured at a very moderate price.—*Empty.*

Potter's Liquid Guano.—About two months ago I communicated some practical and important results from the use of Potter's Liquid Guano, which during the spring I applied to a large variety of flowers, plants, and bulbs, in pots, and in glasses (see p. 261). My remarks were quoted by Mr. Potter in his Advertisements, and thereby they have obtained a wide publicity. In reference thereto, I have been asked to state further, "What was the effect produced by the guano on the plants after the very beautiful flowers they had borne had done blooming?" Some are of opinion that the roots were of necessity enervated, and unfit for further bearing. At all events, they imagine that the productive powers of the roots were very considerably impaired. This, as far as my own observation extends (and I have severely tested the matter by oft-repeated experiments), is totally at variance with fact. The roots and leaves improve wonderfully, both in substance and health; so much so that the fertilising nature of the guano is apparent to every observer. It is not the quantity used that effects this, but the regular and moderate application of it in weak solution. My Strawberry plants in particular confirm what I have now stated; and next season I expect to be fully rewarded for the pains I have taken with them, by a rich harvest of fruit. As for my Roses and flowers generally, their colours, fragrance, and beauty, speak far more eloquently for the liquid guano than any set terms of praise.—*William Kidd, New Road, Hammersmith.*

Humphreys's Compound.—Having observed an attack on this article in the *Chronicle* of last week, I would claim the privilege of a reply, in justice to myself and to the public. In his first sentence, "F. R." speaks of "having been informed that this Compound is little else than nitrate of soda and common salt." My answer to this insinuation is, that not a single particle of either the nitrate of soda or of common salt is used in the Compound. Resting on the above false statement, he proceeds to say, that he "could not understand how anything resembling guano could be made from it;" and by way of an authority states that he "got a chemical friend to examine it; and he informs me (he writes) that he cannot discover a trace of phosphate of lime in it." Now it so happens that the phosphate of lime is insoluble in water, so that to expect to find it in an article advertised as a soluble compound to make what is called a "liquid guano" is an absurdity. That the phosphate of lime in guano is most useful for Corn, everybody admits; but the phosphoric acid in this article is introduced under a form of far more general application. The fertilising influence of guano is known to depend, to a great extent, on the proportion of ammonia it contains; and if the reader will mix a little powdered quicklime with a teaspoonful of the Compound, as a chemical test, the pungent ammoniacal odour evolved will at once convince him of its parallel character and condensed power as a manure rich in nitrogen.—*J. D. Humphreys, John-st., Pentonville.*

Societies.

LINNEAN SOCIETY.

Tuesday, June 18.—THE BISHOP OF NORWICH in the Chair.—Professor Edward Forbes exhibited specimens of Cynomorium coccineum, procured by Colonel Bailey from the island of Gozo.—A specimen of Orobanche caryophyllacea, found growing on the roots of Galium mollugo, near Folkestone, was exhibited by Mr. Richard Taylor, to whom it had been sent by Messrs. C. C. Babington, W. Francis, and A. Henfrey, now on a botanical tour in Kent.—Drawings of an unnamed parasite belonging to the genus Anopleura, and found upon the Ornithorhynchus, were exhibited by Mr. Jas. Dixon, surgeon.—Fruits of the Juglans nigra and Quercus macrocarpa were exhibited, presented to the museum by G. Charlwood, Esq.—A paper was read by Mr. Edward Solly on the solid vegetable oils. These oils were characterised by possessing stearine, the solid principle of all oils, in such quantity as to render them solid at the ordinary temperatures of the atmosphere. They were of the consistence of animal fats, and in many instances were used as substitutes for the fat of animals in the making of candles, and as substitutes for butter, as articles of diet. There was some difficulty in distinguishing these oils from wax; but the latter was produced in much less quantities. The various plants yielding solid oils were pointed out, with the modes of obtaining the oils, and the uses to which they were subservient in the various parts of the world. Few or no British plants yield solid oils. The plants yielding butter, tallow, and solid oils which were mentioned are as follow:—Theobroma Cacao, Chocolate nut-tree, yielding Cacao butter; Vateria Indica, producing a solid semicrystalline fat, used for various purposes in India, where the tree is called Tallow-tree; Pentadesma butyracea, the Butter or Tallow-tree of Sierra Leone. Several species of plants belonging to the natural order Lauraceæ, as Laurus nobilis, Tetranthera sebifera or Litsea sebifera, Laurus cinnamomum, &c., yield solid oils, in addition to their volatile fluid oils. The Myristica moschata, the common Nutmeg, with the M. sebifera, both yield a solid oil, sometimes called Nutmeg Butter; Bassia butyracea, the Mahva or Madhuca-tree, gives out a kind of butter which is used in India. The Butter-tree of Mungo Park, found in Africa, is the Bassia Parkii of some writers, though others have doubted if the Butter-tree of Park is a Bassia at all. The butter is also called Shea butter, and specimens were exhibited procured by Dr. Stanger during the late Niger expedition. Several Palms yield solid oils, the principal of these are the Cocos nucifera Cocoa nut-tree, and the Elæis guineensis; the former yields the Cocoa-nut oil and butter; the latter, the Palm-oil of commerce. All the fruits, however, of Palmaceæ are capable of yielding more or less solid oil, and many other species than those named yield the Palm-oil of commerce.—A paper was read from Mr. Curtis, on the economy of the order Strepsiptera. During the spring the author had found upon the female of a species of Anaræna, a number of larvæ excessively minute, so much so that there was at least a thousand on the body of the larger insect. These were accurately described, and the author believed that they were no other than the larvæ of a species of Stylops, but he was prevented watching their development by their destruction, arising from their being kept in a box with camphor.—A third paper was read from Dr. Hemming, on the anatomy of the muscles which move the peacock's tail. This paper was accompanied by beautiful drawings.—Dr. Balfour, Professor of Botany in the University of Glasgow, was elected a fellow.—Messrs. Ross, Powell, and Varley exhibited their microscopes, with examples of vegetable circulation in Nitella, Valisneria, Tradescantia, Hydrocharis, &c.—Mr. Ogilby exhibited a specimen of Prangos pabularia, which had grown and flowered in Ireland.

MICROSCOPICAL SOCIETY.

Wednesday, June 19.—Dr. Goodfellow in the chair. Mr. Edwin Quekett read a paper on vegetable substances vomited from the stomach of a human being. Previous to giving an account of the case in which the author had observed this phenomenon, he gave an account of the various instances in which vegetable growths had appeared to be a source of disease in the human body as well as in the lower animals. Fungi had been found growing on gold-fish, sticklebacks, &c. &c. Mr. Goodsir had related a case in which a species of Alga was thrown from the stomach with the vomited fluid. In the present case the person had been ill with diseased liver for a great length of time, and was incessantly vomiting a fluid which contained a great number of cells, having the external form and character of the Torula Cerevisiæ. When the fluid was set aside fermentation went on, with the escape of carbonic acid, in the same manner as in the ordinary process of fermentation. Nothing that had been prescribed had afforded any relief to the patient. The paper was illustrated with drawings of the Algæ vomited in this case, as well as of the various forms of fungi and Algæ that had hitherto been detected as producing diseases upon animals. The chairman pointed out the value of this contribution in a pathological point of view, and as illustrative of the value of the microscope.—Dr. Lankester referred to the development of fungi on the bodies of flies, as also the supposed vegetable origin of tubercles in the lungs. He was not prepared to admit that these cells were either plants or animals; they were evidently the product of organisation.—Dr. Wright, of Cheltenham, thought that such cases as this ought to lead us to be careful in adopting the dogma "Omne vivum ex ovo." This observation led to a discussion on the nature of spontaneous generation, in which Mr. Varley, Dr. Wright, and Mr. R. H. Solly, took part.

Reviews.

Knight's Weekly Volume. No. 1.

We cannot allow the week to pass without mentioning the appearance of this proposed Periodical, notwithstanding that its objects are those of General Literature. Mr. Knight proposes to issue one volume weekly, at the price of a shilling, in the hope of presenting persons of small means with the opportunity of perusing the best and most healthy part of our national authors. The attempt is a noble one, and deserves to be supported by every one who has at heart the welfare of his country; for by this means, more surely than by any other, will the pernicious rubbish that now circulates so largely, because of its cheapness, be removed.

The volume before us, the "Life of Caxton," is a most interesting history of printing. It is six inches long, four inches wide, has 240 pages, contains a great quantity of woodcuts, and *is sold for one shilling*. Who is there who would not try to save a shilling a week for such a periodical as this?

A Description of the Newly Invented Bar and Frame Hive, or Miniature Apiary. By W. A. Munn, Esq. 8vo. Van Voorst. Pp. 52.

The opinions of Bee-keepers respecting the merits of hives are so conflicting, that we cannot pretend to settle them. The arguments of Counsel in the great case of Wood *v.* Straw have been occupying the Courts for years, and seem as far as ever from being terminated. We, therefore, recommend the earnest bee-keeper to leave Counsel to themselves, and to betake himself to the superior Court of Experience.

As a guide to his road thither, he will find this sensible pamphlet useful; for the author evidently understands his subject, and seems little biassed by prejudice. We doubt, however, whether his plan of moving bees from place to place in search of food can ever be carried into practice in a country like this. The hive, which it is Mr. Munn's object to describe, has already been mentioned, with a woodcut, at p. 317 of our volume for 1843, to which place we refer our readers. It is only necessary to add that there appear to be considerable advantages in the use of the Bar and Frame Hive, and that it seems well worth a trial. How to manage it, will be fully learnt from Mr. Munn's pamphlet.

Miscellaneous.

Note upon a way of Grafting, so as to accelerate Bearing, by M. Lecoq, Gardener to the Royal Society of Horticulture.—People are surprised that fruit-trees are not so frequently raised from seeds as they ought to be. There is no doubt that the scarcity of attempts of this kind is to be attributed to the great lapse of time that is required to judge of the result. Indeed, for an amateur or for a gardener to wait from 10 to 15 years is enough to discourage them. Nevertheless, I think I have found a way of shortening this long space of time, and I wish to communicate the means that I have employed for the purpose. I received, in the spring of 1833, a branch of a Pear-tree, without a name, the fruit of which I was assured was excellent, being much like the Saint Germain. I was a nurseryman then, and I would not send out a tree without being quite sure of its fruit; so I then made three scions (in the manner of cleft-grafting) with this branch of the Pear-tree. I chose for the stock three principal branches upon a Quenouille which had been planted about eight years; I shortened these branches to 11 inches from the trunk; I fixed to each branch a graft provided with two eyes, which pushed very well, and each made two shoots 23 to 26 inches long. The next year I pruned my Quenouille as usual, except the branches proceeding from my grafts, which I preserved at full length; I bent them by drawing towards the ground, and brought them as close as possible to the trunk of the tree, where I fixed them: they remained in this state all the year. Each bud, instead of growing into a branch, formed a fruit-spur. The third year I detached my branches, straightened them a little, which permitted the sap to circulate more freely; and that same year I gathered from my three grafts 36 Pears, which I found to be the Pastorale. At the same time that I tried the above experiment, I inserted four other cleft grafts upon some young Quinces; I cut them to one bud the following August: they produced me 32 buds, which I worked with a dormant eye: 29 succeeded, which I sold the year that I was able to judge of the fruit. Cleft-grafting, then, can be employed with success to prove a tree raised from seeds. Only there is the disadvantage of sacrificing a good tree to gain, perhaps, a bad fruit; but those who have old Quenouilles can employ this kind of grafting without making a great sacrifice. Plantations of Apple, or Pear, or Quince-stocks may be prepared in Quenouilles for this purpose. The same branch may be grafted several times. Thus, a branch which has been grafted for the first time, 11 inches from the trunk, can be grafted six times, by cutting 1½ inch off each time that a new graft is placed on. It is to be observed, however, that the stock on which these experiments are made is not intended for a perfect tree, but merely a stock from which one must draw what advantage he can. About five years ago I saw in the Royal kitchen-garden, at Versailles, this kind of grafting practised on a large scale, but with well-known sorts; I never saw such a plentiful crop, but I think that the trees cannot last above two or three years. —*Revue Horticole.*

The third flowering of the Paulownia imperialis.—The father of all the Paulownias, which have now been distributed in such great numbers through the gardens of Europe, has just flowered, for the third time, in the Garden of Plants at Paris; 150 terminal bunches, bearing each 20 to 30 flowers, make the tree appear like a single bouquet of a light blue colour, having the most charming effect. The peduncles are from 15 to 16 inches long.—*Revue Horticole.*

Newspaper Marvels.—In a north country paper there appeared lately the following paragraph:—"Great Marvel.—Scotch Leek.—There was lately pulled in a garden belonging to Mr. Cook, civil engineer, Wooler, a Scotch Leek 9 inches in diameter, breadth of leaf 7¾ inches, and weight 2½ lbs.; in the same place there are several others as large." Had this been true it would have been indeed a prodigious Leek. But as we do not find advantage in taking such wonders upon trust, we wrote upon the subject to Mr. Cook, who has very kindly explained the matter by informing us that we should read *circumference* for *diameter*; which makes a rather considerable difference. A Leek that weighs 2½ lbs. is a fine Leek, for all that.

CALENDAR OF OPERATIONS

For the ensuing Week.

I.—STOVE, CONSERVATORIES, &c.

If you imagine that any of your established stove plants will require another shift this summer, let it be done soon; but avoid shifting large specimens so late, if you can; rather encourage them with a little liquid manure occasionally. Your young plants may be potted as they require it for the next two months. Do not neglect to make cuttings of Justicias, Clerodendrons, and such useful plants, early in July, for flowering next year; these will form beautiful plants before the end of October. Pentas carnea belongs to this class; it is a very useful plant in winter, and may be had in flower all the year round; it is as cheap as Verbenas. Air, moisture, and cleanliness, as usual, are requisite.

Conservatory.—There is no scarcity of flowers here now. The usual routine of training the climbers and keeping the other plants in order, together with neatness, is all that is immediately wanted; but keep a good eye to your winter stock. Camellias that have formed their flower-buds may now be potted; those of them that are to flower early should be kept in doors all summer, but the spring-flowering ones may be turned out soon. Attend to Violets; this has been a hard season for them as well as for Chrysanthemums. The China Rose, called Cramoisie superieure, is the best of them all for winter forcing, and takes the place of the old sanguinea in the bouquets at Christmas. Anna Boleyn Pinks for forcing ought now to be in a forward state; and if they show symptoms of flowering, pinch off the stems as they appear. In short, this is just the proper time to attend diligently to such plants as will flower from October to May.

Greenhouse.—As all but the very best specimens are now removed from this house, you will have room to introduce annuals, placing three or four of them in large pots; with a little care they will come in useful for the Conservatory. Syringe this house every evening now, and keep the paths constantly moist, otherwise you cannot expect a healthy growth.

Pits.—For growing a stock of young plants in summer, no structures are so good or economical as good pits. Place the pots on a bed of sifted coal-ashes, and if you can procure clean Moss, free from slugs, &c.; it is an excellent plan to place a thin layer of it between the pots; after it is well damped, you have a source of constant moisture, which, passing up among the foliage, is very beneficial to all plants in summer, and they require less shading when they are thus managed.—*D. B.*

II.—FLOWER GARDEN AND SHRUBBERIES.

Out-door Department.

We have had upwards of thirty hours of as fine a rain as ever has fallen from the clouds, and the plants which last week were dying, now promise to be regenerated. Calendarial directions are almost unnecessary this week, but a few hints may not be out of place. First, get all bad pieces of turf on the lawn or verges replaced by new, taking care to lay it on *mud*, and when the sun shines brightly, shade it with an old mat until established. Secondly, where the Grass is much parched up, give it a slight dressing of Potter's guano, in the proportion of one bushel of guano to four of light sifted soil. Dress also with the same any of the plants in the beds which may not be growing so well as could be desired. Thirdly, look well to the rolling of the walks, and, above all things, clear all rubbish from bye-corners. Nothing in my opinion looks so bad as corners left dirty, merely because they are not often seen; and there is nothing for which I would sooner call a gardener a "sloven."

Reserve Garden.—Biennials and Perennials have grown indifferently in general this season, therefore make another sowing immediately, especially of Wallflowers, which are indispensable for spring decoration. Sow also Campanulas, Pentstemons, Aquilegias, Antirrhinum, Hollyhocks, &c. Brompton Stocks I never sow before the first week in August, at which time they will be treated of in detail.—*W. P. A.*

III.—FLORISTS' FLOWERS.

Pinks.—The exhibitions of this deservedly favourite flower are rapidly taking place through the country. Complaints are made of their not lacing so well as usual; but this defect is principally with those which have been removed in the spring. We are glad to find that the standard of perfection is assimilating throughout the country, and that something like uniformity of opinion begins to prevail. Those who are anxious to obtain good seed do not leave the impregnation to chance, but assis Nature in the operation. Continue to put in pipings or cuttings; shade and water them occasionally. *Carnations.*—The late showers have had a beneficial effect on these as well as on the other departments of the florist's care; and they are now coming on most favourably. The observation made above, as to planting in the spring, will also apply to the Carnation and Picotee; the detrimental effects of which may be seen in the plants throwing up weak stems almost destitute of "grass" or layers, to the great disappointment and loss of the grower. Continue to disbud, &c., as recommended last week. Put in pipings, &c. If the buds are sufficiently forward tie some waxed thread round to prevent their bursting, twisting the ends together, which will be found a sufficient fastening. *Pansies.*—Shoots may be removed and planted out—the weaker the better. Gather seed as it ripens, collecting only from the very best flowers. *Dahlias.*—Cover the ground about the roots with very rotten manure; carefully attach them to the stakes as they grow, as a rough wind may destroy all hopes of a bloom, if attention is not paid in this particular.—*J. F. W.*

IV.—PINERIES, VINERIES, &c.

Pineries.—The air is now so genial, that it may be admitted freely to those plants that have been potted from three weeks to a month, keeping at the same time the paths moist by frequent sprinkling. This treatment, with syringing the plants when they are shut up in the afternoon, will encourage a strong growth. Shading slightly during clear sunshine must be still attended to, as the plants suffer materially from the sun when not shaded. Now is a good time for turning out of pots a few plants of those which promise to show soon. They will soon root into the bed, and if supplied occasionally with a little liquid manure, will produce finely swelled fruit during the early part of winter.

Vineries.—Few people think it necessary to shade Vines during hot weather; but it is not at all an uncommon thing to see the foliage severely scorched, to the permanent injury of the plant itself, as well as of the crop upon it at the time. It would be labour well bestowed to shade the more delicate foliaged kinds, particularly where the roof of the house is of a great depth. Be careful to have the Vines quite dry before the sun comes upon them in the morning, as nothing is more injurious to the tissue of the leaves than the action of the sun upon them when moist. This is one reason why I recommend keeping a rather dry atmosphere during the night. The atmosphere of any tolerably well-glazed house will, when shut up, become sufficiently moist for the health of Vines ripening their fruit.

Peach-houses.—Attend well to the cleanliness and health of all the trees, whether in pots or growing in the borders of the houses. Watering well when necessary, and syringing frequently where there is no fruit ripening, are the principal things to attend to now, that too much air can hardly be given, and the wood has nearly done growing.

Cherries.—Plant out in some light friable soil, any small Cherry-trees that have been forced in pots. They will make fine young roots by the time for taking them in again; and if taken carefully up and put into pots somewhat larger than those they are now in, they will be in fine order for forcing. Keep the Cherry-house as cool as possible, give plenty of water, and syringe daily.

Melons.—The plan recommended in last week's Calendar, of supplying water to the roots of the Melons (by means of earthen pipes let into the bed with the lower ends placed upon slates in order to spread the water), we tried for the first time this season, and find it to answer admirably. It is not too late to try it yet with late planted Melons, which have not covered much of the bed. Indeed, we have tried it with a pit just planted, as we are convinced of its utility. Much attention is now required to keep the foliage of Melons clean and healthy. Give a little air early in the morning, increasing it as the day advances.—*G. F.*

V.—HARDY FRUIT AND KITCHEN-GARDEN.

When, owing to the extreme heat, vegetation was again drooping, we have been favoured with another splendid rain. The ground is now in good order for the reception of autumn and winter crops, and no delay should occur in getting a quantity of the forwardest, Savoys, Brussels sprouts, Brocoli, &c., planted out. Those who have got their first Peas cleared off the ground will be so far fortunate; but there are not many places where there is ground enough to enable the gardener to have only one crop on the ground at once. In sowing Peas in rows 5 feet apart, with a row of Early Potatoes between each two rows of Peas, a row of winter-stuff may be planted on each side of the row of Potatoes. From such continuous cropping, you cannot expect to gather many monster heads of Brocoli, &c.; but you will have abundance of a size more suitable for a family. The plants will be a little drawn at first, but they soon become strong and stubby, when the Peas, &c., are removed. Now is a good time to get in the first main crop of Celery. A few trenches will have been previously planted. To save ground, we plant it all in beds, about four feet in width, with ridges of the same width between, sowing a row of Peas along the centre of the ridge, and using the trench for Lettuce, &c., before it is wanted for Celery. The beds intended for late Celery are narrower, they were manured as soon as possible in the spring, and planted with Early Potatoes, which succeeded those in frames, &c. The trenches were formed with a high and low side, resembling a turf-pit, strong stakes were laid across from side to side, upon which common hurdles, wattled with Spruce Fir branches, were drawn up and down, according to the weather. When all danger from frost was over, the hurdles were removed, and became most useful in protecting newly-sown seeds from sun, birds, and flies; and the ridges were turned up, levelled, and sown with Peas, Scarlet Runners, &c. These statements may be useful to the amateur, who is fond of Peas and Celery, and has but little ground at his command. *Routine.*—Sow a good breadth of Cauliflowers on a south border, and you may have Cauliflower late in winter if the season is favourable; also Turnips, Radishes, Endive, Chicory, Spinach, &c.—*R. F.*

VI.—ARBORICULTURE.

Old Woods.—Now, when woods are cleared of all the produce cut during the bark season, little is required to be done except paying attention to keeping fences in good repair, and attending to former directions respecting summer pruning and training young trees.

Coppice.—If these are not yet cleared of all stuff cut during preceding months, the sooner it is done the better, as much injury may be done to young shoots springing from stools recently cut; do not neglect summer management, if you wish a profitable return.

Young Plantations.—If these were properly managed they would make greater progress in growth, and consequently in value, than they generally do. Follow Dr. Thackeray's method—employ a well-instructed person at all seasons, particularly during spring and summer, to regulate and train the summer growth. By the system of going over them once or twice a year only, many things escape attention that want immediate correction, and fresh cases constantly occur. This I know from

experience, and I therefore would endeavour to impress the propriety of Dr. Thackeray's practice on all proprietors of woods.

Nursery Work.—Attend to former directions with regard to watering, shading, weeding, hoeing, and summer-training. Thin out some of the strongest side shoots where they are too numerous, and shorten others, always training to one upright leader.—*W. B.*

VII.—COTTAGERS' CALENDAR.

Those Cottagers who have Vines trained on the cottage, or in other parts of the garden, should examine and carefully regulate their branches, taking care to retain no more young wood, and fruit-bearing shoots, than the Vines are capable of supporting and bringing to maturity. The fruit-bearing branches, if not already done, should now have their tops pinched off, two eyes above the bunch, and the others may also be stopped in the same manner, when they have reached about 20 inches in length. After this stopping, at most of the eyes, they will in all probability throw out laterals, which should be nipped off immediately above the first joint, taking great care, however, not to injure it for fear of prematurely starting the bud at the base. No more shoots should be allowed to remain than are necessary to cover the space that may be for training them. It is always better to keep Vines thin and open, than to crowd the branches together, for loading the plant with a superabundance of wood, only serves to weaken it, and rob the fruit of much of its nourishment. Many of the flowers around the cottage will now be in full bloom, and will therefore require some attention. Notwithstanding the long dry weather, Roses this season are blooming abundantly, and in great perfection; they are also remarkably free from the attacks of insects. Should greenfly, however, be troublesome, they may be got rid of by syringing the plants with ammoniacal liquor, diluted with ten times its bulk of water. From this time to the middle of July, is the best season of the year to increase Roses from layers. The shoots are less brittle now, and on that account are easier to handle than when they are ripe. Take up bulbs, such as Tulips, and Hyacinths, if not already done, when their leaves are decayed, and preserve them dry until autumn; their places may be filled by transplanting a few Annuals from patches that are too thick. Now that we have at last got rain, and the ground in good order, some Brussels sprouts, Savoys, Broccoli, and other things for autumn and winter use, should be got in wherever there is room, and clear away anything in the seed-beds or elsewhere, that is not likely to be wanted. Do not allow the soil to become hard or baked on the surface, but keep it loose and well stirred up; taking care to keep down weeds as soon as they appear, for on the order and neatness in which a cottage garden is kept, much of its beauty and effect depends.—*J. Mc. H*

State of the Weather near London for the week ending June 27, 1844, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 5th, 1836—therm. 94°; and the lowest on the 6th, 1840—therm. 40°.

Notices to Correspondents.

ASPARAGUS.—*A Constant S.*—Salt should be applied 2 or 3 times during the time when the summer shoots are growing fast. Now is an excellent season.

CHEATS.—*Stultus.*—If, as you say, some nurseryman has cheated you by selling rubbishy Cinerarias and Pelargoniums under fine names, you should not deal with him again. We have no means of protecting you.

CONIFERÆ.—*Visto.*—All the sorts you mention are hardy except Pinus longifolia. Plant them out when a foot high, in any exposed situation, and light land.

CUCUMBERS.—*A Reader.*—Your Cucumbers in all probability die off on account of being kept too damp, and for want of sufficient bottom-heat. Keeping them warm and vigorous, and free from sudden checks, is the best preventive. Turn and renew the linings occasionally; do not allow the beds to get crowded with useless Vines, and success is almost certain.‡

GREENHOUSES.—*An Observer* has our thanks; we are endeavouring to obtain a *plan* of the houses in Stirlingshire, when we will publish his letter along with it.

EARWIGS.—*Anti-forficula.*—If you apply oil and turpentine to the stems of your Dahlias it will injure them; and even if it did not hurt the plants, it would not keep off earwigs. You had better trap them by placing inverted pots, having a little dry Moss in them, over the top of the Dahlia stakes. By examining the pots frequently, and killing the insects collected, you may soon get rid of these troublesome vermin ‡

FIGS.—*C. R.*—The figure to which you allude is like all such figures, a diagram, and not a representation of any actual plant. If you look again you will see that it represents the plan of cultivation at Hewell, not at Chiswick, where the trees are all too vigorous. We cannot imagine why you are not satisfied with Mr. Markham's excellent directions, which are thoroughly practical. Cease to gather Rhubarb stalks as soon as Gooseberries are ready for use; the longer you gather them the more the plants will be weakened against another year.

FUCHSIA.—*A Constant Reader.*—Try the following sorts:—Formosa elegans, Exoniensis, Curtisii, Venus Victrix, Gem, Robusta Colossus, Conspicua arborea, Decora, Britannia, Cormackii and Gigantea.*

INSECTS.—*R.C.B.'s* Roses are infested by Anisoplia horticola, a beetle which is very abundant this year, and occasionally does great injury to those flowers. We will make it the subject of a future paper. *R.*——*J.H.C.'s* Elm-leaves are disfigured by a species of Aphis, probably the Eriosoma Ulmi-gallarum. If he would favour us with a leaf or two not crushed by the carriage, we should be enabled to make a drawing, and study the economy of the insect. *R.*——*A Norman.*—Your woolly galls of the Oak are produced by the Cynips Quercus ramuli. *R.*——*B. Chilo.*—Your Spider is Aranea scenica. If Butterflies be held between the finger and thumb when the wings are closed, and gently squeezed, it will deprive them of life without injury, and large Moths may be killed by the application of heat. A cylinder fitting into the top of a small saucepan, having both ends covered with gauze, is a simple mode of admitting a volume of steam to act upon the inclosed insect, and the moment it falls down the cylinder must be removed, and the animal taken out to dry. Harris's "Aurelian" is an interesting work, but it only treats of Lepidoptera, and the nomenclature is defective. *R.*——*M. Saul.* We have every reason to believe that your Corn-maggots will produce the Chlorops pumilionis, and we hope that you and other cultivators will endeavour to rear them, and send us specimens in their different stages. *R.*——*B. Chilo.*—No. 1 is Macroglossa Stellatarum; 2 is Crabo dimidiatus; and 3 is Chrysis ignita, all of which you will find figured or noticed in Curt. Brit. Ent., plates 8, 680, and 747. There is little doubt that the flies were buried by the wasp for its larvæ to feed upon, and we regret that you did not inclose the flies. *R.*——*J. R.*—Your Caterpillars were crushed to pieces, but as we know the depredators, we can tell you that they will change to the "green-veined white Butterfly," Pontia Napi, whose history, &c. you will find in the Royal Agr. Journ., v. iii., p. 312, and pl. F, figs. 17 to 20. *R.*——*Mrs. Waller's* green Saw-fly is the Tenthredo scalaris; the other is the Ctenophora atrata, and being loose in the box it was broken to pieces. *R.*——*Dover.*—Not being able to discover any insects in the box, we conclude your Grapes are eaten off by the Woodlice or by Weevils, which you will ascertain by visiting the greenhouse at night. We wish to be informed if such prove to be the case, and beg that you will send us specimens of the aggressors whatever they may be. *R.*——*N. B.*—We regret being unable to recommend anything more destructive to animal life than the fumes of sulphur. It is said that washing the leaves with soap and water, applying it with the hands, is a certain remedy, and perfectly harmless to vegetation. *R.*——*I. I.*—The aquatic animal is the larva of a Dragon-fly; that infesting your Ribes is a female Coccus. It is the Thrips, we suppose, which is attacking your Melons; we wish it was possible to discover a remedy against that troublesome little plague, but it is said that the fumes of sulphur even are unavailing. *R.*——*A Lady's* Caterpillar with two tails will change to the Puss Moth, named Cerura Vinula. *R.*

MORPHOLOGY.—*T. Elliot.*—Your Roses with the sepals producing branches from their axils are a useful kind of illustration. We should like to ask those who cannot comprehend the principles of Morphology, how they explain such instances without reference to those principles.

NAMES OF PLANTS.—Ἐωσφόρος.—Calonyction speciosum.——*J. C. L.*—Maxillaria Warreana and M. crocea.——*S. Warnford.*—Lotus major, Orobus tuberosus.

OAK BARK.—*A Subscriber.*—After it is peeled make a platform or frame, by driving into the ground forked stakes, about three feet in length, two opposite each other about 18 inches or 2 feet apart in breadth; then lay slender poles lengthways to rest on the forks, and lay the bark on them crossways, reserving the large pieces from the stems or poles for covering it; the large pieces for covering should be spread open while the sap is moist, to lay flat upon the other, lengthways with the frame, keeping the inside downwards to throw off the wet and dew; for when the inside of the bark gets spotted, mildewed, or discoloured, the quality is injured and its value lessened. Bark requires as much care in harvesting as a crop of grain; hence, too much attention cannot be paid to keep the inside from wet and dews from the very commencement; it is soonest injured while the sap is moist. After it has laid on the raised frame sometime, it should be turned, to expedite the drying, first taking the covers carefully off to be replaced as at first. The thinner the bark is laid on the frame the sooner it dries; from 10 to 15 inches in thickness is enough. The time required for drying depends upon the weather and exposure. Bark should always be placed to dry in an exposed place, so as to receive the full benefit of sun and wind. In such a season as this, it requires from two to three weeks; but much depends on whether it is from large trees or coppice poles. When sufficiently dry, it should be delivered to the purchaser, or made into stacks, or put under an open covered building; if in stacks, they should be thatched immediately, and as securely as stacks of grain.—*W. B.*

OLEANDERS.—*A Reader.*—The Oleander is easily propagated by cuttings of the young or half-ripened wood at any time when such can be procured. They may be treated in the ordinary way, and placed either in a Melon-frame or in a pit where they will be kept warm and close. The cuttings require to be kept very moist. The Oleander may also be increased by putting a single cutting into a small phial filled with water in a warm, close situation. It will no doubt succeed well in the way you mention if properly treated now. ¶

PELARGONIUMS.—*Jonathan.*—You will find ample details about their management in our volume for 1841. The French method is in type, and only waiting for space. All Pelargoniums are better for being placed in the open air, for the summer, exposed to the sun, but not so as to be sunburnt.——*A Lady.*—A mixture of two parts turfy loam and one of well-decomposed cow manure, not less than three years old, with a small portion of silver sand, will be found a suitable compost for Pelargoniums.‡——*J. M.*—We are not acquainted with the Pelargonium you have sent as *Comus*, it certainly is not the Queen of the Fairies, for which variety you say it was sold; it appears to be too small for a Show-flower. *

PLANTS.—*T. Jones.*—The following is a list of choice plants for greenhouse cultivation:—Boronia pinnata, serrulata, and anemonefolia; Polygala oppositifolia and cordifolia, Gardoquia Hookeri, Roella ciliata, Hovea celsi and pungens, Chorozema varium, Dicksoni and Henchmanni, Mirbelia floribunda, Aphelexis humilis, Pimelea spectabilis, decussata and hispida, Bossiæa linophylla, Eutaxia myrtifolia, Dillwynia floribunda, Luculia gratissima, Leschenaultia formosa and biloba, Coleonema tenuifolia, Genista canariensis, Sprengelia incarnata, and Crowea saligna, together with the different kinds of Acacia, Correæa, Camellia, and Azalea, &c. Climbers may consist of Kennedya Marryattæ, Hardenbergia monophylla and macrophylla, Sollya linearis, Gompholobium polymorphum, Zichya glabrata, Tropæolum brachyceras, tricolor and azureum, Mandevilla suaveolens, Dolichos lignosus, and Clematis azurea grandiflora. ‡

ROSES.—*J. J. Dilliston.*—Roses do not show well as single flowers. They must be in bunches; but they ought to be tied loosely so as to show the habit of the sort. For kinds we must refer you to the reports of the Chiswick Shows.

ROSES IN POTS.—*Briar.*—We prefer them on their own bottom. If budded, the stocks certainly should not be more than a foot high. If you look to the lists of Roses exhibited by the winners at the Chiswick Shows you will see what force best.

STRAWBERRIES.—*G. I.*—Your fruit was smashed in the Post-office.

THE TULIP-TREE.—*Peter Schlemihl.*—This is sold in all the nurseries, where it is raised from seeds. It is quite hardy, and grows fast. All good soils that are not too heavy and wet, suit it. The wood is light and tough, but is of no great use. The tree is very ornamental.

VINES.—*A Lady* states that in February last she made a new Vine-border, according to directions given in "Roberts's Treatise on the Vine." Her Vines had not borne for two years previously, and the roots, on digging out the border, were found to have penetrated below the good soil far into the marl. They were carefully got up and planted very near the surface; the bottom was well covered with stones, and over that was laid a mixture of lime and gravel. The border was then filled, to the depth of two feet, with rich soil, consisting of well-rotted turf, leaf-mould, stable manure, bones, and a good deal of carrion. About the end of March the Vines broke well, and several of them by the end of April had made shoots six inches long. The house was kept to an even temperature of about 40°, or 45° at night. Very little fire-heat was employed; the Vines were slightly shaded with canvas from the mid-day sun. They, however, began gradually to fail, the buds of the shoots becoming withered and dying away, until now, we are informed, there are only two plants alive, and those make no wood. Upon referring this matter to Mr. Roberts, he gives the following explanation:—It appears that the Vines are old, and that they had penetrated the subsoil, which no doubt produced the failure. After making the new border, which has even been very powerful, I should have preferred planting young Vines in it, as, by proper treatment, they would have produced a crop the whole length of the rafter in the second year after planting. The failure may be attributed to several causes. Was there sufficient caution used in carefully lifting the roots out of the subsoil? Have they not been cut and left destitute of fibres? Although this was the case they might break, and the young shoots, being fed by the sap previously stored up in the old stem and root, would grow to the length of six inches, but as the shoots continued to lengthen, the old roots not being prepared with new fibres, would droop first at the top and gradually wither away, for want of support. The old Vines ought to have been cut down close to the sill, and a gentle heat added to the border, in order to have encouraged them to make new roots before the top broke. Again, has not the carrion been placed too near the surface of the border? This might have suited Vines in perfect health to revel in, but the mutilated roots of old plants would not be in a state to form new fibres in such powerful material, and wherever they came in contact with it they would undoubtedly rot off. If any heating material was applied to the border, too powerful a heat has been kept up, and the roots have been burnt. This, probably, may have been the cause of disappointment. I would recommend that the border be cleared of the old Vines entirely, notwithstanding the advanced season of the year, and replanted with healthy year-old Vines that were cut down this spring, and are still in a free growing state. Take off the eyes and leaves a foot or 15 inches from the bottom of the cane, and lay it in the border, as I recommend in my treatise. When the Vine is at rest, mulch the roots, or add a gentle heat to them, and by judicious treatment with regard to temperature, humidity, &c., there is yet time for good canes to be made and perfectly ripened before winter.——*Hort. Suff.*—Some persons object to syringe Vines as a preventive against red spider, in the morning as well as the evening; but we know no good reason against it; and some of the best Vine-growers do it *morning, noon*, and night. Gardeners say that Vines are scorched in consequence; but experiments are greatly wanted upon this subject. Watering will never destroy red spider so readily as lime and sulphur painted over the flues, and driven into the air by the heat.——*A Constant Subscriber.*—We presume that your Vines are for the present ruined by overbearing. Young Vines cannot carry with impunity such a crop as you speak of. All you now can do is to pull off what bunches they have produced, and treat them to all the air, light, and food you can give them. Certainly discontinue fires. If towards autumn the wood does not ripen, you may then light fires again. But we cannot suppose that it will be necessary. You will have to shorten them very much in the autumn. Read "Roberts on the Vine."

MISCELLANEOUS.—*A Novice.*—We would refer you to Mr. Wood's Papers on Fuchsias, lately given in our columns, where you will find the information you want. Potter's Guano, if concentrated, poured upon the leaves of plants, will injure them; but if weak, it is harmless.‡——*Empty's* Stocks have probably suffered from a cold wind, or some such cause. What has happened is, that one side of the seed-vessels has been injured, while the other has continued growing, the result of which is, of course, a curvature. The seeds will not be the worse for the accident.——*F. X. O.*—The variegation in your Mountain Ash is surely very ugly.——*T. Jones.*—You must have patience; your young Melon plants, although in good health, are unable to set their flowers until they have made considerable progress in growth. As soon as they are old enough, if attention is paid to fertilise the females, you will no doubt be more successful. You have kept your Ipomœa much too dry; the red spider is prevented by keeping a damp atmosphere, or killed by the application of fumes of sulphur.‡——*A Subscriber.*—Orange trees like the very strongest manure. A compost consisting of one-third rough charcoal and blood, and two-third good turfy-loam, is a suitable soil for them. For information regarding the construction of a fruit-room, see Leaders, pages 611 and 643, vol. 1841.‡——*Cautus.*—We are unable to answer your question. Of course, if you infringe any patent you must take the consequences.——*J. S. J.*—1*s.* 2*d.*——*Denton.*—Having a two-light frame, you may have young Potatoes at Christmas by planting in the beginning of September. The new rose-coloured winter Radish should be sown in August. We presume the early Pea to which you allude as being grown near Gravesend and Rochester, is the early Charlton.‡

SEEDLING FLORISTS' FLOWERS.

ANAGALLIS.—*A. B.*—Your specimen of an Anagallis was too dried up: it was impossible to form an opinion of its qualities.*

CALCEOLARIAS.—*C.N.*—Your seedlings are very fair specimens. 3 is decidedly the best in form and colour; 2 is very common; and 1 wants decision of colour.*

FUCHSIAS.—*A. B.*—If your seedling is a free bloomer, it must be a handsome plant; the colour is not novel, being similar to most seedlings from splendens; but the length of the flower, 4½ inches, with the slender tubes, if flowering in bunches, must give the plant a curious appearance.*——*J. Y.*—The colour, form, and substance of your seedling makes a handsome variety.*

GERANIUM.—*W. J. T.*—Your seedling is very brilliant, but not superior to some of the varieties in cultivation; its value depends upon its being of dwarf habit, combined with freedom of flowering.*

MIMULUS.—*Devoniensis.*—Your seedling variety is not uncommon.*

PELARGONIUMS.—*J. M. W.*—The seedling you have sent wants form and substance; and with these drawbacks we certainly cannot recommend it as a parent. There are many rich and highly-coloured flowers that would answer the purpose much better.*——*C. W.*—William the Conqueror is large and showy, but very deficient in form, and wanting in substance.* *S. E. M.*—The form of your seedling is very good; the upper petals are too uneven and puckered at the edges, but the flower possesses substance and form; the colour is not uncommon.*——*A. B.*—Judging of your seedlings from the loose petals, they are of no value; they are all so deficient in substance.*——*W. M.*—Pompey is a stout flower, of good form, with broad pink under-petals; the upper petals have a deep blotch, which is surrounded with crimson, leaving a margin of delicate pink. Champion has rosy crimson under-petals, terminating in the centre with a tinge of blue; the top petals have a large rich spot, which gradually softens to the edge. Unique has top-petals covered with deep maroon, leaving a narrow margin of rosy purple, white centre, with delicate pink under-petals, upon which are seen rosy purple veins—three flowers of good substance, size, and variety.*

PETUNIAS.—*A. Z.*—From your seedlings being badly packed, the blooms were much bruised; the colour of 32 is very fine, being a splendid dark purple; and next to this we prefer the darkest of the light blues. The other varieties do not appear to be sufficiently distinct; we should like to see blooms of these again. *

ERRATUM.—In last week's Paper, p. 404, in article "Statice Pseudo-armeria," the signature should be *E. Barnacle*, and not *E. Barmall*, as is there printed.

*** As usual, many communications have been received too late

IMPORTANT to AGRICULTURISTS.—ANALYSES of SOILS, MANURES, and all AGRICULTURAL PRODUCTS, are conducted by Mr. MITCHELL, Analytical Chemist (late of the Royal Polytechnic Institution), with the view of ascertaining whether the soil on which it is proposed to grow any particular crop contains all that is necessary to produce a luxuriant vegetation; also to estimate the relative value and purity of Manures, and the comparative worth of Farm Produce in general.

Gentlemen Instructed in Agricultural Chemistry; the Course will comprehend the Elements of Analysis.

No. 5A, Hawley-road, Kentish Town.

The Agricultural Gazette.

SATURDAY, JUNE 29. 1844.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July 3 Agricultural Society of England.
THURSDAY, July 4 Agricultural Imp. Soc. of Ireland.
WEDNESDAY, July 10 Agricultural Society of England.
THURSDAY, July 11 Agricultural Imp. Soc. of Ireland.
FARMERS' CLUBS.—July 1, W. Market.

IT is obvious that, were there no other consideration than that of the GROWTH OF THE TURNIP-CROP, to affect the determination of the farmer as to the mode of its cultivation, the best arrangement of the plants on the ground would be one of equi-distance between them, so that whatever distance might be fixed upon, whether 10, 12, or 14 inches, the ground being supposed divided into squares of that dimension, the plants should be placed one in the centre of each. They would thus all be situated on equal terms, in relation to the sources of their nourishment, and there would in all probability be a uniformly productive yield.

The object of a root-crop, however, as may be gathered from the name of the class under which it comes—the object of a *fallow* crop—is not merely the growth of a great quantity of food of good quality for stock; the cleansing of the land, and its preparation for the succeeding grain crop, are to be effected during its growth; and it is therefore necessary to modify the otherwise advisable equi-distant arrangement of the plants, so as to enable the farmer the better to cultivate the land during their growth. Instead of scattering the seed at equal intervals all over the field, as a good broad-cast sower, he is thus required to sow it in rows, at such intervals as may enable him to use the horse-hoe or plough. This width varies from 20 to 30 inches. The best distance, it is evident, must be the least at which the land can be properly cultivated—the least, compatible with the efficient use of the implements we have named.

The same reason which renders the drill husbandry of Turnips superior to the broadcast system, renders the ridge-drill mode of cultivation superior to that on the flat surface. The first act of cultivation which the land receives after the Turnip-seed is sown should be a horse-hoeing between the rows while the young plants are assuming their rough leaves. The rows are after that more easily broken by the hoe when the plants are being singled out, and thus that operation is cheapened. But it is evident that this could not be done without great danger of burying the young plants when the flat-drill system is adopted: whereas, when the seed is sown on the tops of the ridges, the stirring of the soil causes it to roll away from the plants, so that ultimately the land loses its ridged appearance, and the plants are in no danger of being buried.

As soon as the young Turnip-plants have assumed their rough leaves, they should be singled out to a distance of 12 or 14 inches; it is manifestly of greater importance to increase the size than to increase the number of the roots. The crop per acre will be increased in weight four times as much by doubling the diameter of the roots as it would by doubling their number; and it is therefore of importance to allow as much room for each plant to grow in as its full size requires. The operation of hand-hoeing, when singling the plants out, does not require to be performed gently; indeed, a little roughness in handling the young plant is found to be beneficial. The earth should be pushed and pulled *from* it; and though it be left with an inch in length of its root exposed, it will not be injured thereby.

It is impossible to overrate the importance of the operation of horse-hoeing the land during the growth of the Turnip-crop. Not only is the vigorous growth of the roots thereby insured, but the land is cleaned and enriched for the grain crop of the following year. We say enriched, because by this operation the fibrous roots of the plants are enabled and encouraged to permeate the whole soil, so as to leave it filled full of vegetable matter when the crop is removed. We have seen fields so well cultivated in this way, that a handful of earth could not be taken up in it which was not full of these silken-looking fibres; and so vigorous was the growth of the crop in that field, that on digging a pit in one, these fibres (recognised by their appearance and taste) were found to have penetrated to a depth of five feet!

We conclude by quoting from an excellent paper by Mr. B. Almack on this subject, in the fourth volume of the "English Agricultural Society's Journal," the following effects of the drill system of husbandry in the East Riding of Yorkshire, "as increasing the produce of the land in that district, and employing its industrious population. Within the last forty years the wolds of Yorkshire were considered quite unfit for the growth of Wheat, but now they grow fully as good crops of Wheat per acre as the average of the kingdom. As a sample of the change in this respect, a friend of mine sold the late occupier of a farm Wheat for the use of his family, because the farm did not then grow sufficient for the use of his family. Both the parties I allude to lived to see that farm grow Wheat, 100 acres together, which was supposed by the best judge to have 5 quarters per acre. I do not say the farm grows, on an average, 5 quarters of Wheat per acre, but the crops of Wheat on it will generally be found decidedly above the average of England; and all this resulted from *high* cultivation *long* continued."

ON FEEDING CATTLE IN HOUSES OR IN OPEN SHEDS.

NOTWITHSTANDING the rapid advances towards perfection which have been made in the practice of Agriculture within the present century, the continued application of scientific research, and of minute observation to the routine of practice, frequently shows that even in departments in which the propriety of established usage was considered to be beyond question, much still remains to be learned. Experiments, when properly conducted, are the life and soul of husbandry, as enabling the practical farmer to test the comparative merits of different systems of management, and also to ascertain the value of the suggestions of men of science. But in order to be of any use, it is obvious that all the circumstances attending their execution should be accurately taken into consideration, in drawing from them any practical conclusions: without this they are not merely valueless but mischievous in their tendency, and calculated to mislead, by the establishment of practice founded on incorrect data. Any accurate observer cannot fail to perceive that more than one half of the experiments in practical Agriculture, from time to time recorded, are greatly deficient in the detail of the various circumstances by which the results of all such trials are effected; and that, strictly speaking, they should go for nothing as regards the purpose for which they were instituted. Until, therefore, a greater degree of attention is paid to this subject, that value cannot be attached to this department of agricultural improvement to which it would otherwise be entitled.

These considerations have presented themselves on contrasting the almost universal practice at the present day among the farmers of the northern part of the island, as regards the management of their cattle, with the researches and deductions of the celebrated German philosopher, Liebig, in the rich and important field of Organic Chemistry. The practice of feeding cattle in open sheds, in preference to close houses, is now almost universal in certain districts of Scotland, and is daily gaining ground, although reasonable and well-founded doubts may be entertained of its propriety. It was not, however, hastily adopted by the Scotch farmers, without consideration; this would, indeed, be inconsistent with their character and habits. Numerous experiments were performed with the view of correctly ascertaining the relative merits of the two plans, the greater part, if not the whole, of which were favourable to the open sheds; and this satisfactorily accounts for the increasing favour with which that system of management is received.

Should it appear, however, that the results which have led to the general adoption of this practice have been founded on incorrect conclusions, and that the contrary practice is, in reality, that which accurate observation would tend to establish, it is evidently of much importance that all doubts on such a momentous subject should be removed. The practice of the Scottish farmers is usually considered as the most perfect in the world, and a plan of management regarding the propriety of which so little, if any, difference of opinion exists among them, it may be believed will be rapidly introduced into other less favoured districts; but it would appear that further and more accurate trials are wanting before any course of management so directly at variance with what may be regarded as the established phenomena of the animal economy can be recommended for universal adoption.

However erroneous many of the conclusions may have been at which the physiologists of other days arrived in their investigations of the phenomena of animal life, their successful elucidation does not now seem matter of doubt. Regarding the sources of animal heat and nutrition no question can be entertained, and the various circumstances by which they are affected seem also to be perfectly ascertained. The production of fat can only take place when the various matters which enter the system are not expended in its maintenance. Whether in the evolution of heat, or of the usual animal secretions, exercise is well known to be conducive to an increased consumption of food; so that it is obviously unfavourable to the accumulation of fat, however necessary it may be in the case of growing animals, in which the proper and rapid development of the system is the primary consideration. Heat also is only maintained by the expenditure of some of the most important of the animal solids; so that any circumstances in which this is rapidly abstracted must further be regarded as inimical to the objects of the feeder. But both these conditions—rest, and an equable, or rather warm temperature—would seem to be obtained more efficiently when animals are confined to their stalls than when placed in open yards, where, to a certain extent, very considerable exercise may be taken, and where the necessary exposure to the piercing winds and cool atmosphere of the winter season cause a considerable abstraction of heat from the animal body, the reproduction of which is unfavourable to the accumulation of flesh and fat.

This will, perhaps, be more apparent from a consideration of the constituents of the food of graminivorous animals, and the part fulfilled by each in the animal economy. It is well known that all parts of the body have been originally produced, and are constantly maintained in healthy action, by the blood, which, by a wonderful arrangement, permeates every part of the system, and from which various secretions are constantly taking place through the instrumentality of the skin, kidneys, and other agents. Every one is also familiar with the necessity of the presence of the atmospheric air for the support of animal life, the oxygen of which enters into combination with the carbon of the blood, and is given off in the form of carbonic acid gas, the remaining constituent of the atmosphere, nitrogen, being again exhaled without change. The constant and copious inhalation of oxygen, which is constantly going on during every period of existence, must therefore be attended by an equivalent waste of carbon in the proportion in which these two elementary substances combine to form carbonic acid gas. A portion of the oxygen thus inhaled also combines with hydrogen in the system, and is given out in the vapour of water. The oxygen taken in being, therefore, given off in combination with carbon and hydrogen, and these being supplied by the food, it is obvious that the quantity of food required will in a great degree depend on the extent to which the former is inhaled. Exertion produces increased respiration, or causes an additional quantity of oxygen to be inhaled, which must be followed by an increased abstraction of carbon and hydrogen. Though necessary for the support of animal life, it is thus seen that the inhalation of oxygen is attended by very considerable waste of other ingredients, and the circumstances in which the minimum quantity of this substance is taken into the system are those most favourable to the accumulation of fat. But the extent or volume taken in at each inspiration being constant, depending on the capacity of the chest, it is evident that a greater quantity will be inhaled in cold weather than in warm, in winter than in summer; and hence, in the former cases, an increased quantity of food will be consumed to make up for the waste thus occasioned. This circumstance readily accounts for the human race, in polar regions, using the strongest animal food, revolting even to the inhabitants of temperate climates; and why, in the latter case, vegetables and fruits form the chief food of mankind.

The combination of oxygen and carbon is further attended by the evolution of heat. This is familiar to every one in the process of combustion; and although not so readily apparent in the case of their combination in the animal system, yet Professor Liebig has shown that precisely the same amount of heat is disengaged in the latter case as in the former; and this is the true source of animal heat. The temperature of the body, therefore, it appears, depends on the quantity of oxygen taken into the system. But the need of food has also been seen to be regulated by the same cause; and hence the deduction, that keeping up a high temperature, either by clothing or a warm atmosphere, is to a certain extent an equivalent for food. The heat of animals respiring rapidly will be found to be greater than of those respiring more slowly—that of an infant being greater than of an adult—of birds being greater than of quadrupeds,—while that of fishes, whose respiration is so inconsiderable, is little greater than that of the surrounding waters.

The blood of animals, through the instrumentality of which the various processes of nutrition are effected, is known to be composed of fibrine and albumen; the former being identical in its composition with muscular fibre, and constituting the solid portion of the blood, and the latter being similar to the white of eggs in its properties. These two substances comprehend in their composition the various elementary matters constituting the different organs of the animal body. Fibrine and albumen are obtained by the coagulation of the blood, when they separate from each other—phenomena with which every one is familiar. But what is still more remarkable, these substances, though so apparently dissimilar, are identical in composition, containing the same elementary matters in precisely equal proportions—their particles being merely arranged in a different order. The former is even capable of being resolved into the latter; and both, in the process of nutrition, are converted into muscular fibre.

The elementary matters of which blood is composed are, further, precisely the same as those constituting the organisation of vegetables—namely, oxygen, hydrogen, carbon, and nitrogen, with sulphur, phosphorus, and metallic and earthy salts. Were this not the case, animals could not be supported on vegetable food, it being clearly ascertained that the animal economy is totally incapable of producing an elementary substance from matters which do not contain it. The fat of animals is widely different from the other parts of the body, not only in external appearance, but also in composition; it can hardly, indeed, be said to be organised, being an amorphous mass, and, further, being the only part of the system destitute of nitrogen. Nitrogen is, however, an essential constituent of all the nutritious parts of vegetables, or those capable of supporting animal life; it is, in fact, to the presence of this substance that the various kinds of grain and pulse owe the nutritive properties for which they are so highly valued. The nitrogenised compound

of plants—their fibrine, albumen, and caseine—may be obtained without difficulty by the amateur desirous of investigating their properties for himself. Vegetable fibrine may be obtained in a state of tolerable purity from Wheat-flour, by mechanical means, with water, it being insoluble. The albumen is obtained from the juices of various plants—cruciferous plants especially; and is found in great abundance also in Nuts and Almonds, in which a peculiar kind of oil takes the place of starch, so abundant in the seeds of gramineous plants. Caseine is found in leguminous seeds, and, like albumen, is soluble in water; but the solution is not affected by heat. These three substances, though differing in their mechanical properties, are found to be identical in composition, not only with each other, but also with the chief constituents of blood—animal fibrine, and albumen. The salts of iron, present to a greater or less extent in vegetables, supply the blood with its colouring matter; and their earthy salts contain the ingredients necessary for the formation of bone.

The nitrogenised compounds of vegetables, therefore, are those only which supply the animal system with the materials required for reproduction or the supply of waste; and from the foregoing observations it will be seen how admirably they are adapted for that purpose. But it has been seen that a large expenditure of carbon and hydrogen is also taking place during every moment of existence, by respiration; and for the supply of these, uncombined with nitrogen, these compounds do not make provision. It is from vegetable substances, in which nitrogen is not present, that the supply to meet such expenditure must be obtained; and such substances, accordingly, form a large proportion of the food of gramineous animals. In the earliest stages of existence these are supplied by the mother's milk, the caseine of which supplies the constituents of blood; and the butter, and remaining ingredient, known as sugar of milk, supply the carbon destined to be consumed in the respiratory process. As the young animal advances in growth, the nitrogenised compounds of plants furnish the former, and those abounding in starch, gum, or sugar, furnish the latter. The similarity of composition of these substances is well known; starch is, indeed, capable of being converted into sugar by very simple means, as in the process of malting, or by the addition of acids.—*J. Sproule.*
